The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services (see inside front cover).
Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published biannually under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies and of the UK Health Departments. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association. The Nurse Prescribers' Advisory Group advises on the content relevant to nurses.

The BNF aims to provide prescribers, pharmacists and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers' product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF's recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services (see inside front cover).

It is vital to use the most recent edition of the BNF for making clinical decisions. The more important changes for this edition are listed on p. xvi.

The website (bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including intranet and versions for mobile devices—are produced in parallel with the printed version.

The BNF welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:
British National Formulary,

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this edition were:

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, R.A. Seymour, R. Welbury, and M.J. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Members of the British Association of Dermatologists’ Therapy & Guidelines Subcommittee, D.A. Buckley, L.C. Fuller, J. Hughes, S.E. Hulley, J. Lear, A.J. McDo- nghag, J. McLelland, N. Morar, I. Nasr, S. Punjabi, M.J. Tidman, S.E. Haveron (Secretariat), and M.F. Mohd Mustapa (Secretariat) have provided valuable advice.

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, P.L. Chiodini, F. Genasi, L. Good- yer, A. Green, D. Hill, G. Kassianos, D.G. Lalico, G. Pas- vol, S. Patel, M. Powell, D.V. Shingadia, C.J.M. Whitby, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

Members of the UK Ophthalmic Pharmacy Group have also provided valuable advice.

The Joint British Societies’ Coronary Risk Prediction Charts have been reproduced with the kind permission of P.N. Durrington who has also provided the BNF with access to the computer program for assessing coronary and stroke risk.

R. Suvarna and colleagues at the MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF. NHS Prescription Services has supplied the prices of products in the BNF.

Numerous doctors, pharmacists, nurses and others have sent comments and suggestions.

How the BNF is constructed

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information, enabling healthcare professionals to select safe and effective medicines for individual patients.

Information in the BNF has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts.

Hundreds of changes are made between editions, and the most clinically significant changes are listed at the front of each edition (pp. xvi–xviii).

Joint Formulary Committee

The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes doctors appointed by the BMJ Publishing Group, pharmacists appointed by the Royal Pharmaceutical Society, and representatives from the Medicines and Healthcare products Regulatory Agency (MHRA) and the UK health departments. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice. The Committee meets quarterly and each member also receives proofs of all BNF chapters for review before publication.

Editorial team

BNF staff editors are pharmacists with a sound understanding of how drugs are used in clinical practice. Each staff editor is responsible for editing, maintaining, and updating specific chapters of the BNF. During the publication cycle the staff editors review information in the BNF against a variety of sources (see below).

Amendments to the text are drafted when the editors are satisfied that any new information is reliable and relevant. The draft amendments are passed to expert advisers for comment and for assimilation into the BNF. Additionally, for each edition, sections are chosen from every chapter for thorough review. These planned reviews aim to verify all the information in the selected sections and to draft any amendments to reflect the current best practice.

Staff editors prepare the text for publication and undertake a number of checks on the knowledge at various stages of the production.

Expert advisers

The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with the production of each edition. The role of these expert advisers is to review existing text and to comment on amendments drafted by the staff editors. These clinical experts help to ensure that the BNF remains reliable by:

- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on areas where the BNF diverges from summaries of product characteristics;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF also works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are routinely received for comment and for assimilation into the BNF.

Sources of BNF information

The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics The BNF receives summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed, despite the ever-increasing volume of information being issued by the pharmaceutical industry. Such processing involves:

- verifying the approved names of all relevant ingredients including ‘non-active’ ingredients (the BNF is committed to using approved names and descriptions as laid down by the Medicines Act);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs.

Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;

- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by two staff editors before submitting to a senior editor; changes relating to doses receive an extra check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- careful validation of any areas of divergence of the BNF from the SPC before discussion by the Committee (in the light of supporting evidence);

- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs. Much of this processing is applicable to the following sources as well.

Expert advisers The role of expert clinical advisers in providing the appropriate clinical context for all BNF information is discussed above.
Literature  Staff editors monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

Systematic reviews The BNF has access to various databases of systematic reviews (including the Cochrane Library and various web-based resources). These are used for answering specific queries, for reviewing existing text and for constructing new text. Staff editors receive training in critical appraisal, literature evaluation, and search strategies. Reviews published in Clinical Evidence are used to validate BNF advice.

Consensus guidelines The advice in the BNF is checked against consensus guidelines produced by expert bodies. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Clinical Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces Martindale: The Complete Drug Reference. The BNF has access to Martindale information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Statutory information The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescription only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Medicines Act. The BNF itself is named as an official compendium in the Medicines Act.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug use issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

The BNF reflects information from the Drug Tariff, the Scottish Drug Tariff, and the Northern Ireland Drug Tariff.

Pricing information NHS Prescription Services (from the NHS Business Services Authority) provides information on prices of medicinal products and appliances in the BNF.

Comments from readers Readers of the BNF are invited to send in comments. Numerous letters and emails are received during the preparation of each edition. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

Comments from industry Close scrutiny of the BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about the BNF’s presentation of the role of various drugs; this is yet another check on the balance of the BNF’s advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Virtual user groups The BNF has set up virtual user groups across various healthcare professions (e.g. doctors, pharmacists, nurses, dentists). The aim of these groups will be to provide feedback to the editors and publishers to ensure that BNF publications continue to serve the needs of its users.

Market research Market research is conducted at regular intervals to gather feedback on specific areas of development, such as drug interactions or changes to the way information is presented in digital formats.

The BNF is an independent professional publication that is kept up-to-date and addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.
How to Use the BNF

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in each new edition of the BNF that are relevant to their clinical practice. How to Use the BNF is aimed as a quick refresher for all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, and as a learning aid for students training to join these professions. While How to Use the BNF is linked to the main elements of rational prescribing, the generic structure of this section means that it can be adapted for teaching and learning in different clinical settings.

Structure of the BNF

The Contents list (on p. iii) shows that information in the BNF is divided into:

- How the BNF is Constructed (p. vii);
- Changes for this Edition (p. xvi);
- Guidance on Prescribing (p. 1), which provides practical information on many aspects of prescribing from writing a prescription to prescribing in palliative care;
- Emergency Treatment of Poisoning (p. 52), which provides an overview on the management of acute poisoning;
- Classified notes on clinical conditions, drugs, and preparations; these notes are divided into 15 chapters, each of which is related to a particular system of the body (e.g. chapter 2, Cardiovascular System) or to an aspect of medical care (e.g. chapter 5, Infections). Each chapter is further divided into classified sections. Each section usually begins with prescribing notes followed by relevant drug monographs and preparations (see fig. 1). Drugs are classified in a section according to their pharmacology and therapeutic use;
- Appendices and Indices, includes 5 Appendices (providing information on drug interactions, intravenous additives, Borderline substances, wound management, and cautionary and advisory labels for dispensed medicines), the Dental Practitioners’ Formulary, the Nurse Prescribers’ Formulary, Non-medical Prescribing, Index of Manufacturers, and the main Index. The information in the Appendices should be used in conjunction with relevant information in the chapters.

Finding information in the BNF

The BNF includes a number of aids to help access relevant information:

- Index (p. 990), where entries are included in alphabetical order of non-proprietary drug names, proprietary drug names, clinical conditions, and prescribing topics. A specific entry for ‘Dental Prescribing’ brings together topics of relevance to dental surgeons. The page reference to the drug monograph is shown in bold type. References to drugs in Appendices 1 and 9 are not included in the main Index;
- Contents (p. iii), provides a hierarchy of how information in the BNF is organised;
- The beginning of each chapter includes a classified hierarchy of how information is organised in that chapter;
- Running heads, located next to the page number on the top of each page, show the section of the BNF that is being used;
- Thumbnails, on the outer edge of each page, show the chapter of the BNF that is being used;
- Cross-references, lead to additional relevant information in other parts of the BNF.

Finding dental information in the BNF

Extra signposts have been added to help access dental information in the BNF:

- Prescribing in Dental Practice (p. 26), includes a contents list dedicated to drugs and topics of relevance to dentists, together with cross-references to the prescribing notes in the appropriate sections of the BNF. For example, a review of this list shows that information on the local treatment of oral infections is located in chapter 12 (Ear, Nose, and Oropharynx) while information on the systemic treatment of these infections is found in chapter 5 (Infections). This section also includes advice on Medical Emergencies in Dental Practice (p. 26) and Medical Problems in Dental Practice (p. 28). Guidance on the prevention of endocarditis and advice on the management of anticoagulated patients undergoing dental surgery can also be found here;
- Side-headings, in the prescribing notes, side-headings facilitate the identification of advice on oral conditions (e.g. Dental and Orofacial Pain, p. 257);
- Dental prescribing on NHS, in the body of the BNF, preparations that can be prescribed using NHS form FP10D (GP14 in Scotland, WP10D in Wales) can be identified by means of a note headed ‘Dental prescribing on NHS’ (e.g. Aciclovir Tablets, p. 593).

Identifying effective drug treatments

The prescribing notes in the BNF provide an overview of the drug management of common conditions and facilitate rapid appraisal of treatment options (e.g. hypertension, p. 104). For ease of use, information on the management of certain conditions has been tabulated (e.g. acute asthma, p. 173). Information is also provided on the prevention of disease (e.g. malaria prophylaxis for travellers, p. 404). Cardiovascular risk prediction charts for the primary prevention of cardiovascular disease can be found in the glossy pages at the back of the BNF.

Advice issued by the National Institute for Health and Clinical Excellence (NICE) is integrated within the BNF prescribing notes if appropriate. Summaries of NICE technology appraisals, and relevant short guidelines, are included in blue panels. The BNF also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland.

In order to select safe and effective medicines for individual patients, information in the prescribing notes must be used in conjunction with other pre-
scribing details about the drugs and knowledge of the patient's medical and drug history.

A brief description of the clinical uses of a drug can usually be found in the Indications section of its monograph (e.g. bendroflumethiazide, p. 84); a cross-reference is provided to any indications for that drug that are covered in other sections of the BNF.

The symbol is used to denote preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing. Although such preparations may not be considered as drugs of first choice, their use may nevertheless be justifiable in certain circumstances.

Figure 1 Illustrates the typical layout of a drug monograph and preparation records within these pages.

**Drug management of medical emergencies**

Guidance on the drug management of medical emergencies can be found in the relevant BNF chapters (e.g. treatment of anaphylaxis is included in section 3.4.3); advice on the management of medical emergencies in dental practice can be found in Prescribing in Dental Practice, p. 26. A summary of drug doses used for Medical Emergencies in the Community can be found in the glossy pages at the back of the BNF. An algorithm for Adult Advanced Life Support can also be found within these pages.
Minimising harm in patients with co-morbidities

The drug chosen to treat a particular condition should have minimal detrimental effects on the patient's other diseases and minimise the patient's susceptibility to adverse effects. To achieve this, the Cautions, Contra-indications, and Side-effects of the relevant drug should be reviewed, and can usually be found in the drug monograph. However, if a class of drugs (e.g. tetracyclines, p. 346) share the same cautions, contra-indications, and side-effects, these are amalgamated in the prescribing notes while those unique to a particular drug in that class are included in its individual drug monograph. Occasionally, the cautions, contra-indications, and side-effects may be included within a preparation record if they are specific to that preparation or if the preparation is not accompanied by a monograph.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient's quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia. The prescribing notes in the BNF may highlight important safety concerns and differences between drugs in their ability to cause certain side-effects.

Prescribing for patients with hepatic or renal impairment

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in Hepatic Impairment (p. 17) and Prescribing in Renal Impairment (p. 17). Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under Hepatic Impairment and Renal Impairment (e.g. fluconazole, p. 374). However, if a class of drugs (e.g. tetracyclines, p. 346) share the same recommendations for use in hepatic disease or renal impairment, this advice is presented in the prescribing notes under Hepatic Impairment and Renal Impairment and any advice that is unique to a particular drug in that class is included in its individual drug monograph.

Prescribing for patients who are pregnant or breast-feeding

Drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in Pregnancy (p. 19) and Prescribing in Breast-feeding (p. 19). The prescribing notes in the BNF chapters provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. asthma, p. 170). Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under Pregnancy and Breast-feeding (e.g. fluconazole, p. 374). However, if a class of drugs (e.g. tetracyclines, p. 346) share the same recommendations for use during pregnancy or breast-feeding, this advice is amalgamated in the prescribing notes under Pregnancy and Breast-feeding while any advice that is unique to a particular drug in that class is included in its individual drug monograph.

Minimising drug interactions

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1 (p. 800). Details of drug interactions can be found in Appendix 1 of the BNF (p. 801). Drugs and their interactions are listed in alphabetical order of the non-proprietary drug name, and cross-references to drug classes are provided where appropriate. Each drug or drug class is listed twice: in the alphabetical list and also against the drug or class with which it interacts. The symbol ● is placed against interactions that are potentially serious and where combined administration of drugs should be avoided (or only undertaken with caution and appropriate monitoring). Interactions that have no symbol do not usually have serious consequences.

If a drug or drug class has interactions, a cross reference to where these can be found in Appendix 1 is provided under the Cautions of the drug monograph or prescribing notes.

Prescribing for the elderly

General guidance on prescribing for the elderly can be found on p. 24.

Prescribing for children

General guidance on prescribing for children can be found on p. 15. For detailed advice on medicines used in children, consult BNF for Children.

Selecting the dose

The drug dose is usually located in the Dose section of the drug monograph or preparation record. The dose of a drug may vary according to different indications and routes of administration. If no indication is given by the dose, then that dose can be used for the conditions specified in the Indications section of that drug monograph, but not for the conditions cross-referring to other sections of the BNF. The dose is located within the preparation record when the dose varies according to different formulations of that drug (e.g. amphotericin, p. 378) or when a preparation has a dose different to that in its monograph (e.g. Sporanox® liquid, p. 376). Occasionally, drug doses may be included in the prescribing notes for practical reasons (e.g. doses of drugs in Helicobacter pylori eradication regimens, p. 50). The right dose should be selected for the right indication, route of administration, and preparation.
Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the patient should receive 2 g 3 times daily).

The doses of some drugs may need to be adjusted if their effects are altered by concomitant use with other drugs, or in patients with hepatic or renal impairment (see Minimising Drug Interactions, and Prescribing for Patients with Hepatic or Renal Impairment).

Doses for specific patient groups (e.g. the elderly) may be included if they are different to the standard dose. Doses for children can be identified by the terms NEO-NATE, INFANT, and CHILD, and will vary according to their age or body-weight.

Conversions for imperial to metric measures can be found in the glossy pages at the back of the BNF.

Selecting a suitable preparation

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration.

In the BNF, preparations usually follow immediately after the monograph for the drug which is their main ingredient. The preparation record (see fig. 1) provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription only medicines and controlled drugs; any exception to the legal status is shown by a Note immediately after the preparation record or a footnote. If a proprietary preparation has a distinct colour, coating, scoring, or flavour, this is shown in the preparation record. If a proprietary preparation includes excipients usually specified in the BNF (see p. 2), these are shown in the Excipients statement, and if it contains clinically significant quantities of electrolytes, these are usually shown in the Electrolytes statement.

Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where a drug has several preparations, those of a similar type may be grouped together under a heading (e.g. 'Modified-release' for theophylline preparations, p. 181). Where there is good evidence to show that the preparations for a particular drug are not interchangeable, this is stated in a Note either in the Dose section of the monograph or by the group of preparations affected. When the dose of a drug varies according to different formulations of that drug, the right dose should be prescribed for the preparation selected.

In the case of compound preparations, the prescribing information of all constituents should be taken into account for prescribing.

Writing prescriptions

Guidance is provided on writing prescriptions that will help to reduce medication errors, see p. 5. Prescription requirements for controlled drugs are also specified on p. 8.

Administering drugs

If a drug can be given parenterally or by more than one route, the Dose section in the monograph or preparation record provides basic information on the route of administration. Further information on administration may be found in the monograph or preparation record, often as a Note or Counselling advice. If a class of drugs (e.g. topical corticosteroids, p. 708) share the same administration advice, this may be presented in the prescribing notes.

Appendix 6 (p. 892) provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates.

Advising patients

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see Taking Medicines to Best Effect, p. 1). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline); this is shown in Counselling statements, usually in the Cautions or Dose section of a monograph, or within a preparation record if it is specific to that preparation.

Patients should be advised if treatment is likely to affect their ability to drive or operate machinery. Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the preparation record (see fig. 1). Details of these labels can be found in Appendix 9 (p. 957), a list of products and their labels is included in alphabetical order of the non-proprietary and proprietary drug names.

Monitoring drug treatment

Patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The prescribing notes or the Cautions in the drug monograph specify any special monitoring requirements. Further information on monitoring the plasma concentration of drugs with a narrow therapeutic index can be found as a Note under the Dose section of the drug monograph.

Identifying and reporting adverse drug reactions

Clinically relevant Side-effects for most drugs are included in the monographs. However, if a class of drugs (e.g. tetracyclines, p. 346) share the same side-effects, these are presented in the prescribing notes while those unique to a particular drug in that class are included in its individual drug monograph. Occa-
nationally, side-effects may be included within a preparation record if they are specific to that preparation or if the preparation is not accompanied by a monograph.

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness. The frequency of side-effects is described in fig. 1.

An exhaustive list of side-effects is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is generally not listed, unless the drug carries an increased risk of such reactions. The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

The prescribing notes in the BNF may highlight important safety concerns and differences between drugs in their ability to cause certain side-effects. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) can also be found here or in the drug monographs.

Adverse Reactions to Drugs (p. 12) provides advice on preventing adverse drug reactions, and guidance on reporting adverse drug reactions to the MHRA. The black triangle symbol \( \blacktriangle \) identifies those preparations in the BNF that are monitored intensively by the MHRA.

Finding significant changes in a new edition

The BNF is published in March and September each year and includes lists of changes in a new edition that are relevant to clinical practice:

- The print version includes an Insert that summarises the background to several key changes. A copy of the Insert can also be found at bnf.org in the section on Updates under ‘What’s new in BNF?’;
- Changes for this edition (p. xvi), provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into a new edition, as well as a list of preparations that have been discontinued since the last edition. For ease of identification, the margins of these pages are marked in blue;
- Changes to the Dental Practitioners’ Formulary (p. 973), these are located at the end of the Dental List;
- Changes to the Appendices, drug entries that have been amended or introduced since the previous edition in Appendix 1 (Drug Interactions) or Appendix 9 (Cautionary and Advisory Labels for Dispensed Medicines) are underlined in the print versions;
- E-newsletter, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies and provide tips on using these publications effectively. To sign up for e-newsletters go to bnf.org/newsletter. To visit the e-newsletter archive, go to bnf.org/bnf/extras/current/450066.htm
- BNF Update, an e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. Separate modules for primary and secondary care can be found at www.cppe.ac.uk.

So many changes are made to each new edition of the BNF, that not all of them can be accommodated in the Insert and the Changes section. We encourage healthcare professionals to review regularly the prescribing information on drugs that they encounter frequently.

Nutrition

Appendix 7 (p. 903) includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

Wound dressings

A table on wound dressings in Appendix 8 (p. 935) allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix. In section (A8.2) advanced wound contact dressings have been classified in order of increasing absorancy.

Unlicensed medicines

The BNF includes unlicensed use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the ‘off-label’ use of a licensed medicine, this is shown in the appropriate place by ‘[unlicensed]’.

Prices in the BNF

Basic net prices are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital. Prices have generally been calculated from the net cost used in pricing NHS prescriptions in October 2010. Prices generally reflect whole dispensing packs; prices for injections are stated per ampoule, vial, or syringe. The price for an extemporaneously prepared preparation has been omitted where the net cost of the ingredients used to make it would give a misleadingly low impression of the final price. In Appendix 8 prices stated are per dressing or bandage.

BNF prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-
the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales, Scotland, and Northern Ireland; prices in the different tariffs may vary.

Extra resources on the BNF website
While the BNF website (bnf.org) hosts the digital content of the BNF proper, it also provides additional resources such as Frequently Asked Questions and online calculators.

BNF prescribing practice for medical students
This online revision aid, produced in collaboration with Onexamination, provides clinical case studies to help medical students improve their knowledge of safe and effective prescribing while using the BNF. Further details about this module can be found at bnf.org/bnf/extra/current/450048.htm

Using other sources for medicines information
The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services (see inside front cover).
Changes for this edition

Significant changes

The BNF is revised twice yearly and numerous changes are made between issues. All copies of BNF No. 60 (September 2010) should therefore be withdrawn and replaced by BNF No. 61 (March 2011). Significant changes have been made in the following sections for BNF No. 61:

- Bowel cleansing preparations, section 1.6.5
- Atrial fibrillation and atrial arrhythmia, section 2.3.1
- Dronedarone [NICE guidance], section 2.3.2
- Hypertension in pregnancy, section 2.5
- Hypertensive crises [title ‘Accelerated or very severe hypertension’ amended to ‘Hypertensive crises’ and advice updated], section 2.5
- Sitaxentan (Thelin) [to be withdrawn from the market due to hepatotoxicity], section 2.5.1
- Heart failure, section 2.5.5
- Management of stroke [new prescribing notes on the management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage], section 2.9
- Clopidogrel and modified-release dipyridamole [NICE guidance], section 2.9
- Familial hypercholesterolaemia, section 2.12
- Formoterol dose in children [MHRA/CHM advice], section 3.1.1.1
- Fentanyl [counselling for the use of patches], section 4.7.2
- Epilepsy in pregnancy, section 4.8.1
- Alcohol dependence, section 4.10.1
- Nicotine dependence, section 4.10.2
- Opioid dependence, section 4.10.3
- Missed maintenance doses in opioid dependence, section 4.10.3
- Summary of antibacterial therapy [advice reformatted], section 5.1, Table 1
- Meningitis, section 5.1, Table 1
- Urinary-tract infections [culture and sensitivity testing], section 5.1.13
- Treatment of fungal infections: aspergillosis, section 5.2
- Treatment of fungal infections: invasive or disseminated candidiasis, section 5.2
- Indinavir [application of ‘less suitable for prescribing’ symbol], section 5.3.1
- Saquinavir [changes to cautions and contra-indications], section 5.3.1
- Peginterferon alfa, interferon alfa, and ribavirin for chronic hepatitis C [NICE guidance], section 5.3.3
- Palivizumab [updated advice], section 5.3.5
- Prophylaxis against malaria [recommendations for Morocco and Turkmenistan removed], section 5.4.1
- Rosiglitazone [marketing authorisation suspended], section 6.1.2.3
- Liraglutide for the treatment of type 2 diabetes mellitus [NICE guidance], section 6.1.2.3
- Diabetic ketoacidosis, section 6.1.3
- Treatment of hypoglycaemia, section 6.1.4
- Denosumab for the prevention of osteoporotic fractures in postmenopausal women [NICE guidance], section 6.6.2
- Recurrent vulvovaginal candidiasis [updated treatment regimens], section 7.2.2
- Combined hormonal contraceptive interactions, section 7.3.1
- Combined oral contraceptives [preparations tabulated], section 7.3.1
- Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours [NICE guidance], section 8.1.5
- Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours [NICE guidance], section 8.1.5
- Trastuzumab for the treatment of HER2-positive metastatic gastric cancer [NICE guidance], section 8.1.5
- Bevacizumab and sunitinib: risk of osteonecrosis of the jaw [MHRA/CHM advice], section 8.1.5
- Caution when dispensing mycophenolate mofetil [new brand available], section 8.2.1
- Rapamune® tablets [0.5 mg tablet not bioequivalent to other strengths], section 8.2.2
- Etorbropag for the treatment of chronic immune (idiopathic) thrombocytopenic purpura [NICE guidance], section 9.1.4
- G6FD deficiency [rasburicase and risk of haemolysis], section 9.1.5
- Calcium gluconate injection [MHRA advice], section 9.5.1
- Drugs unsafe for use in acute porphyrias, section 9.8.2
- Etanercept, infliximab, and adalimumab for psoriatic arthritis [NICE guidance], section 10.1.3
- Adalimumab, etanercept, infliximab, rituximab, and abatacept for rheumatoid arthritis after the failure of a TNF inhibitor [NICE guidance], section 10.1.3
- Tocilizumab for rheumatoid arthritis [NICE guidance], section 10.1.3
- Distigmine [removal of monograph for use in myasthenia gravis], section 10.2.1
- Aqueous cream [skin reactions when used as a leave-on emollient], section 13.2.1
- Immunisation schedule, section 14.1
- Haemophilus type B conjugate vaccine in complement deficiency, section 14.4
- Influenza vaccines, section 14.4
- Meningococcal vaccines in complement deficiency, section 14.4
- Adult advanced life support algorithm [Resuscitation Council (UK) updated algorithm 2010], inside back cover
Dose changes
Changes in dose statements introduced into BNF No. 61:
Aciclovir [herpes simplex treatment and suppression], p. 393
AmBisome®, p. 378
Atazanavir [paediatric dose], p. 386
Benzylpenicillin, p. 333
Bisacodyl, p. 69
Cefadroxil, p. 341
Cervarix®, p. 757
Cetirizine [dose in renal impairment], p. 192
Cetirizine [paediatric dose], p. 192
Co-amoxiclav [intravenous dose], p. 337
Cyproterone acetate [prevention of flare with initial gonadorelin analogue therapy], p. 573
Daptomycin [dose in renal impairment], p. 357
Ethosuximide [paediatric dose], p. 283
Famciclovir, p. 394
Fersamal®, p. 578
Fluoxetine [obsessive compulsive disorder], p. 241
Foradi® [dose for children under 12 years], p. 177
Fulvestrant, p. 570
Galantamine [dose in hepatic impairment], p. 318
Hyoscine butylbromide [by continuous infusion device for bowel colic and excessive respiratory secretions], p. 23
Hyoscine hydrobromide [by continuous infusion device for bowel colic and excessive respiratory secretions], p. 23
Ipratropium [dose frequency for severe acute asthma in adults], p. 171 and p. 173
Itraconazole [histoplasmosis], p. 375
Melatonin, p. 212
Methoxy polyethylene glycol-epoetin beta, p. 586
Metronidazole, p. 367
Methyldopa, p. 177
Phosphodiesterase type-3 inhibitors [title change]
Phosphodiesterase type-4 inhibitors [new sub-section]
Non-opioid analgesics and compound analgesic preparations [title change]
Alcohol dependence [new section]
Nicotine dependence [new section]
Opioid dependence [new section]
Opioid substitution therapy [new sub-section]
Adjunctive therapy and symptomatic treatment [new sub-section]
Opioid-receptor antagonists [new sub-section]
Drugs for the relief of soft-tissue inflammation and topical pain relief [title change]
Rubefacients, topical NSAIDs, capsaicin, and poultices [title change]
Anxiolytics [title change]
Hydrocortisone mucoadhesive buccal tablets [formerly Corlan®], p. 694
Laxido® Orange [formerly Laxido®], p. 71
Oiatum® Junior bath additive [formerly Oiatum® Junior emollient bath additive], p. 704
Actinac®
Andropatch®
Avandamet®
Avandia®
Baxan®
Clonidine injection
Dexedrine®
Digitoxin
Dimercaprol
Flixotide® Diskhaler
Imuderm®
Vagifem®, p. 491
Valaciclovir, p. 394
Xylometazoline [nasal spray], p. 692

Classification changes
Classification changes have been made in the following sections for BNF No. 61:
Section 2.1.2 Phosphodiesterase type-3 inhibitors [title change]
Section 3.3.3 Phosphodiesterase type-4 inhibitors [new sub-section]
Section 4.7.1 Non-opioid analgesics and compound analgesic preparations [title change]
Section 4.10.1 Alcohol dependence [new section]
Section 4.10.2 Nicotine dependence [new section]
Section 4.10.3 Opioid dependence [new section]
Section 4.10.3 Opioid substitution therapy [new sub-section]
Section 4.10.3 Adjunctive therapy and symptomatic treatment [new sub-section]
Section 4.10.3 Opioid-receptor antagonists [new sub-section]
Section 10.3 Drugs for the relief of soft-tissue inflammation and topical pain relief [title change]
Section 10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices [title change]
Section 15.1.4.1 Anxiolytics [title change]

New names
Name changes introduced into BNF No. 61:
Hydrocortisone mucoadhesive buccal tablets [formerly Corlan®], p. 694
Laxido® Orange [formerly Laxido®], p. 71
Oiatum® Junior bath additive [formerly Oiatum® Junior emollient bath additive], p. 704

Deleted preparations
Preparations listed below have been discontinued during the compilation of BNF No. 61, or are still available but are not considered suitable for inclusion by the Joint Formulary Committee (see footnote).
Actinac®
Andropatch®
Avandamet®
Avandia®
Baxan®
Clonidine injection
Dexedrine®
Digitoxin
Dimercaprol
Flixotide® Diskhaler
Imuderm®

1 Not considered suitable for inclusion by the Joint Formulary Committee
New preparations included in this edition

Preparations included in the relevant sections of BNF No. 61:

Adoport® [tacrolimus], p. 558
Aquamol®, p. 702
Arzip® [mycophenolate mofetil], p. 555
Bocouture® [botulinum toxin type A], p. 309
Calcichew-D® 500 mg/400 unit caplets [calcium carbonate with colecalciferol], p. 619
Capimune® [ciclosporin], p. 557
Catacrom® [sodium cromoglycate], p. 673
Clinis Gel® [carbomers], p. 680
Cyanokit® [hydroxocobalamin], p. 39
Dexa® [dexamethasone], p. 191
Dermatonics Heel Balm®, p. 703
Dovobet® gel [betametasone with calcipotriol], p. 717
Dovonex® ointment [calcipotriol], p. 717
Genotropin GoQuick® [somatropin], p. 465
Glusart® [glucosamine sulphate], p. 657
Gynoxin® [fenticonazole], p. 493
Humulin I KwikPen® [isophane insulin], p. 424
Humulin M3 KwikPen® [biphasic isophane insulin], p. 426
Hyabak® [sodium hyaluronate], p. 681
Hylo-Care® [sodium hyaluronate], p. 681
Insuman Comb 25 SoloStar® [biphasic isophane insulin], p. 426
Levact® [bendamustine], p. 524
Lodotra® [prednisone], p. 448
Lumecare® Long Lasting Tear Gel [carbomers], p. 680
Lumecare® Preservative Free Tear Drops [hypromellose], p. 680
Marol® [tramadol m/r], p. 272
Mipilet® [acetylcholine chloride], p. 682
Monofer® [iron isomaltoside 1000], p. 579
Moxivig® [moxifloxacin], p. 668
Neokay® [phytomenadione], p. 621
Nexplanor® [etoricoxib], p. 502
Nivestim® [filgrastim], p. 592
NuTRIflex® Omega plus, p. 605
NuTRIflex® Omega special, p. 605
Onbrez Breezhaler® [indacaterol], p. 177
Ozurdex® [dexamethasone], p. 671
PecFent® [pentanyl], p. 266
Rebif® (Rebif®) injection [interferon beta-1a], p. 562
Renvela® [sevelamer carbonate], p. 613
Sativex® [Cannabis sativa extract], p. 661
Simpont® [golimumab], p. 653
Tears Naturale® Single Dose [hypromellose], p. 680
Tevagranstim® [filgrastim], p. 593
Tobramycin® [tobramycin], p. 669
Tructial® , p. 607
Vimovo® [naproxen with esomeprazole], p. 639
Votrient® [pazopanib], p. 548
VPRI® [velaglucerase alfa], p. 624
Zutectra® [hepatitis B-specific immunoglobulin], p. 771
Taking medicines to best effect  

Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse effects;
- patients’ perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (‘concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient’s acceptance of medicines.

Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician’s instructions by the pharmacist and other members of the healthcare team also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

Biosimilar medicines  

A biosimilar medicine is a new biological product that is similar to a medicine that has already been authorised to be marketed (the biological reference medicine) in the European Union. The active substance of a biosimilar medicine is similar, but not identical, to the biological reference medicine. Biological products are different from standard chemical products in terms of their complexity and although theoretically there should be no important differences between the biosimilar and the biological reference medicine in terms of safety or efficacy, when prescribing biological products, it is good practice to use the brand name. This will ensure that substitution of a biosimilar medicine does not occur when the medicine is dispensed.

Biosimilar medicines have black triangle status (/lists, see p. 12) at the time of initial marketing. It is important to report suspected adverse reactions to biosimilar medicines using the Yellow Card Scheme (p. 12). For biosimilar medicines, adverse reaction reports should clearly state the brand name of the suspected medicine.

Complementary and alternative medicine  

An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John’s wort—see Appendix 1). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles  

In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles  

Where non-proprietary (‘generic’) titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer’s version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations.

Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction.

Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Medicines Act (Section 65).

Proprietary titles  

Names followed by the symbol® are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.
2 General guidance

Marketing authorisation and BNF advice In general the doses, indications, cautions, contra-indications, and side-effects in the BNF reflect those in the manufacturers’ data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies, see p. 988.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. When the BNF suggests a use (or route) that is outside the licensed indication of a product (‘off-label’ use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

Excipients Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of aspartame, gluten, sulphites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations (section 13.1.3), in vaccines (section 14.1), and on selected preservatives and excipients in eye drops and injections.

The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal

1 These recommendations are acceptable for prescription-only medicines (POM). For items marked (R) see also Controlled Drugs and Drug Dependence, p. 8.
toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of propylene glycol in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g., in renal failure, in neonates and young children, and in slow metabolizers of the substance. It may interact with disulfiram and metronidazole.

The lactose content in most medicines is too small to cause problems in most lactose-intolerant patients. However, in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength. However, in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

Extemporaneous preparation A product should be dispensed extemporaneously only when no product with a marketing authorisation is available.

The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections, section 9.2.2).

Drugs and driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g., driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

Patents In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

Health and safety When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

Safety in the home Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a supplier for destruction.

Name of medicine The name of the medicine should appear on the label unless the prescriber indicates otherwise.

(a) The strength is also stated on the label in the case of tablets, capsules, and similar preparations that are available in different strengths.

(b) If it is the wish of the prescriber that a description such as ‘The Sedative Tablets’ should appear on the label, the prescriber should write the desired description on the prescription form.

(c) The arrangement will extend to approved names, proprietary names or titles given in the BP, BPC, BNF, DPF, or NPF.

(d) The name written on the label is that used by the prescriber on the prescription.

(e) When a prescription is written other than on an NHS prescription form the name of the prescribed preparation will be stated on the label of the dispensed medicine unless the prescriber indicates otherwise.

(f) The Council of the Royal Pharmaceutical Society advises that the labels of dispensed medicines should indicate the total quantity of the product dispensed in the container to which the label refers. This requirement applies equally to solid, liquid, internal, and external preparations. If a product is dispensed in more than one container, the reference should be to the amount in each container.

Non-proprietary names of compound preparations which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients. Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted. Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co-’ should be retained. Special care should also be taken to avoid creating generic names for modified-release preparations where the use of these names could lead to confusion between formulations with different lengths of action.
EEA and Swiss prescriptions. Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1 to 5 or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

Security and validity of prescriptions. The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:
- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD). In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales) and at www.nelm.nhs.uk/en/Communities/NeLM/PGDs.

NICE and Scottish Medicines Consortium. Advice issued by the National Institute for Health and Clinical Excellence (NICE) is included in the BNF when relevant. The BNF also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland. If advice within a NICE Single Technology Appraisal differs from SMC advice, the Scottish Executive expects NHS Boards within NHS Scotland to comply with the SMC advice. Details of the advice together with updates can be obtained from www.nice.org.uk and from www.scottishmedicines.org.uk.
Prescription writing

Shared care
In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Prescriptions should be written legibly in ink or otherwise so as to be indelible, should be dated, should state the name and address of the patient, and should be signed in ink by the prescriber. The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years.

The following should be noted:

(a) The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg.
Quantities of 1 gram or more should be written in milligrams, e.g. 500 mg, not 0.5 g.
Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg.
When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL.
Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.

(b) ‘Micrograms’ and ‘nanograms’ should not be abbreviated. Similarly ‘units’ should not be abbreviated.

(c) The term ‘millilitre’ (ml or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used.

(d) Dose and dose frequency should be stated; in the case of preparations to be taken as required a minimum dose interval should be specified.
When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, see p. 2 (except for preparations intended to be measured with a pipette).
Suitable quantities:

- Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
- Adult Mixtures (10-mL dose), 200 or 300 mL
- Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack)
- Eye Lotions, Gargles, and Mouthwashes, 200 mL

(e) For suitable quantities of dermatological preparations, see section 13.1.2.

(f) The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only (see also advice in box on p. 3 to avoid creating generic titles for modified-release preparations).

(g) The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated.
When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.

(h) Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used (for details see Inside Back Cover).

(i) Medical and dental practitioners may prescribe unlicensed medicines (i.e. those without marketing authorisation) or withdrawn medicines. The prescriber should inform the patient or the patient’s carer that the product does not have a marketing authorisation.

For a sample prescription, see below.
Prescribing by dental surgeons Until new prescribing arrangements are in place for NHS prescriptions, dental surgeons should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners’ Formulary. The Act and Regulations do not set any limitations upon the number and variety of substances which the dental surgeon may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dental surgeon may use or order whatever is required for the clinical situation. There is no statutory requirement for the dental surgeon to communicate with a patient’s medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient’s interest and such communication is to be encouraged. For legal requirements relating to prescriptions for Controlled Drugs, see p. 8.

Computer-issued prescriptions For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

1. The computer must print out the date, the patient’s surname, one forename, other initials, and address, and may also print out the patient’s title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.

2. The doctor’s name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor’s surgery address, reference number, and Primary Care Trust (PCT) are also necessary. In addition, the surgery telephone number should be printed.

3. When prescriptions are to be signed by general practitioner registrars, assistants, locums, or depu- tising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.

4. Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.

5. The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.

6. The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required, see (h) above.

7. The BNF recommendations should be followed as in (a), (b), (c), (d), and (e) above.

8. Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as ‘as directed’ and ‘when required’, the maximum daily dose should normally be specified.

9. Numbers and codes used in the system for organising and retrieving data must never appear on the form.

10. Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.

11. A mechanism (such as printing a series of non-specific characters) should be incorporated to cancel out unused space, or wording such as ‘no more items on this prescription’ may be added after the last item. Otherwise the doctor should delete the space manually.

12. To avoid forgery the computer may print on the form the number of items to be dispensed (some- where separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.

13. Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor’s own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol " (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).

14. Prescriptions for controlled drugs can be printed from the computer, but the prescriber’s signature must be handwritten.*

15. The strip of paper on the side of the FP10SS may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient’s name to appear at the top, but this should be preceded by ‘confiden- tial’.

16. In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.

17. Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.

---

1. Health Board in Scotland, Local Health Board in Wales.
2. See Controlled Drugs and Drug Dependence p. 8; the prescriber may use a date stamp.
3. GP10SS in Scotland, WP10SS in Wales.
Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Prescription Only Medicines (Human Use) Order 1997 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

(a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:

(i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
(ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
(iii) as to the dose that it would be appropriate for the person to take;

(b) that no greater quantity shall be supplied than will provide 5 days’ treatment of phenobarbital, phenobarbital sodium, or Controlled Drugs in Schedules 4 or 5, or 30 days’ treatment for other prescription-only medicines, except when the prescription-only medicine is:

(i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
(ii) an oral contraceptive when a full cycle may be supplied;
(iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;

(c) that an entry shall be made by the pharmacist in the prescription book stating:

(i) the date of supply;
(ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
(iii) the name and address of the patient;
(iv) the nature of the emergency;

(d) that the container or package must be labelled to show:

(i) the date of supply;
(ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
(iii) the name of the patient;
(iv) the name and address of the pharmacy;
(v) the words ‘Emergency supply’;
(vi) the words ‘Keep out of the reach of children’ (or similar warning);

(e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy; for details see Medicines, Ethics and Practice, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available).

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

(a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
(b) that the prescriber has undertaken to furnish a prescription within 72 hours;
(c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;
(d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy; for details see Medicines, Ethics and Practice, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available);

(e) that an entry shall be made in the prescription book stating:

(i) the date of supply;
(ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
(iii) the name and address of the practitioner requesting the emergency supply;
(iv) the name and address of the patient;
(v) the date on the prescription;
(vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society’s guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, No. 34, London Pharmaceutical Press, 2010 (and subsequent editions).

1. Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs, or drugs that do not have a UK marketing authorisation.
Controlled Drugs and drug dependence

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to ‘Controlled Drugs’, in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the harmfulness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

**Class A** includes: afillin, cocaine, diamorphine (heroin), dipipanone, lysergide (LSD), methadone, methylatedxoxymethamphetamine (MDMA), ‘ecstasy’), morphine, opium, pethidine, phenacyldine, remifentanil, and class B substances when prepared for injection

**Class B** includes: oral amphetamines, barbiturates, cannabis, cannabis resin, codeine, ethylmorphine, glutethimide, nabilone, pentazocine, phenmetrazine, and pholcodine

**Class C** includes: certain drugs related to the amphetamines such as benzphetamine and chlorphentermine, buprenorphine, diethylpropion, mazindol, meprobamate, pemoline, pipradrol, most benzodiazepines, zolpidem, and androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin

The Misuse of Drugs Regulations 2001 define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

**Schedule 1** includes drugs such as cannabis and lysergide which are not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.

**Schedule 2** includes drugs such as diamorphine (heroin), morphine, nabilone, remifentanil, pethidine, secobarbital, glutethimide, amfetamine, and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for secobarbital), the need to keep registers, etc. (unless exempted in Schedule 5).

**Schedule 3** includes the barbiturates (except seco- barbital, now Schedule 2), buprenorphine, diethylpropion, mazindol, meprobamate, midazolam, pentazocine, phentermine, and temazepam. They are subject to the special prescription requirements (except for temazepam) and to the safe custody requirements (except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), mazindol, meprobamate, midazolam, pentazocine, phentermine, or any stereoisomeric form or salts of the above).

Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).

**Schedule 4** includes in Part I benzodiazepines (except temazepam and midazolam, which are in Schedule 3) and zolpidem, which are subject to minimal control. Part II includes androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

**Schedule 5** includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

**Prescriptions** Preparations in Schedules 2 and 3 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF by the symbol [C] (Controlled Drug). The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance, p. 9).

**Prescription requirements** Prescriptions for Controlled Drugs that are subject to prescription requirements must be indelible, and must be signed by the prescriber, be dated, and specify the prescriber’s address. The prescription must always state:

- the name and address of the patient;
- in the case of a preparation, the form and where appropriate the strength of the preparation;
- either the total quantity (in both words and figures) of the preparation, or the number (in both words and figures) of dosage units, as appropriate, to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose;
- the words ‘for dental treatment only’ if issued by a dentist.

A pharmacist is not allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist. Failure to comply with the regulations concerning the writing of prescriptions will result in inconvenience to patients and delay in supplying the necessary medicine. A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon.7

1. All preparations in Schedules 2 and 3, except temazepam.
2. A machine-written prescription is acceptable. The prescriber’s signature must be handwritten.
3. The dosage form (e.g. tablets) must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name (e.g. MST ‘Continus’) or whether only one form is available.
4. When more than one strength of a preparation exists the strength required must be specified.
5. The Home Office has advised that quantities of liquid preparations, such as methadone oral solution, should be written in millilitres.
6. The instruction ‘one as directed’ constitutes a dose but ‘as directed’ does not.
7. The prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription.
Instalments and ‘repeats’ A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified.1

Instalment prescriptions must be dispensed in accordance with the directions in the prescription. However, the Home Office has approved specific wording which may be included in an instalment prescription, to cover certain situations; for example, if a pharmacy is closed on the day when an instalment is due. For details, see Medicines, Ethics and Practice, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available) or see Drug Misuse and Dependence: UK Guidelines on Clinical Management (2007), available at www.nta.nhs.uk/uploads/clinical_guidelines_2007.pdf.

Prescriptions ordering ‘repeats’ on the same form are not permitted for Controlled Drugs in Schedules 2 or 3.

Private prescriptions Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the prescriber’s identification number. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

1 A total of 14 days’ treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, bupropion, and diazepam may be prescribed in England. In England, forms FP10(MDA) (blue) and FP10H(MDA) (blue) should be used. In Scotland, forms GP10 (peach), HPB (blue), or HBPA (pink) should be used. In Wales a total of 14 days’ treatment by instalment of any drug listed in Schedules 2–5 of the Misuse of Drugs Regulations may be prescribed. In Wales, form WP10(MDA) or form WP10HP(AD) should be used.

Department of Health guidance Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- in general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days’ treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient’s notes;
- the patient’s identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.

Further information is available at www.dh.gov.uk. For a sample prescription, see above.

Dependence and misuse The most serious drugs of addiction are cocaine, diamorphine (heroin), morphine, and the synthetic opioids. For arrangements for prescribing of diamorphine, dipipanone, or cocaine for addicts, see p. 11.

Despite marked reduction in the prescribing of amphetamines, there is concern that abuse of illicit amphetamine and related compounds is widespread.

Benzodiazepines are commonly misused. However, the misuse of barbiturates is now uncommon, in line with declining medicinal use and consequent availability.

Cannabis (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. Lysergide (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening.

There are concerns over increases in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine and gamma-hydroxybutyrate (sodium oxybate, GHB).

Supervised consumption Individuals prescribed opioid substitution therapy (section 4.10.3) can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment.

Prescribing drugs likely to cause dependence or misuse The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more
likely. This tendency is seen especially with hypnotics and anxiolytics (for CSM advice see section 4.1). The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.

- To avoid being used as an unwitting source of supply for addicts. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.

The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- write the quantity in words and figures when prescribing drugs prone to abuse; this is obligatory for prescribed in the first instance, or when seeing a new patient for the first time.

Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country’s consulate in the UK.

### Notification of drug misusers

Doctors should report cases of drug misuse to their regional or national drug misuse database or centre—see below for contact telephone numbers. The National Drugs Treatment Monitoring System (NDTMS) was introduced in England in April 2001; regional (NDTMS) centres replace the Regional Drug Misuse Databases. A similar system has been introduced in Wales.

Notification to regional (NDTMS) or national centre should be made when a patient starts treatment for drug misuse. All types of problem drug misuse should be reported including opioid, benzodiazepine, and CNS stimulant.

The regional (NDTMS) or national centres are now the only national and local source of epidemiological data on people presenting with problem drug misuse; they provide valuable information to those working with drug misusers and those planning services for them. The databases cannot, however be used as a check on misusers and those planning services for them. The regional (NDTMS) centres replace the Regional Drug Misuse Databases. A similar system has been introduced in Wales.

Enquiries about the regional (NDTMS) or national centres (including information on how to submit data) can be made to one of the centres listed below:

**Travelling abroad**

Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.homeoffice.gov.uk/drugs/licensing/personal, or from the Home Office by contacting licensing_enquiry.aadu@homeoffice.gsi.gov.uk (in cases of emergency, telephone (020) 7035 0484).

Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient’s name and address;
- the quantities of drugs to be carried;
- the strength and form in which the drugs will be dispensed;
- the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing, Peel Building, 2 Marsham Street, London, SW1P 4DF. Alternatively, completed application forms can be emailed to licensing_enquiry.aadu@homeoffice.gsi.gov.uk with a scanned copy of the covering letter from the prescriber. A minimum of two weeks should be allowed for processing the application.
In **Northern Ireland**, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

**Medical contact:**
Dr Ian McMaster  
C3 Castle Buildings  
Belfast, BT4 3FQ  
Tel: (028) 9052 2421  
Fax: (028) 9052 0718  
ian.mcmaster@dhsspsni.gov.uk

**Administrative contact:**
Public Health Information & Research Branch  
Annex 2  
Castle Building  
Belfast, BT4 3SQ  
Tel: (028) 9052 2520

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement.

---

**Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts**

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that only medical practitioners who hold a special licence issued by the Home Secretary may prescribe, administer, or supply diamorphine, dipipanone (Diconal®), or cocaine in the treatment of drug addiction; other practitioners must refer any addict who requires these drugs to a treatment centre. Whenever possible the addict will be introduced by a member of staff from the treatment centre to a pharmacist whose agreement has been obtained and whose pharmacy is conveniently sited for the patient. Prescriptions for weekly supplies will be sent to the pharmacy by post and will be dispensed on a daily basis as indicated by the doctor. If any alterations of the arrangements are requested by the addict, the portion of the prescription affected must be represcribed and not merely altered.

General practitioners and other doctors do not require a special licence for prescribing diamorphine, dipipanone,
Adverse reactions to drugs

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners (see also Self-reporting below) are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.yellowcard.gov.uk. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in this book (inside back cover).

Send Yellow Cards to:
FREEPOST YELLOW CARD
(No other address details required)
Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products.

A 24-hour Freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres can be contacted for further information:

Yellow Card Centre
Northwest
Freepost SW2991
70 Pembroke Place
Liverpool L69 3GF
Tel: (0151) 794 8122

Yellow Card Centre
Northern & Yorkshire
Freepost SW2991
Wolfson Unit
Claremont Place
Newcastle upon Tyne NE2 4HH

Yellow Card Centre Scotland
Freepost NAT3271
CARDS, Royal Infirmary of Edinburgh
Edinburgh EH16 4SA
Tel: (0131) 242 2919

The MHRA’s database facilitates the monitoring of adverse drug reactions.

More detailed information on reporting and a list of products currently under intensive monitoring can be found on the MHRA website: www.mhra.gov.uk.

Self-reporting

Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.yellowcard.gov.uk, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.yellowcard.gov.uk.

Prescription-event monitoring

In addition to the MHRA’s Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.dsrpu.org.

Newer drugs and vaccines

Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice.

The black triangle symbol (▼) identifies newly licensed medicines that are monitored intensively by the MHRA. Such medicines include new active substances, biosimilar medicines, medicines that have been licensed for administration by a new route or drug delivery system, or for significant new indications which may alter the established risks and benefits of that drug, or that contain a new combination of active substances. There is no standard time for which products retain a black triangle; safety data are usually reviewed after 2 years.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that all suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time.

Established drugs and vaccines

Healthcare professionals and coroners are asked to report all serious suspected reactions to established drugs (including over-the-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines. Serious reactions include those that are fatal, life-threatening, disabling, incapacitating, or which result in or prolong hospitalisation; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.
For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

Adverse reactions to medical devices Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers’ literature may be omitted from the BNF.

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is not generally listed, unless the drug carries an increased risk of such reactions. The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness.

In the product literature the frequency of side-effects is generally described as follows:

- Very common: greater than 1 in 10
- Common: 1 in 100 to 1 in 10
- Uncommon ['less commonly' in BNF]: 1 in 1000 to 1 in 100
- Rare: 1 in 10 000 to 1 in 1000
- Very rare: less than 1 in 10 000

Special problems

Delayed drug effects Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

The elderly Particular vigilance is required to identify adverse reactions in the elderly.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

Children Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; all suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children, p. 15).

Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions;
- ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, notably of isoniazid and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- warn the patient if serious adverse reactions are liable to occur.

Oral side-effects of drugs

Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient’s medical practitioner may be necessary.

Oral mucosa

Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind. Aspirin tablets allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration. Flavouring agents, particularly essential oils, may sensitise the skin, but mucosal swelling is not usually prominent.

The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate. Other drugs capable of causing oral ulceration include captopril (and other ACE inhibitors), gold, nicorandil, NSAI Ds, pancreatin, penicillamine, proguanil, and protease inhibitors.

Erythema multiforme or Stevens-Johnson syndrome may follow the use of a wide range of drugs including antibacterials, antiretrovirals, sulfonamide derivatives, and anticonvulsants; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs.

Lichenoid eruptions are associated with ACE inhibitors, NSAIDs, methyldopa, chloroquine, oral antidiabetics, thiazide diuretics, and gold.

Candidiasis can complicate treatment with antibacterials and immunosuppressants and is an occasional side-effect of corticosteroid inhalers, see also p. 185.
Adverse reactions to drugs

Teeth and jaw

Brown staining of the teeth frequently follows the use of chlorhexidine mouthwash, spray or gel, and can readily be removed by polishing. Iron salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav suspension.

Intrinsic staining of the teeth is most commonly caused by tetracyclines. They will affect the teeth if given at any time from about the fourth month in utero until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey.

Excessive ingestion of fluoride leads to dental fluorosis with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child’s age (taking into account the fluoride content of the local drinking water and of toothpaste).

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease. All patients receiving bisphosphonates for cancer should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment. However, urgent bisphosphonate treatment should not be delayed, and a dental check-up should be carried out as soon as possible in these patients. All other patients who are prescribed bisphosphonates should have a dental examination only if they have poor dental health, see also MHRA/CHM advice (Bisphosphonates: osteonecrosis of the jaw), p. 537.

Gingival overgrowth (gingival hyperplasia) is a side-effect of phenytoin and sometimes of ciclosporin or of nifedipine (and some other calcium-channel blockers).

Thrombocytopenia may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

Salivary glands

The most common effect that drugs have on the salivary glands is to reduce flow (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene; they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly antimuscarinics (anticholinergics), antidepressants (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), alpha-blockers, antihistamines, antipsychotics, bactefen, bupropion, clonidine, 5HT, agonists, opioids, and tizanidine. Excessive use of diuretics can also result in xerostomia.

Some drugs (e.g. clozapine, neostigmine) can increase saliva production but this is rarely a problem unless the patient has associated difficulty in swallowing.

Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should not be confused with an Adverse Drug Reaction where the product conforms to its specification. The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and coordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre

info@mhra.gsi.gov.uk
Prescribing for children

For detailed advice on medicines used for children, consult BNF for Children

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.

Whenever possible, intramuscular injections should be avoided in children because they are painful.

Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use.

Although medicines cannot be promoted outside the limits of the licence, the Medicines Act does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications ('off-label' use) is often necessary in paediatric practice.

Adverse drug reactions in children

The reporting of all suspected adverse drug reactions, no matter how minor, in children under 18 years is strongly encouraged through the Yellow Card Scheme (see p. 12) even if the intensive monitoring symbol (◇) has been removed. This is because experience in children may still be limited.

The identification and reporting of adverse reactions to drugs in children is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs are not extensively tested in children;
- many drugs are not specifically licensed for use in children and are used 'off-label';
- suitable formulations may not be available to allow precise dosing in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Dose calculation

Many children’s doses are standardised by weight (and therefore require multiplying by the body-weight in kilograms to determine the child’s dose); occasionally, the doses have been standardised by body surface area (in m²). These methods should be used rather than attempting to calculate a child’s dose on the basis of doses used in adults.

For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, dose should be calculated from

Rare paediatric conditions

Information on substances such as biotin and sodium benzoate used in rare metabolic conditions is included in BNF for Children; further information can be obtained from:

Alder Hey Children’s Hospital
Drug Information Centre
Liverpool L12 2AP
Tel: (0151) 252 5381

Great Ormond Street Hospital for Children
Pharmacy
Great Ormond St
London WC1N 3JH
Tel: (020) 7405 9200

Dosage in children

Children’s doses in the BNF are stated in the individual drug entries as far as possible, except where paediatric use is not recommended, information is not available, or there are special hazards.

Doses are generally based on body-weight (in kilograms) or the following age ranges:

- first month (neonate) up to 1 year (infant)
- 1–5 years
- 6–12 years

Unless the age is specified, the term ‘child’ in the BNF includes persons aged 12 years and younger.

Parents should be advised not to add any medicines to the infant’s feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep all medicines out of reach of children, see Safety in the Home, p. 3.

Prescription writing

Prescriptions should be written according to the guidelines in Prescription Writing (p. 5)

Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for all prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an oral syringe will be supplied (for details, see p. 2).
an ideal weight, related to height and age (see inside back cover).

**Body surface area (BSA) estimates** are sometimes preferable to body-weight for calculation of paediatric doses since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to *BNF for Children*.

Where the dose for children is not stated, prescribers should consult *BNF for Children* or seek advice from a medicines information centre.

**Dose frequency** Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child’s bedtime.

Where new or potentially toxic drugs are used, the manufacturers’ recommended doses should be carefully followed.
Prescribing in hepatic impairment

Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

**Impaired drug metabolism** Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired.

A few drugs, e.g. rifampicin and fusidic acid, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

**Hypoproteinaemia** The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin and prednisolone.

**Reduced clotting** Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the sensitivity to oral anticoagulants such as warfarin and phenindione.

**Hepatic encephalopathy** In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

**Fluid overload** Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention, e.g. NSAIDs and corticosteroids.

**Hepatotoxic drugs** Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

---

Prescribing in renal impairment

The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

**Principles of dose adjustment in renal impairment**

The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity.

For many drugs with only minor or no dose-related side-effects very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient.

For more toxic drugs with a small safety margin or patients at extremes of weight, dose regimens based on creatinine clearance (see below for details) should be used. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration.

Renal function declines with age; many elderly patients have renal impairment but, because of reduced muscle mass, this may not be indicated by a raised serum creatinine. It is wise to assume at least mild impairment of renal function when prescribing for the elderly.

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same size as the initial dose for a patient with normal renal function.

**Nephrotoxic drugs** should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced.

Dose recommendations are based on the severity of renal impairment.
Renal function is measured either in terms of estimated glomerular filtration rate (eGFR) calculated from a formula derived from the Modification of Diet in Renal Disease study (‘MDRD formula’ that uses serum creatinine, age, sex, and race (for Afro-Caribbean patients)) or it can be expressed as creatinine clearance (best derived from a 24-hour urine collection but often calculated from the Cockcroft and Gault formula (CG)).

Cockcroft and Gault formula

\[
\text{Estimated Creatinine Clearance in mL/minute} = \frac{(140 - \text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum creatinine}}
\]

- Age in years
- Weight in kilograms; use ideal body-weight
- Serum creatinine in micromol/litre
- Constant = 1.23 for men; 1.04 for women

The serum-creatinine concentration is sometimes used instead as a measure of renal function but it is only a rough guide to drug dosing.

Important

Renal function in adults is increasingly being reported on the basis of estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m² and derived from the Modification of Diet in Renal Disease (MDRD) formula. However, published information on the effects of renal impairment on drug elimination is usually stated in terms of creatinine clearance as a surrogate for glomerular filtration rate (GFR).

The information on dosage adjustment in the BNF is expressed in terms of eGFR, rather than creatinine clearance, for most drugs (see exceptions below: Toxic Drugs and Patients at Extremes of Weight). Although the two measures of renal function are not interchangeable, in practice, for most drugs and for most patients (over 18 years) of average build and height, eGFR (MDRD ‘formula’) can be used to determine dosage adjustments in place of creatinine clearance. An individual’s absolute glomerular filtration rate can be calculated from the eGFR as follows:

\[
\text{GFR Absolute} = \frac{\text{eGFR}}{\text{Body surface area}/1.73}
\]

Toxic drugs

For potentially toxic drugs with a small safety margin, creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages in addition to plasma-drug concentration and clinical response.

Patients at extremes of weight

In patients at both extremes of weight (BMI of less than 18.5 kg/m² or greater than 30 kg/m²) the absolute glomerular filtration rate or creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages.

In the BNF, values for eGFR, creatinine clearance (for toxic drugs), or another measure of renal function are included where possible. However, where such values are not available, the BNF reflects the terms used in the published information.

Chronic kidney disease in adults: UK guidelines for identification, management and referral (March 2006) define renal function as follows:

<table>
<thead>
<tr>
<th>Degree of impairment</th>
<th>eGFR mL/minute/1.73 m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal - Stage 1</td>
<td>More than 90 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Mild - Stage 2</td>

1. NICE clinical guideline 73 (September 2008)—Chronic kidney disease: Stage 3A eGFR 45–59, Stage 3B eGFR 30–44

Dialysis

For prescribing in patients on continuous ambulatory peritoneal dialysis (CAPD) or haemodialysis, consult specialist literature.

Drug prescribing should be kept to the minimum in all patients with severe renal disease. If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification.

Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.
Prescribing in pregnancy

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy.

During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery.

Not all the damaging effects of intrauterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The BNF identifies drugs which:
1. may have harmful effects in pregnancy and indicates the trimester of risk
2. are not known to be harmful in pregnancy

The information is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Prescribing in breast-feeding

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

1. the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
2. the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
3. the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction.

A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity.

Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital) while others can affect lactation (e.g. bromocriptine).

The BNF identifies drugs:
1. that should be used with caution or are contraindicated in breast-feeding;
2. that can be given to the mother during breast-feeding because they are present in milk in amounts which are too small to be harmful to the infant;
3. that might be present in milk in significant amount but are not known to be harmful.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.
Prescribing in palliative care

Palliative care is the active total care of patients whose disease is not responsive to curative treatment. Control of pain, of other symptoms, and of psychological, social and spiritual problems, is paramount to provide the best quality of life for patients and their families. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team.

Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish.

Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment

The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain

Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol (p. 259) or a NSAID (section 10.1.1) given regularly will often make the use of opioid analgesics unnecessary. A NSAID may also control the pain of bone secondaries; if necessary, flurbiprofen or indometacin can be given rectally. Radiotherapy, bisphosphonates (section 6.6.2), and radioactive isotopes of strontium (Metastron®, available from GE Healthcare) may also be useful for pain due to bone metastases.

An opioid analgesic (section 4.7.2) such as codeine (p. 264), alone or in combination with a non-opioid analgesic at adequate dosage, may be helpful in the control of moderate pain if non-opioid analgesics alone are not sufficient. Alternatively, tramadol (p. 271) can be considered for moderate pain. If these preparations do not control the pain, morphine (p. 268) is the most useful opioid analgesic. Alternatives to morphine, including hydromorphone (p. 267), methadone (p. 267), oxycodone (p. 269), and transdermal fentanyl (see below and p. 265) are best initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Equivalent single doses of opioid analgesics

These equivalences are intended only as an approximate guide; patients should be carefully monitored after any change in medication and dose titration may be required.

<td>5 mg</td>
</tr>
</tbody>
</table>

Oral route

Morphine (p. 268) is given by mouth as an oral solution or as standard (‘immediate release’) tablets regularly every 4 hours, the initial dose depending largely on the patient’s previous treatment. A dose of 5–10 mg is enough to replace a weaker analgesic (such as paracetamol), but 10–20 mg or more is required to replace a strong one (comparable to morphine itself). If the first dose of morphine is no more effective than the previous analgesic, the next dose should be increased by 30–50%, the aim being to choose the lowest dose that prevents pain. The dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics (such as NSAIDs) should also be considered.

Although morphine in a dose of 5–20 mg is usually adequate there should be no hesitation in increasing it stepwise according to response to 100 mg or occasionally up to 500 mg or higher if necessary. It may be possible to omit the overnight dose if double the usual dose is given at bedtime.

When the pain is controlled and the patient’s 24-hour morphine requirement is established, the daily dose can be given as a modified-release preparation in a single dose or in two divided doses.

Preparations suitable for twice-daily administration include Morphgesic® tablets or suspension (p. 268), MST Continus® tablets or suspension (p. 269), and Zomorph® capsules (p. 269). MXL® capsules (p. 269) allow administration of the total daily morphine requirement as a single dose.

The starting dose of modified-release morphine preparations designed for twice daily administration is usually 10–20 mg every 12 hours if no other analgesic (or only paracetamol) has been taken previously, but to replace a weaker opioid analgesic (such as co-codamol) the starting dose is usually 20–30 mg every 12 hours. Increments should be made to the dose, not to the frequency of administration, which should remain at every 12 hours.

The effective dose of modified-release preparations can alternatively be determined by giving the oral solution of morphine every 4 hours in increasing doses until the pain has been controlled, and then transferring the patient to the same total 24-hour dose of morphine given as the modified-release preparation (divided into two portions for 12-hourly administration). The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the oral solution. The patient should be monitored closely for treatment efficacy and side-effects.

If pain occurs between regular doses of morphine (‘breakthrough pain’), an additional dose (‘rescue dose’) should be given. An additional dose should also
be given 30 minutes before an activity that causes pain (e.g. wound dressing). Morphine, as oral solution or standard formulation tablets, should be prescribed for breakthrough pain. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24 hour total daily dose, repeated every 4 hours if necessary (review pain management if analgesic required more frequently). Each patient should be assessed on an individual basis. Fentanyl lozenges are also licensed for breakthrough pain.

**Oxycodone** (p. 269) can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone should be started at a dose equivalent to the current analgesic (see Equivalent Single Doses of Opioid Analgesics table, p. 20).

**Levomepromazine** (p. 220) is licensed to treat pain in palliative care, and may be of benefit in some patients. It should be reserved for use in conjunction with strong opioid analgesics in distressed patients with severe pain unresponsive to other measures.

**Parenteral route** If the patient becomes unable to swallow, the equivalent intramuscular dose of morphine is half the oral solution dose; in the case of the modified-release tablets it is half the total 24-hour dose (which is then divided into 6 portions to be given every 4 hours). **Diamorphine** (p. 264) is preferred for injection because, being more soluble, it can be given in a smaller volume. The equivalent intramuscular (or subcutaneous) dose is approximately a third of the oral dose of morphine. **Subcutaneous infusion of diamorphine via continuous infusion device** can be useful (for details, see p. 23). If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of diamorphine. See table of approximate equivalent doses of morphine and diamorphine, p. 24.

**Rectal route** Morphine (p. 269) is also available for rectal administration as suppositories; alternatively oxycodone (p. 269) suppositories can be obtained on special order.

**Transdermal route** Transdermal preparations of fentanyl and buprenorphine are available (section 4.7.2); they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations (see under Fentanyl, p. 265) because inappropriate use has caused fatalities. The following 24-hour doses of morphine by mouth are considered to be approximately equivalent to the fentanyl patches shown:

<table>
<thead>

<tr>
<td>Morphine salt 360 mg daily</td>
<td>fentanyl '100' patch</td>
</tr>
</tbody>
</table>

Morphine (as oral solution or standard formulation tablets) is given for breakthrough pain.

**Gastro-intestinal pain** The pain of bowel colic may be reduced by loperamide 2–4 mg 4 times daily. Hyoscine hydrobromide (section 4.6) may also be helpful, given sublingually at a dose of 300 micrograms 3 times daily as Kwells® tablets. For the dose by subcutaneous infusion, see p. 23.

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent (section 1.1.1) and a prokinetic such as domperidone 10 mg 3 times daily before meals.

**Muscle spasm** The pain of muscle spasm can be helped by a muscle relaxant such as diazepam 5–10 mg daily or baci lene 5–10 mg 3 times daily.

**Neuropathic pain** Patients with neuropathic pain (section 4.7.3) may benefit from a trial of a tricyclic antidepressant for several weeks. An anticonvulsant may be added or substituted if pain persists; gabapentin and pregabalin (both section 4.8.1) are licensed for neuropathic pain. Ketamine is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics.

Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone 6 mg daily, which reduces oedema around the tumour, thus reducing compression.

**Nerve blocks** can be considered when pain is localised to a specific area. **Transcutaneous electrical nerve stimulation** (TENS) may also help.

### Miscellaneous conditions

**Anorexia** Anorexia may be helped by prednisolone 15–30 mg daily or dexamethasone 2–4 mg daily.

**Bowel colic and excessive respiratory secretions** Bowel colic and excessive respiratory secretions may be reduced by a subcutaneous injection of hyoscine hydrobromide 400 micrograms, hyoscine butylbromide 20 mg, or glycopyrronium 200 micrograms. These antimuscarinics are generally given every 4 hours when required, but hourly use is occasionally necessary, particularly in excessive respiratory secretions. If symptoms persist, they can be given regularly via a continuous infusion device, see p. 23. Care is required to avoid the discomfort of dry mouth.

**Capillary bleeding** Capillary bleeding can be treated with tranexamic acid (section 2.11) by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL or adrenaline (epinephrine) solution 1 mg/mL (1 in 1000) can be applied to the affected area. Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K should be considered (section 9.6.6).
Constipation
Constipation is a very common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer) or lactulose solution with a senna preparation should be used (section 1.6.2 and section 1.6.3). Methylnaltrexone (section 1.6.6) is licensed for the treatment of opioid-induced constipation.

Convulsions
Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin or carbamazepine (section 4.8.1) should be considered. When oral medication is no longer possible, diazepam as suppositories 10–20 mg every 4 to 8 hours, or phenobarbital by injection 50–200 mg twice daily is continued as prophylaxis. For the use of midazolam by subcutaneous infusion using a continuous infusion device, see below.

Dry mouth
Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva (section 12.3.5); dry mouth associated with candidiasis can be treated by oral preparations of nystatin or micronazole (section 12.3.2); alternatively, fluconazole can be given by mouth (section 5.2.1). Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

Dysphagia
A corticosteroid such as dexamethasone 8 mg daily may help, temporarily, if there is an obstruction due to tumour. See also Dry Mouth, above.

Dyspnoea
Breathlessness at rest may be relieved by regular oral morphine in carefully titrated doses, starting at 5 mg every 4 hours. Diazepam 5–10 mg daily may be helpful for dryness associated with anxiety. A corticosteroid, such as dexamethasone 4–8 mg daily, may also be helpful if there is bronchospasim or partial obstruction.

Fungating tumours
Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole (section 5.1.1) is often required to reduce malodour but topical metronidazole can be given by mouth (section 5.2.1). Dry mouth may be alleviated by antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

Hiccup
Hiccup due to gastric distension may be helped by moist inhalations or by regular administration of oral morphine in an initial dose of 5 mg every 4 hours. Methadone linctus should be avoided because it has a long duration of action and tends to accumulate.

Nausea and vomiting
Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic (section 4.6) is started.

Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol or metoclopramide. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide has a prokinetic action and is used in a dose of 10 mg 3 times daily by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently.

Haloperidol is used by mouth in an initial dose of 1.5 mg once or twice daily (can be increased if necessary to 5–10 mg daily in divided doses) for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine is given in a dose of 50 mg up to 3 times daily by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

Levomepromazine can be used if first-line antiemetics are inadequate; it is given by mouth in a dose of 6–50 mg daily (6-mg tablets available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) in 1–2 divided doses. For the dose by subcutaneous infusion, see p. 23. Dexamethasone 8–16 mg daily by mouth can be used as an adjunct.

For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below.

For the treatment of nausea and vomiting associated with cancer chemotherapy, see section 8.1.

Pruritus
Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients (section 13.2.1). In the case of obstructive jaundice, further measures include administration of cholestyramine (section 1.9.2).

Raised intracranial pressure
Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone 16 mg daily for 4 to 5 days, subsequently reduced to 4–6 mg daily if possible; dexamethasone should be given before 6 p.m. to reduce the risk of insomnia.

Restlessness and confusion
Restlessness and confusion may require treatment with haloperidol 1–3 mg by mouth every 8 hours. Levomepromazine is also used occasionally for restlessness. For the dose by subcutaneous infusion using a continuous infusion device, see p. 23.
Continuous infusion devices

Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Syringe driver rate settings

Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.

Indications for the parenteral route are:

1. the patient is unable to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma;
2. there is malignant bowel obstruction in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube);
3. occasionally when the patient does not wish to take regular medication by mouth.

Bowel colic and excessive respiratory secretions

Hyoscine hydrobromide effectively reduces respiratory secretions and is sedative (but occasionally causes paradoxical agitation); it is given in a subcutaneous infusion dose of 1.2–2.4 mg/24 hours.

Hyoscine butylbromide is used for bowel colic and for excessive respiratory secretions, and is less sedative than hyoscine hydrobromide. Hyoscine butylbromide is given in a subcutaneous infusion dose of 60–300 mg/24 hours for bowel colic and 20–120 mg/24 hours for excessive respiratory secretions (important: these doses of hyoscine butylbromide must not be confused with the much lower dose of hyoscine hydrobromide, above).

Glycopyrronium 0.6–1.2 mg/24 hours by subcutaneous infusion may also be used.

Convolusions

If a patient has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam is the benzodiazepine antiepileptic of choice for continuous subcutaneous infusion, and it is given initially in a dose of 20–40 mg/24 hours.

Nausea and vomiting

Haloperidol is given in a subcutaneous infusion dose of 2.5–10 mg/24 hours. Levomepromazine is given in a subcutaneous infusion dose of 5–25 mg/24 hours but sedation can limit the dose.

Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and compatibility, below); it is given in a subcutaneous infusion dose of 30–100 mg/24 hours.

Metoclopramide can cause skin reactions; it is given in a subcutaneous infusion dose of 30–100 mg/24 hours.

Octreotide (section 8.3.4.3), which stimulates water and electrolyte absorption and inhibits water secretion in the small bowel, can be used by subcutaneous infusion in a dose of 250–500 micrograms/24 hours to reduce intestinal secretions and to reduce vomiting due to bowel obstruction. Doses of 750 micrograms/24 hours, and occasionally higher, are sometimes required.

Pain control

Diamorphine is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and compatibility, below). The table on p. 24 shows approximate equivalent doses of morphine and diamorphine.

Restlessness and confusion

Haloperidol has little sedative effect; it is given in a subcutaneous infusion dose of 5–15 mg/24 hours.

Levomepromazine has a sedative effect; it is given in a subcutaneous infusion dose of 12.5–200 mg/24 hours. Midazolam is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient; it is given in a subcutaneous infusion dose of 20–100 mg/24 hours.

Mixing and compatibility

The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine, prochlorperazine, and diazepam are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine and levomepromazine also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9%) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used (to avoid precipitation).

The following can be mixed with diamorphine:

- Cyclizine
- Dexamethasone
- Haloperidol
- Hyoscine butylbromide
- Hyoscine hydrobromide
- Levomepromazine
- Metoclopramide
- Midazolam

1. Cyclizine may precipitate at concentrations above 10 mg/mL, or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
2. Special care is needed to avoid precipitation of dexamethasone when preparing it.
3. Mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
4. Under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discoloration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers. The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

Equivalent doses of morphine sulphate and diamorphine hydrochloride given over 24 hours

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection subcutaneously—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.

Prescribing for the elderly

Old people, especially the very old, require special care and consideration from prescribers. Medicines for Older People, a component document of the National Service Framework for Older People, describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing. Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance (see Taking medicines to best effect under General guidance). The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients’ medicines should be reviewed regularly and medicines which are not of benefit should be stopped.

Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and lightheadedness when associated with social stress as in widowhood, loneliness, and family dispersal. In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antithrombotic drugs for atrial fibrillation, antihypertensives, statins, and drugs for osteoporosis.

Form of medicine. Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing. In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as lightheadedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity. The nervous system of elderly patients is more sensitive to many commonly used drugs, such as...
opioid analgesics, benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as antihypertensives and NSAIDs.

Pharmacokinetics
Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients.

The most important effect of age is reduced renal clearance. Many aged patients thus excrete drugs slowly, and are highly susceptible to nephrotoxic drugs. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-tract infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

Adverse reactions
Adverse reactions often present in the elderly in a vague and non-specific fashion. Confusion is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are constipation (with antimuscarinics and many tranquilisers) and postural hypotension and falls (with diuretics and many psychotropics).

Hypnotics Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems (section 4.1.1). Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics Diuretics are overprescribed in old age and should not be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should never continue in perpetuity.

NSAIDs Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk.

Owing to the increased susceptibility of the elderly to the side-effects of NSAIDs the following recommendations are made:

- alternatively, a low-dose NSAID (e.g. ibuprofen up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol;
- do not give two NSAIDs at the same time.

For advice on prophylaxis of NSAID-induced peptic ulcers if continued NSAID treatment is necessary, see section 1.3.

Other drugs Other drugs which commonly cause adverse reactions are antiparkinsonian drugs, antihypertensives, psychotropics, and digoxin. The usual maintenance dose of digoxin in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily. Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole, mianserin) should be avoided unless there is no acceptable alternative.

The elderly generally require a lower maintenance dose of warfarin than younger adults; once again, the outcome of bleeding tends to be more serious.

Guidelines
Always consider whether a drug is indicated at all.

Limit range It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

Reduce dose Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide) should be avoided altogether.

Review regularly Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

Simplify regimens Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

Explain clearly Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like ‘as directed’. Child-resistant containers may be unsuitable.

Repeats and disposal Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities.

If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.
Prescribing in dental practice

The following is a list of topics of particular relevance to dental surgeons.

Advice on the drug management of dental and oral conditions has been integrated into the BNF. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF.

General guidance
Prescribing by dental surgeons, p. 6
Oral side-effects of drugs, p. 13
Medical emergencies in dental practice, below
Medical problems in dental practice, p. 28

Drug management of dental and oral conditions
Dental and orofacial pain, p. 257
Neuropathic pain, p. 272
Non-opioid analgesics and compound analgesic preparations, p. 257
Opioid analgesics, p. 263
Non-steroidal anti-inflammatory drugs, p. 631

Oral infections
Bacterial infections, p. 321
Phenoxymethylpenicillin, p. 333
Broad-spectrum penicillins (amoxicillin and ampicillin), p. 336
Cephalosporins (cefalexin and cefradine), p. 341
Tetracyclines, p. 347
Macrolides (clarithromycin, erythromycin and azithromycin), p. 352
Clindamycin, p. 354
Metronidazole, p. 367
Pusidic acid, p. 735
Fungal infections, p. 695
Local treatment, p. 695
Systemic treatment, p. 373

Viral infections
Herpetic gingivostomatitis, local treatment, p. 696
Herpetic gingivostomatitis, systemic treatment, p. 392 and p. 696
Herpes labialis, p. 739

Anaesthetics, anxiolytics and hypnotics
Anaesthesia, sedation, and resuscitation in dental practice, p. 776
Hypnotics, p. 208
Peri-operative anxiolytics, p. 783
Local anaesthesia, p. 794

Oral ulceration and inflammation, p. 693
Mouthwashes, gargles and dentifrices, p. 697
Dry mouth, p. 698

Minerals
Fluorides, p. 613
Aromatic inhalations, p. 203
Nasal decongestants, p. 691

Dental Practitioners’ Formulary, p. 972
Changes to Dental Practitioners’ Formulary, p. 973

Medical emergencies in dental practice
This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dental surgeons and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. For an algorithm of the procedure for cardiopulmonary resuscitation, see inside back cover.

The drugs referred to in this section include:
- Adrenaline Injection (Epinephrine Injection), adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1-mL amps
- Aspirin Dispersible Tablets 300 mg
- Glucagon Injection, glucagon (as hydrochloride), 1-unit vial (with solvent)
- Glucose (for administration by mouth)
- Glyceryl Trinitrate Spray
- Midazolam Buccal Liquid, midazolam 10 mg/mL or Midazolam Injection, midazolam (as hydrochloride) 2 mg/mL, 5-mL amps, or 5 mg/mL, 2-mL amps
- Oxygen
- Salbutamol Aerosol Inhalation, salbutamol 100 micrograms/metered inhalation

Adrenal insufficiency
Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see also p. 444 for details of corticosteroid cover before dental surgical procedures under general anaesthesia).

Management
- Lay the patient flat
- Give oxygen (see section 3.6)
- Transfer patient urgently to hospital

Anaphylaxis
A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential.

Anaphylactic reactions may also be associated with additives and excipients in foods and medicines (see Excipients, p. 2). Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergenic fats or oils (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).
Asthma

Patients with asthma may have an attack while at the dental surgery, and most attacks will respond to 2 puffs of the patient’s short-acting beta, agonist inhaler such as salbutamol 100 micrograms/puff. Further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, oxygen may be administered (see section 3.6). Arrangements should be made to transfer the patient to hospital urgently.

For further details on the management of anaphylaxis including details of paediatric doses of adrenaline, see p. 197

Management

First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline (epinephrine) injection (section 3.4.3). This is given intramuscularly in a dose of 0.5 mL adrenaline injection 1 in 1000; a dose of 0.3 mL adrenaline injection 1 in 1000 may be appropriate for immediate self-administration. The dose is repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Oxygen administration is also of primary importance (see section 3.6). Arrangements should be made to transfer the patient to hospital urgently.

For further details on the management of anaphylaxis including details of paediatric doses of adrenaline, see p. 197

Epileptic seizures

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

Symptoms and signs

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

Arrhythmias may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers, p. 29.

The pain of myocardial infarction is similar to that of angina but generally more severe and more prolonged. For general advice see also Coronary Artery Disease on p. 29.

Symptoms and signs of myocardial infarction

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

Initial management of myocardial infarction

Call immediately for medical assistance and an ambulance, as appropriate. Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. Oxygen may be administered (see section 3.6). Sublingual glyceryl trinitrate may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see p. 156.

If the patient collapses and loses consciousness attempt standard resuscitation measures. For an algorithm of the procedure for cardiopulmonary resuscitation, see inside back cover.

Cardiac emergencies

If there is a history of angina the patient will probably carry glyceryl trinitrate spray or tablets (or isosorbide dinitrate tablets) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient’s own medication. See also Coronary Artery Disease on p. 29.
Prescribing in dental practice

Management
During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give oxygen (section 3.6) to support respiration if necessary.

Do not attempt to restrain convulsive movements.

After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway. After the convulsion the patient may be confused (‘post-ictal confusion’) and may need reassurance and sympathetically. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred.

Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

Either midazolam buccal liquid or midazolam injection solution can be given by the buccal route [unlicensed use] in a single dose of 10 mg. For further details on the management of status epilepticus, including details of paediatric doses of midazolam, see p. 296.

Focal seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

Hypoglycaemia
Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.

Symptoms and signs
- Shaking and trembling
- Sweating
- ‘Pins and needles’ in lips and tongue
- Hunger
- Palpitation
- Headache (occasionally)
- Double vision
- Difficulty in concentration
- Slurring of speech
- Confusion
- Change of behaviour; truculence
- Convulsions
- Unconsciousness

Management
Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of Lucozade® Energy Original 55 mL, Coca-Cola® 100 mL, Ribena® Blackcurrant 18 mL (to be diluted), 2 teaspoons sugar, and also from 3 sugar lumps. If necessary this may be repeated in 10–15 minutes.

If glucose cannot be given by mouth, if it is ineffective, or if the hypoglycaemia causes unconsciousness, glucagon 1 mg (1 unit) should be given by intramuscular (or subcutaneous) injection; a child under 8 years or of body-weight under 25 kg should be given 500 micrograms. Once the patient regains consciousness oral glucose should be administered as above. If glucagon is ineffective or contra-indicated, the patient should be transferred urgently to hospital. The patient must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

Syncope
Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

Symptoms and signs
- Patient feels faint
- Low blood pressure
- Pallor and sweating
- Yawning and slow pulse
- Nausea and vomiting
- Dilated pupils
- Muscular twitching

Management
- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- Loosen any tight clothing around the neck
- Once consciousness is regained, give sugar in water or a cup of sweet tea

Other possible causes
Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack.

Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision.

Adrenal insufficiency or arrhythmias are other possible causes of syncope, see p. 26 and p. 29.

Medical problems in dental practice

Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition. If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient’s general practitioner or hospital consultant.

For advice on adrenal insufficiency, anaphylaxis, asthma, cardiac emergencies, epileptic seizures, hypoglycaemia and syncope see under Medical Emergencies in Dental Practice.

1. Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, Hypo-Fit®) are available on prescription for the patient to keep to hand in case of hypoglycaemia.
Allergy
Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis on p. 26.

Arrhythmias
Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dental surgeons should be aware that such patients may be receiving anticoagulant therapy. The patient’s medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam) may be useful in some instances for very anxious patients.
See also Cardiac emergencies, p. 27 and Dental Anaesthesia, p. 794.

Cardiac prostheses
For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis, below. For advice on patients receiving anticoagulants, see Thromboembolic disease, below.

Coronary artery disease
Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient’s medical practitioner before commencing treatment. See also Cardiac Emergencies on p. 27.

Treatment with low-dose aspirin (75 mg daily), clopidogrel, or dipyridamole should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease
Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension
Patients with hypertension are likely to be receiving antihypertensive drugs such as those described in section 2.5. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia on p. 794.

Immunosuppression and indwelling intraperitoneal catheters
See Table 2, section 5.1

Infective endocarditis
While almost any dental procedure can cause bacteremia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteremia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Reduction of oral bacteremia
Patients at risk of endocarditis should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:
- need for dental extractions or other surgery;
- chances of severe bacteremia if dental surgery is needed;
- possibility of ‘spontaneous’ bacteremia.

Postoperative care
Patients at risk of endocarditis should be warned to report to the doctor or dental surgeon any unexplained illness that develops after dental treatment. Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

Patients on anticoagulant therapy
For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease, below.

Joint prostheses
See Table 2, section 5.1

Pacemakers
Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer’s literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation (see inside back cover) may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

1. Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endoatralised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.
Prescribing in dental practice

30

Thromboembolic disease

Patients receiving a heparin or an oral anticoagulant such as warfarin, acenocoumarol (nicoumalone), phenindione, dabigatran etexilate, or rivaroxaban may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed.

For a patient requiring long-term therapy with warfarin, the patient’s medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If possible, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin, the advice of the clinician responsible for the patient’s anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytoenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are contra-indicated in patients on anticoagulant therapy, and in those with any disorder of haemostasis.

A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine, imidazole and triazole antifungals (including miconazole), erythromycin, clarithromycin, and metronidazole; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins). Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin or amoxicillin.

Information on the treatment of patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant

Liver disease

Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with jaundice, ascites, or evidence of encephalopathy.

For guidance on prescribing for patients with hepatic impairment, see p. 17. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Renal impairment

The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists.

For guidance on prescribing in patients with renal impairment, see p. 17. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

Pregnancy

Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester.

For guidance on prescribing in pregnancy, see p. 19. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Breast-feeding

Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant.

For guidance on prescribing in breast-feeding, see p. 19. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.
UK Anti-Doping advises that athletes are personally responsible should a prohibited substance be detected in their body. An advice card listing examples of permitted and prohibited substances is available from:

UK Anti-Doping
Oceanic House
1a Cockspur Street
London SW1Y 5BG
Tel: (020) 7766 7350
information@ukad.org.uk
www.ukad.org.uk

A similar card detailing classes of drugs and doping methods prohibited in football is available from the Football Association. This contains information specific to the Football Association Doping Control Regulations including the Football Association’s policy on social drugs. Further information is available at www.thefa.com.

**General Medical Council’s advice**

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.
Emergency treatment of poisoning

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service (see below) be consulted when there is doubt about the degree of risk or about management.

Hospital admission  Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin, iron, paracetamol, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, Lomotil®); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information and advice

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service.

Help with identifying capsules or tablets may be available from a regional medicines information centre (see inside front cover) or (out of hours) from the National Poisons Information Service. Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number:

Tel: 0844 892 0111

National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by tilting down the head of the bed and administration of either sodium chloride intravenous infusion or a colloidal infusion. Vasoconstrictor sympathomimetics (section 2.7.2) are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amfetamines, phenycyclidine, and cocaine.

Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment (section 2.3.1). If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.
Emergency treatment of poisoning

Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hypothermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

Convulsions

Single short-lived convulsions do not require treatment. If convulsions are protracted or recur frequently, lorazepam 4 mg or diazepam (preferably as emulsion) 10 mg should be given by slow intravenous injection into a large vein (section 4.8.2). Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, diazepam can be administered as a rectal solution or midazolam [unlicensed use] can be given by the buccal route (section 4.8.2).

Removal and elimination

Prevention of absorption

Given by mouth, activated charcoal can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

For the use of charcoal in active elimination techniques, see below.

Active elimination techniques

Repeated doses of activated charcoal by mouth enhance the elimination of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

The usual dose of activated charcoal in adults and children over 12 years of age is 50 g initially then 50 g every 4 hours. Vomiting should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased (e.g. 25 g every 2 hours or 12.5 g every hour) but this may compromise efficacy.

In children under 12 years of age, activated charcoal is given in a dose of 1 g/kg (max. 50 g) every 4 hours; the dose may be reduced and the frequency increased if not tolerated.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalinisation of the urine for salicylates.

Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of emesis (e.g. with ipecacuanha) is not recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract (‘body-packing’). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

**CHARGOAL, ACTIVATED**

**Indications** reduction of absorption of poisons in the gastro-intestinal system; see also active elimination techniques, above

**Cautions** drowsy or comatose patient (risk of aspiration, ensure airway protected); reduced gastro-intestinal motility (risk of obstruction); not for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, and metal salts including iron and lithium salts

**Side-effects** black stools

**Dose**

- Reduction of absorption. ADULT and CHILD over 12 years, 50 g; CHILD under 12 years, 1 g/kg (max. 50 g)
- Active elimination, see notes above

**Note** Activated charcoal doses in BNF may differ from those in product literature. Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste

**Actidose-Aqua® Advance** (Alliance)

**Oral suspension**, activated charcoal 1.04 g/5 mL, net price 50-g pack (240 mL) = £8.69
Emergency treatment of poisoning

Aspirin

The main features of salicylate poisoning are analgesics (non-opioid) is measured and glucose given if indicated. Maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose measured and glucose given if indicated.

Plasma-potassium concentration should be corrected if paracetamol in excess of 150 mg/kg or 12 g, whichever is the smaller (or in excess of 75 mg/kg for those considered to be at high risk; see below), is thought to have been ingested within the previous hour. Acetylcysteine protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. In patients who present 8–36 hours after a potentially toxic ingestion, acetylcysteine treatment should commence immediately even if plasma-paracetamol concentrations are not yet available; if more than 24 hours have elapsed since ingestion advice should be sought from the National Poisons Information Service. Giving acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information Service for advice on risk assessment and management.

Paracetamol

In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Specific drugs

Alcohol

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose measured and glucose given if indicated.

Anaesthesia are an important cause of death, additional features are may complicate alkalisation of the urine. Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

NSAIDs

Mefenamic acid has important consequences in overdose because it can cause convulsions, which if prolonged or recurrent require treatment, see p. 33. Overdose with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Activated charcoal followed by symptomatic measures are indicated if more than 400 mg/kg has been ingested within the preceding hour.

Carbomix® (Beacon)

Powder, activated charcoal, net price 25-g pack = £8.50, 50-g pack = £11.90

Charcodote® (TEVA UK)

Oral suspension, activated charcoal 1 g/5 mL, net price 50-g pack = £11.88

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night
Patients at high-risk of liver damage include those:
- taking liver enzyme-inducing drugs (e.g. carbamazepine, phenobarbital, phenytoin, primidone, rifampicin, rifabutin, efavirenz, nevirapine, alcohol, St John’s wort);
- who are malnourished (e.g. in anorexia or bulimia, cystic fibrosis, hepatitis C, in alcoholism, or those who are HIV-positive);
- who have not eaten for a few days.

These patients can develop toxicity at lower plasma-paracetamol concentration and should be treated if the concentration is above the high-risk treatment line (which joins plots that are at 50% of the plasma-paracetamol concentrations of the normal treatment line).

The prognostic accuracy of plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration above the relevant treatment line should be regarded as carrying a serious risk of liver damage.

Patients whose plasma-paracetamol concentrations are above the normal treatment line should be treated with acetylcysteine by intravenous infusion (or, if acetylcysteine cannot be used, with methionine by mouth, provided the overdose has been taken within 10–12 hours and the patient is not vomiting).

Patients at high-risk of liver damage include those:
- taking liver enzyme-inducing drugs (e.g. carbamazepine, phenobarbital, phenytoin, primidone, rifampicin, rifabutin, efavirenz, nevirapine, alcohol, St John’s wort);
- who are malnourished (e.g. in anorexia or bulimia, cystic fibrosis, hepatitis C, in alcoholism, or those who are HIV-positive);
- who have not eaten for a few days.

These patients should be treated if their plasma-paracetamol concentration is above the high-risk treatment line.

The prognostic accuracy after 15 hours is uncertain but a plasma-paracetamol concentration above the relevant treatment line should be regarded as carrying a serious risk of liver damage.

Graph reproduced courtesy of University of Wales College of Medicine Therapeutics and Toxicology Centre

Patients at high-risk of liver damage include those:
- taking liver enzyme-inducing drugs (e.g. carbamazepine, phenobarbital, phenytoin, primidone, rifampicin, rifabutin, efavirenz, nevirapine, alcohol and St John’s wort);
- who are malnourished (e.g. in anorexia or bulimia, cystic fibrosis, hepatitis C, in alcoholism, or those who are HIV-positive);
- who have not eaten for a few days.

These patients can develop toxicity at lower plasma-paracetamol concentration and should be treated if the concentration is above the high-risk treatment line (which joins plots that are at 50% of the plasma-paracetamol concentrations of the normal treatment line).

The prognostic accuracy of plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration above the relevant treatment line should be regarded as carrying a serious risk of liver damage.
Emergency treatment of poisoning

The plasma-paracetamol concentration may be difficult to interpret when paracetamol has been ingested over several hours. If there is doubt about timing or the need for treatment then the patient should be treated with an antidote.

**AcETYLCYSTEINE**

**Indications** paracetamol overdosage, see notes above

**Cautions** asthma (see side-effects below but do not delay acetylcysteine treatment)

**Side-effects** hypersensitivity-like reactions managed by reducing infusion rate or suspending until reaction settled (rash also managed by giving antihistamine; acute asthma managed by giving nebulised short-acting beta, agonist)—contact the National Poisons Information Service if reaction severe

**Dose**

- By intravenous infusion, ADULT and CHILD, initially 150 mg/kg (max. 16.5 g) over 15 minutes, then 50 mg/kg (max. 5.5 g) over 4 hours then 100 mg/kg (max. 11 g) over 16 hours

**Administration** Dilute requisite dose in glucose intravenous infusion 5% as follows: ADULT and CHILD over 12 years, initially 200 mL given over 15 minutes, then 500 mL over 4 hours, then 1 litre over 16 hours; CHILD under 12 years, body-weight over 20 kg, initially 100 mL given over 15 minutes, then 250 mL over 4 hours, then 500 mL over 16 hours; CHILD body-weight under 20 kg, initially 3 mL/kg given over 15 minutes, then 7 mL/kg over 4 hours, then 14 mL/kg over 16 hours

**Note** Manufacturer also recommends other infusion fluids, but glucose 5% is preferable

**Acetylcysteine** (Non-proprietary) [PH]

**Injection**, acetylcysteine 200 mg/mL, net price 10-mL amp = £1.96

**Parvolex** (UCB Pharma) [PH]

**Injection**, acetylcysteine 200 mg/mL, net price 10-mL amp = £2.25

**METHIONINE**

**Indications** paracetamol overdosage, see notes above

**Hepatic impairment** may precipitate coma

**Side-effects** nausea, vomiting, drowsiness, irritability

**Dose**

- ADULT and CHILD over 6 years initially 2.5 g, followed by 3 further doses of 2.5 g every 4 hours; CHILD under 6 years initially 1 g, followed by 3 further doses of 1 g every 4 hours

**Methionine** (Pharma Nord)

Tablets, f/c, methionine 500 mg, net price 20-tab pack = £9.95

**With paracetamol (co-methiamol)**

Section 4.7.1

**Analgesics (opioid)**

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses. Naloxone reverses the opioid effects of dextropropoxyphene; the long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate, or magnesium sulphate, or both; arrhythmias may occur for up to 12 hours.

**Naloxone Hydrochloride**

**Indications** overdosage with opioids; reversal of opioid-induced respiratory depression and reversal of neonatal respiratory depression resulting from opioid administration to mother during labour (section 15.1.7)

**Cautions** physical dependence on opioids; cardiac irritability; naloxone is short-acting, see notes above

**Pregnancy** section 15.1.7

**Breast-feeding** section 15.1.7

**Dose**

- By intravenous injection, 0.4–2 mg; if no response repeat at intervals of 2–3 minutes to a max. of 10 mg (then review diagnosis); further doses may be required if respiratory function deteriorates; CHILD 10 micrograms/kg; if no response give subsequent dose of 100 micrograms/kg (then review diagnosis); further doses may be required if respiratory function deteriorates

- By subcutaneous or intramuscular injection, ADULT and CHILD dose as for intravenous injection but use only if intravenous route not feasible (onset of action slower)

- By continuous intravenous infusion using an infusion pump, rate adjusted according to response (initial rate may be set at 60% of initial intravenous injection dose (see above) and infused over 1 hour)

**Important** Doses used in acute opioid overdose may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use; see also section 15.1.7 for management of postoperative respiratory depression

1. Naloxone (Non-proprietary) [PH]

**Injection**, naloxone hydrochloride 20 micrograms/mL, net price 2-mL amp = £5.50; 400 micrograms/mL, 1-mL amp = £4.10; 1 mg/mL, 2-mL prefilled syringe = £8.36

2. Minijet® Naloxone (UCB Pharma) [PH]

**Injection**, naloxone hydrochloride 400 micrograms/mL, net price 1-mL disposable syringe = £20.40, 2-mL disposable syringe = £12.96, 5-mL disposable syringe = £12.68

1. **PH** restriction does not apply where administration is for saving life in emergency
Antidepressants

Tricyclic and related antidepressants Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

Selective serotonin re-uptake inhibitors (SSRIs) Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or buccal midazolam [unlicensed use] (see p. 33). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Antimalarials

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Calcium-channel blockers

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Activated charcoal should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride or calcium gluconate (section 9.5.1.1) is given by injection; atropine is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Hypnotics and anxiolytics

Benzzodiazepines Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Activated charcoal can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

to another; propranolol overdosage in particular may cause coma and convulsions.

Acute massive overdosage must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine is required to treat bradycardia (3 mg for an adult, 40 micrograms/kg (max. 3 mg) for a child). Cardiogenic shock unresponsive to atropine is probably best treated with an intravenous injection of glucagon 2–10 mg (child 50–150 micrograms/kg, max. 10 mg [unlicensed indication and dose] in glucose 5% [with precautions to protect the airway in case of vomiting] followed by an intravenous infusion of 50 micrograms/kg/hour. If glucagon is not available, intravenous isoprenaline [available from 'special-order' manufacturers or specialist importing companies, see p. 988] is an alternative. A cardiac pacemaker can be used to increase the heart rate.
Iron salts

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepato cellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine should be given immediately without waiting for the result of the serum-iron measurement.

DESFERRIOXAMINE MESILATE
(Dexferoxamine Mesilate)

Indications iron poisoning; chronic iron overload (section 9.1.3)
Cautions section 9.1.3
Renal impairment section 9.1.3
Pregnancy section 9.1.3
Breast-feeding section 9.1.3
Side-effects section 9.1.3
Dose
- By continuous intravenous infusion, ADULT and CHILD up to 15 mg/kg/hour, reduced after 4–6 hours; max. 80 mg/kg in 24 hours (in severe cases, higher doses on advice from the National Poisons Information Service)

Preparations Section 9.1.3

Lithium

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient’s depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within 1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service, p. 32.

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyazine (section 4.9.2) or diazepam (section 4.8.2, emulsion preferred).

Atypical antipsychotic drugs

Features of poisoning by atypical antipsychotic drugs (section 4.2.1) include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Activated charcoal can be given within 1 hour of ingesting a significant quantity of an atypical antipsychotic drug.

Stimulants

Amphetamines Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam or lorazepam; advice should be sought from the National Poisons Information Service (p. 32) on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature, p. 33); hypertension and cardiac effects require specific treatment and expert advice should be sought.
Ecstasy  Ecstasy (methyleneoxydemethamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hypernatremia has also been associated with ecstasy use.

Treatment of methyleneoxydemethamine poisoning is supportive, with diazepam to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

‘Liquid ecstasy’ is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restless, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques, p. 33). Ondansetron (section 4.6) may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions, p. 33). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a short-acting beta-blocker (section 2.4) can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Other poisons

Consult either the National Poisons Information Service day and night or TOXBASE, see p. 32.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

Cyanides

Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite followed by sodium thiosulphate is an alternative if dicobalt edetate is not available.

Hydroxocobalamin (Cyanokit®—no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

**DICOBALT EDETATE**

**Indications** severe poisoning with cyanides

**Cautions** owing to toxicity it should be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness; not to be used as a precautionary measure

**Side-effects** hypotension, tachycardia, and vomiting; anaphylactoid reactions including facial and laryngeal oedema and cardiac abnormalities

**Dose**

- By intravenous injection, ADULT 300 mg over 1 minute (5 minutes if condition less serious) followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity; CHILD consult the National Poisons Information Service

**HYDROXOCOBALAMIN**

**Indications** see notes above

**Side-effects** gastro-intestinal disturbances, transient hypertension, peripheral oedema, dyspnœa, throat disorders, hot flush, dizziness, headache, restlessness, memory impairment, red coloration of urine, lymphocytopenia, eye disorders, pustular rashes, pruritus, reversible red coloration of skin and mucous membranes

**Dose**

- By intravenous infusion, ADULT 5 g over 15 minutes; a second dose of 5 g can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability; CHILD 70 mg/kg (max. 5 g) over 15 minutes; a second dose of 70 mg/kg (max. 5 g) can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

**Cyanokit®** (Swedish Orphan) •

Intravenous infusion, powder for reconstitution, hydroxocobalamin, net price 2 x 2.5-g vials = £772.00

Note: Deep red colour of hydroxocobalamin may interfere with laboratory tests (see Side-effects, above)
Emergency treatment of poisoning

Dose

- By intravenous injection over 5–20 minutes (as sodium nitrite injection 30 mg/mL), 300 mg; CHILD 4–10 mg/kg (max. 300 mg)

1 Sodium Nitrite (Patentin)
Injection, sodium nitrite 3% (30 mg/mL) in water for injections
Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

SODIUM THIOSULPHATE

Indications in conjunction with sodium nitrite for cyanide poisoning

Dose

- By intravenous injection over 10 minutes (as sodium thioulsulphate injection 500 mg/mL), 12.5 g; dose may be repeated in severe cyanide poisoning if dicobalt edetate not available

1 Sodium Thiosulphate (Patentin)
Injection, sodium thioulsulphate 50% (500 mg/mL) in water for injections
Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

Ethylene glycol and methanol

Fomepizole (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metals

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate, and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

SODIUM CALCIUM EDETATE
(Sodium Calciumedetate)

Indications lead poisoning
Renal impairment use with caution in mild impairment: avoid in moderate to severe impairment—contact the National Poisons Information Service for advice
Side-effects nausea, diarrhoea, abdominal pain, pain at site of injection, thrombophlebitis if given too

1. *Patent restriction does not apply where administration is for saving life in emergency*

rapidly, renal damage particularly in overdosage; hypotension, lacrimation, myalgia, nasal congestion, sneezing, malaise, thirst, fever, chills, headache, and zinc depletion also reported

Dose

- By intravenous infusion, ADULT and CHILD 40 mg/kg twice daily for up to 5 days; if necessary, a second course can be given at least 7 days after the first course, a third course can be given at least 7 days after the second course

Ledclair® (Durbin) (Patentin)
Injection, sodium calcium edetate 200 mg/mL, net price 5-mL amp = £7.29

Noxious gases

Carbon monoxide Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces. Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol (section 2.2.5). Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulphur dioxide, chlorine, phosgene, ammonia All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray

CS spray, which is used for riot control, irritates the eyes (hence ‘tear gas’) and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with
Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the skin. In severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning (see below), but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits (‘NAAS pods’) containing pralidoxime can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Snake bites and animal stings

Snake bites. Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (Vipera berus). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with adrenaline (epinephrine) (section 3.4.3). Indications for antivenom treatment include systemic envenoming, especially hypotension (see above). ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For both adults and children, the contents of one vial (10 mL) of European viper venom antiserum (available from Movianto) is given by intravenous injection over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride intravenous infusion 0.9% (use 5 mL diluent/kg body-weight). The dose can be repeated after 1–2 hours if symptoms of systemic envenoming persist. However, for those patients who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot features of systemic envenoming persist. However, for those patients who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot
to above the knee or from the hand to above the elbow within 2 hours of the bite), an initial dose of 2 vials (20 mL) of the antiserum is recommended; if symptoms of systemic envenoming persist contact the National Poisons Information Service. Adrenaline (epinephrine) injection must be immediately to hand for treatment of anaphylactic reactions to the antivenom (for the management of anaphylaxis, see section 3.4.3). Antivenom is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service (see p. 32).

**Insect stings** Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular adrenaline (epinephrine); self-administered intramuscular adrenaline (e.g. EpiPen®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions. For the management of anaphylaxis, see section 3.4.3. A short course of an oral antihistamine or a topical corticosteroid may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings (section 3.4.2).

**Marine stings** The severe pain of weeverfish (Trachinus vipera) and Portuguese man-o’-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o’-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should not be applied because they can cause further discharge of stinging hairs. Ice packs will reduce pain and a slurry of baking soda (sodium bicarbonate), but not vinegar, may be useful for treating stings from UK species.
1 Gastro-intestinal system

1.1 Dyspepsia and gastro-oesophageal reflux disease 43
  1.1.1 Antacids and simeticone 44
  1.1.2 Compound alginates and proprietary indigestion preparations 46

1.2 Antispasmodics and other drugs altering gut motility 47

1.9.3 Aprotinin 79
1.9.4 Pancreatin 79

This chapter also includes advice on the drug management of the following:
- *Clostridium difficile* infection, p. 60
- constipation, p. 67
- Crohn’s disease, p. 59
- diverticular disease, p. 61
- food allergy, p. 66
- *Helicobacter pylori* infection, p. 49
- irritable bowel syndrome, p. 61
- NSAID-associated ulcers, p. 50
- ulcerative colitis, p. 59

Dyspepsia

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration (section 1.3) and gastric cancer but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by ‘alarm features’ (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (see Gastro-oesophageal reflux disease, below). Some medications may cause dyspepsia—these should be stopped, if possible. Antacids may provide some symptomatic relief.

If symptoms persist in uninvestigated dyspepsia, treatment involves a proton pump inhibitor (section 1.3.5) for 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for *Helicobacter pylori* and given eradication therapy (section 1.3) if *H. pylori* is present. Alternatively, particularly in populations where *H. pylori* infection is more likely, the ‘test and treat’ strategy for *H. pylori* can be used before a trial with a proton pump inhibitor.
If H. pylori is present in patients with functional (investigated, non-ulcer) dyspepsia, eradication therapy should be provided. If symptoms persist, treatment with either a proton pump inhibitor (section 1.3.5) or a histamine H2-receptor antagonist (section 1.3.1) can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long term. However, most patients with functional dyspepsia do not benefit symptomatically from H. pylori eradication therapy or antisecretory drugs.

### Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed.

For mild symptoms of gastro-oesophageal reflux disease, initial management may include the use of antacids and alginates. Alginate-containing antacids can form a ‘raft’ that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa. Histamine H2-receptor antagonists (section 1.3.1) may relieve symptoms and permit reduction in antacid consumption. However, proton pump inhibitors (section 1.3.5) provide more effective relief of symptoms than H2-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For severe symptoms of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. oesophagitis, oesophageal ulceration, oesophagopharyngeal reflux, Barrett’s oesophagus), initial management involves the use of a proton pump inhibitor (section 1.3.5); patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting treatment with a histamine H2-receptor antagonist). However, for endoscopically confirmed erosive, ulcerative, or strictureing disease, or Barrett’s oesophagus, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

A prokinetic drug such as metoclopramide (section 4.6) may improve gastro-oesophageal sphincter function and accelerate gastric emptying.

### Antacids and simeticone

**Children** Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietitian—see Appendix 7 for suitable products). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, lifestyle changes similar to those for adults (see above) may be helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H2-receptor antagonist (section 1.3.1) may be needed to reduce acid secretion. If the oesophagitis is resistant to H2-receptor blockade, the proton pump inhibitor omeprazole (section 1.3.5) can be tried.

**Antacids (usually containing aluminium or magnesium compounds)** can often relieve symptoms in ulcer dyspepsia and in non-erosive gastro-oesophageal reflux (see also section 1.1); they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, 4 or more times daily; additional doses may be required up to once an hour. Conventional doses e.g. 10 mL 3 or 4 times daily of liquid magnesium–aluminium antacids promote ulcer healing, but less well than antisecretory drugs (section 1.3); proof of a relationship between healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations.

Aluminium- and magnesium-containing antacids (e.g. aluminium hydroxide, and magnesium carbonate, hydroxide and trisilicate), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal.

The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as hydrotalcite confer no special advantage.

**Sodium bicarbonate** should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders (section 7.4.3) and acidosis (section 9.2.1.3 and section 9.2.2). Sodium bicarbonate should be avoided in patients on salt-restricted diets.

**Bismuth-containing** antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating. **Calcium-containing** antacids (section 1.1.2)
can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

**Simeticone** (activated dimeticone) is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care. **Alginates**, added as protectants, may be useful in gastro-oesophageal reflux disease (section 1.1 and section 1.1.2). The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

See also section 1.3 for drugs used in the treatment of peptic ulceration.

**Hepatic impairment** In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids that cause constipation because this can precipitate coma. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

**Renal impairment** In patients with fluid retention, avoid antacids containing large amounts of sodium. There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, with antacids containing aluminium salts. Absorption of aluminium and magnesium hydroxide in hepatic coma if there is a risk of renal failure.

**Interactions** Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may also damage enteric coatings (such as effervescent analgesics). Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.

**Side-effects**

- **Diarrhoea**
- **Belching due to liberated carbon dioxide**
- **Rebound acid secretion**
- **Hypercalcaemia**
- **Alkalosis**

**Magnesium carbonate** (activated as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care. **Alginates**, added as protectants, may be useful in gastro-oesophageal reflux disease (section 1.1 and section 1.1.2). The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

See also section 1.3 for drugs used in the treatment of peptic ulceration.

**Hepatic impairment** In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids that cause constipation because this can precipitate coma. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

**Renal impairment** In patients with fluid retention, avoid antacids containing large amounts of sodium. There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, with antacids containing aluminium salts. Absorption of aluminium and magnesium hydroxide in hepatic coma if there is a risk of renal failure.

**Interactions** Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may also damage enteric coatings (such as effervescent analgesics). Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.

**Side-effects**

- **Diarrhoea**
- **Belching due to liberated carbon dioxide**
- **Rebound acid secretion**
- **Hypercalcaemia**
- **Alkalosis**

**Magnesium carbonate**

- **Indications** dyspepsia
- **Cautions** see notes above; **interactions**: Appendix 1 (antacids)
- **Contra-indications** hypophosphataemia
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above; magnesium carbonate mixture has a high sodium content
- **Side-effects** diarrhoea; belching due to liberated carbon dioxide

**Aromatic Magnesium Carbonate Mixture, BP**

- **Indications** dyspepsia
- **Cautions** see under Magnesium Carbonate
- **Contra-indications** see under Magnesium Carbonate
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above; magnesium trisilicate mixture has a high sodium content
- **Side-effects** diarrhoea, belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

**Magnesium Trisilicate Tablets, Compound, BP**

- **Indications** dyspepsia
- **Cautions** see under Magnesium Carbonate
- **Contra-indications** see under Magnesium Carbonate
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above; magnesium trisilicate mixture has a high sodium content
- **Side-effects** diarrhoea, belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

**Aluminium and magnesium-containing antacids**

**Aluminium hydroxide**

- **Indications** dyspepsia; hyperphosphataemia (section 9.5.2.2)
- **Cautions** see notes above; **interactions**: Appendix 1 (antacids)
- **Contra-indications** hypophosphataemia; neonates and infants
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above
- **Side-effects** see notes above

**Aluminium-only preparations**

- **Alu-Cap®** (Meda)
  - **Capsules**, green/red, dried aluminium hydroxide 475 mg (low Na+). Net price 120-cap pack = £3.75
  - **Dose** antacid, 1 capsule 4 times daily and at bedtime; **CHILD** not recommended for antacid therapy

**Antacids and simeticone**

**Co-magaldrox**

- **Co-magaldrox** is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively

**Maalox®** (Sanofi-Aventis)

- **Suspension**, sugar-free, co-magaldrox 195/220 (magnesium hydroxide 195 mg, dried aluminium hydroxide 220 mg/5 mL (low Na+)). Net price 500 mL = £2.79
  - **Dose** ADULT and CHILD over 14 years, 10–20 mL 20–60 minutes after meals and at bedtime or when required

**Mucogel®** (Chemidex)

- **Suspension**, sugar-free, co-magaldrox 195/220 (magnesium hydroxide 195 mg, dried aluminium hydroxide 220 mg/5 mL (low Na+)). Net price 500 mL = £1.71
  - **Dose** ADULT and CHILD over 12 years, 10–20 mL 3 times daily, 20–60 minutes after meals, and at bedtime or when required

**MAGNESIUM CARBONATE**

- **Indications** dyspepsia
- **Cautions** see notes above; **interactions**: Appendix 1 (antacids)
- **Contra-indications** hypophosphataemia
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above; magnesium carbonate mixture has a high sodium content
- **Side-effects** diarrhoea; belching due to liberated carbon dioxide

**Aromatic Magnesium Carbonate Mixture, BP**

- **Indications** dyspepsia
- **Cautions** see under Magnesium Carbonate
- **Contra-indications** see under Magnesium Carbonate
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above; magnesium trisilicate mixture has a high sodium content
- **Side-effects** diarrhoea, belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

**Magnesium Trisilicate Tablets, Compound, BP**

- **Indications** dyspepsia
- **Cautions** see under Magnesium Carbonate
- **Contra-indications** see under Magnesium Carbonate
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above; magnesium trisilicate mixture has a high sodium content
- **Side-effects** diarrhoea, belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

**Magnesium Trisilicate**

- **Indications** dyspepsia
- **Cautions** see under Magnesium Carbonate
- **Contra-indications** see under Magnesium Carbonate
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above; magnesium trisilicate mixture has a high sodium content
- **Side-effects** diarrhoea, belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

**Aluminium hydroxide**

- **Indications** dyspepsia; hyperphosphataemia (section 9.5.2.2)
- **Cautions** see notes above; **interactions**: Appendix 1 (antacids)
- **Contra-indications** hypophosphataemia; neonates and infants
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above
- **Side-effects** see notes above

**Aluminium-only preparations**

- **Alu-Cap®** (Meda)
  - **Capsules**, green/red, dried aluminium hydroxide 475 mg (low Na+). Net price 120-cap pack = £3.75
  - **Dose** antacid, 1 capsule 4 times daily and at bedtime; **CHILD** not recommended for antacid therapy
**1.1.2 Compound alginates and proprietary indigestion preparations**

**Aluminium-magnesium complexes**

**HYDROTALCITE**
Aluminium magnesium carbonate hydroxide hydrate

**Indications** dyspepsia

**Cautions** see notes above; interactions: Appendix 1 (antacids)

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Side-effects** see notes above

*With simeticone*

**Altacite Plus** (Peckforton)

**Suspension**, sugar-free, co-simalcite 125/500 (simeticone 125 mg, hydroxyaluminate 500 mg)/5 mL (low Na⁺).

Net price 500 mL = £2.79

Dose 10 mL between meals and at bedtime when required; CHILD 8–12 years 5 mL between meals and at bedtime when required

**Asilone** (Thornton & Ross)

**Suspension**, sugar-free, dried aluminium hydroxide 420 mg, simeticone 135 mg, light magnesium oxide 70 mg/5 mL (low Na⁺). Net price 500 mL = £1.95

Dose ADULT and CHILD over 12 years, 5–10 mL after meals and at bedtime or when required up to 4 times daily

**Maalox Plus** (Sanofi-Aventis)

**Suspension**, sugar-free, dried aluminium hydroxide 220 mg, simeticone 25 mg, magnesium hydroxide 195 mg/5 mL (low Na⁺). Net price 500 mL = £2.79

Dose 5–10 mL 4 times daily (after meals and at bedtime) or when required; CHILD under 12 years see BNF for Children

**Simeticone alone**

Simeticone (activated dimeticone) is an antifoaming agent. It is licensed for infantile colic but evidence of benefit is uncertain.

**Dentinox** (DDO)

**Colic drops** (= emulsion), simeticone 21 mg/2.5-mL dose. Net price 100 mL = £1.73

Dose colic or wind pains, NEONATE and INFANT 2.5 mL with or after each feed (max. 6 doses in 24 hours); may be added to bottle feeds

*Note* The brand name Dentinox® is also used for other preparations including teething gel

**Infacol** (Forest)

**Liquid**, sugar-free, simeticone 40 mg/mL (low Na⁺). Net price 50 mL = £2.26. Counselling, use of dropper

Dose colic or wind pains, NEONATE and INFANT 0.5–1 mL before feeds

**Altacite Plus** see below

**Antacid preparations containing simeticone**

**Altacite Plus**® (Thornton & Ross)

**Suspension**, sugar-free, dried aluminium hydroxide 195 mg/5 mL (low Na⁺). Net price 500 mL = £1.95

Dose 10–20 mL after meals and at bedtime; CHILD 6–12 years 5–10 mL after meals and at bedtime

**Peptac**® (IVAX)

**Suspension**, sugar-free, sodium bicarbonate 133.5 mg, calcium carbonate 80 mg/5 mL. Contains about 3 mmol Na⁺/5 mL. Net price 500 mL (aniseed- or peppermint-flavoured) = £2.30

Dose 10–20 mL after meals and at bedtime; CHILD 6–12 years 5–10 mL after meals and at bedtime

**Other compound alginate preparations**

**Gaviscon**® (Actavis)

**Tablets**, alginic acid 200 mg, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium bicarbonate 70 mg. Contains about 1 mmol Na⁺/tablet. Net price 100-tab pack = £3.51

*Cautions* diabetes mellitus (high sugar content)

Dose ADULT and CHILD over 6 years, 1–2 tablets chewed 4 times daily (after meals and at bedtime)

**Liquid**, sugar-free, peach-coloured, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium alginate 220 mg, sodium bicarbonate 70 mg/5 mL. Contains 2.13 mmol Na⁺/5 mL. Net price 500 mL = £2.67

Dose 5–15 mL 4 times daily (after meals and at bedtime); CHILD 6–12 years, 5–10 mL 4 times daily (after meals and at bedtime)

**Gaviscon® Advance** (Reckitt Benckiser)

**Tablets**, sugar-free, sodium alginate 500 mg, potassium bicarbonate 100 mg. Contains 2.25 mmol Na⁺, 1 mmol K⁺/tablet. Net price 60-tab pack (peppermint-flavoured) = £3.07

*Excipients* include aspartame (section 9.4.1)

Dose ADULT and CHILD over 12 years, 1–2 tablets to be chewed after meals and at bedtime; CHILD 6–12 years, 1 tablet to be chewed after meals and at bedtime (under medical advice only)

**Suspension**, sugar-free, aniseed- or peppermint flavour, sodium alginate 500 mg, potassium bicarbonate
Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Cautions Antimuscarinics should be used with caution in Down's syndrome, in children and in the elderly; they should also be used with caution in gastro-oesophageal reflux disease, diarrhoea, ulcerative colitis, autonomic neuropathy, acute myocardial infarction, hypertension, conditions characterised by tachycardia (including hyperthyroidism, cardiac insufficiency, cardiac surgery), pyrexia, and in individuals susceptible to angle-closure glaucoma. Interactions: Appendix 1 (antimuscarinics).

Contra-indications Antimuscarinics are contra-indicated in myasthenia gravis (but may be used to decrease muscarnic side-effects of anticholinesterases—section 10.2.1), paralytic ileus, pyloric stenosis, toxic megacolon, and prostatic enlargement.

Side-effects Side-effects of antimuscarinics include constipation, transient bradycardia (followed by tachycardia, palpitation and arrhythmias), reduced bronchial secretions, urinary urgency and retention, dilatation of the pupils with loss of accommodation, photophobia, dry mouth, flushing and dryness of the skin. Side-effects that occur occasionally include confusion (particularly in the elderly), nausea, vomiting, and giddiness; very rarely, angle-closure glaucoma may occur.

**ATROPINE SULPHATE**

Indications symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm; mydriasis and cycloplegia (section 11.5); premedication (section 15.1.3); see also notes above

Cautions see notes above

Contra-indications see notes above

Pregnancy not known to be harmful; manufacturer advises caution

Breast-feeding small amount present in milk—manufacturer advises caution

Side-effects see notes above

**Dose**

- 0.6–1.2 mg at night

**Atropine** (Non-proprietary) 

Tablets, atropine sulphate 600 micrograms. Net price 28-tab pack = £17.59

**DICYCLOVERINE HYDROCHLORIDE**

(Dicyclomine hydrochloride)

Indications symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

Cautions see notes above

1.2 Antispasmodics and other drugs altering gut motility

Drugs in this section include antimuscarinic compounds and drugs believed to be direct relaxants of intestinal smooth muscle. The smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in irritable bowel syndrome and in diverticular disease.

The dopamine-receptor antagonists metoclopramide and domperidone (section 4.6) stimulate transit in the gut.

**Antimuscarinics**

Antimuscarinics (formerly termed ‘anticholinergics’) reduce intestinal motility. They are used for the management of irritable bowel syndrome and diverticular disease. However, their value has not been established and response varies. Other indications for antimuscarinic drugs include arrhythmias (section 2.3.1), asthma and airways disease (section 3.1.2), motion sickness (section 4.6), parkinsonism (section 4.9.2), urinary incontinence (section 7.4.2), mydriasis and cycloplegia (section 11.5), premedication (section 15.1.3) and as an antidote to organophosphorus poisoning (p. 41).

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulphate and dicycloverine hydrochloride and the quaternary ammonium compounds propantheline bromide and hyoscine butylbromide. The quaternary ammonium compounds are less lipid soluble than atropine and are less likely to cross the blood–brain barrier; they are also less well absorbed from the gastro-intestinal tract.

100 mg/5 mL. Contains 2.3 mmol Na+, 1 mmol K+/5 mL, net price 250 mL = £2.56, 500 mL = £5.12

**Dose**

**ADULT** and **CHILD** over 12 years, 5–10 mL after meals and at bedtime; **CHILD** 2–12 years, 2.5–5 mL after meals and at bedtime (under medical advice only)

**Gaviscon Infant®** (Reckitt Benckiser)

**Oral powder**; sugar-free, sodium alginate 225 mg, magnesium alginate 87.5 mg, with colloidal silica and mannitol/dose. Contains 0.92 mmol Na+/dose. Net price 30 doses = £2.46

**Dose**

**INFANT** body-weight under 4.5 kg, 1 ‘dose’ mixed with feeds (or water in breast-fed infants) when required (max. 6 times in 24 hours); body-weight over 4.5 kg, 2 ‘doses’ mixed with feeds (or water in breast-fed infants) when required (max. 6 times in 24 hours); **CHILD** 2 ‘doses’ in water after each meal (max. 6 times in 24 hours)

**Note** Not to be used in preterm neonates, or where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature), or if intestinal obstruction. Not to be used with other preparations containing thickening agents.

**Important** Each half of the dual-sachet is identified as ‘one dose’.

‘To avoid errors prescribe with directions in terms of ‘dose’

**Topal®** (Fabre)

**Tablets**; alginic acid 200 mg, dried aluminium hydroxide 30 mg, light magnesium carbonate 40 mg with lactose 220 mg, sucrose 880 mg, sodium bicarbonate 40 mg (low Na+). Net price 42-tab pack = £1.67

Cautions diabetes mellitus (high sugar content)

**Indications** symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm and in diverticular disease.
### HYOSCINE BUTYLBROMIDE

**Indications**  
Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm; bowel colic and excessive respiratory secretions (see Prescribing in Palliative Care, p. 23)

**Cautions**  
See notes above

**Pregnancy**  
Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding**  
Avoid—limited information available

**Side-effects**  
Nausea; headache, dizziness; pruritus, rash; hepatitis also reported

**Dose**
- **Adult** and **Child** over 12 years, 60–120 mg 1–3 times daily

**Other antispasmodics**

Alverine, mebeverine, and peppermint oil are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in irritable bowel syndrome and diverticular disease. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus. Peppermint oil occasionally causes heartburn.

### PROPSARTHALINE HYDROCHLORIDE

**Indications**  
Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm; urinary frequency (section 7.4.2); gustatory sweating (section 6.1.5)

**Cautions**  
See notes above

**Contra-indications**  
See notes above

**Hepatic impairment**  
Manufacturer advises caution

**Renal impairment**  
Manufacturer advises caution

**Pregnancy**  
Manufacturer advises avoid unless essential

**Breast-feeding**  
May suppress lactation

**Side-effects**  
See notes above

**Dose**
- **Adult** and **Child** over 12 years, 15 mg 3 times daily at least 1 hour before meals and 30 mg at night, max. 120 mg daily

**Pro-Banthine**  
(Archimedes)

**Tablets**, pink, s/c, propantheline bromide 15 mg, net price 112-tab pack = £14.40. Label: 23

### MEBEVERINE HYDROCHLORIDE

**Indications**  
Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm; dysmenorrhoea

**Contra-indications**  
Paralytic ileus

**Pregnancy**  
Use with caution

**Breast-feeding**  
Manufacturer advises avoid—limited information available

**Side-effects**  
Nausea; headache; dizziness; pruritus, rash; hepatitis also reported

**Dose**
- **Adult** and **Child** over 12 years, 60–120 mg 1–3 times daily

**Spasmonal**  
(Norgine)

**Capsules**, alverine citrate 60 mg (blue/grey), net price 100-cap pack = £9.47; 120 mg (Spasmonal Forte, blue/grey), 60-cap pack = £10.94

### ALVERINE CITRATE

**Indications**  
Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm; dysmenorrhoea

**Contra-indications**  
Paralytic ileus

**Pregnancy**  
Use with caution

**Breast-feeding**  
Manufacturer advises avoid—limited information available

**Side-effects**  
Nausea; headache; dizziness; pruritus, rash; hepatitis also reported

**Dose**
- **Adult** and **Child** over 12 years, 60–120 mg 1–3 times daily

**Spasmonal**  
(Norgine)

**Capsules**, alverine citrate 60 mg (blue/grey), net price 100-cap pack = £9.47; 120 mg (Spasmonal Forte, blue/grey), 60-cap pack = £10.94

### MEBEVERINE HYDROCHLORIDE

**Indications**  
Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm

**Cautions**  
Avoid in acute porphyria (section 9.8.2.)

**Contra-indications**  
Paralytic ileus

**Pregnancy**  
Not known to be harmful; manufacturer advises caution

**Breast-feeding**  
May suppress lactation

**Side-effects**  
Allergic reactions (including rash, urticaria, angioedema) reported

### Compound preparations

**Kolanticon**  
(Boehringer Ingelheim)

**Gel**, sugar-free, dicycloverine hydrochloride 2.5 mg, dried aluminium hydroxide 200 mg, light magnesium oxide 100 mg, simeticone 20 mg/5 mL, net price 200 mL = £2.21, 500 mL = £3.35

**Dose**
- **Adult** and **Child** over 12 years, 10–20 mL every 4 hours when required

**Kolanticon**  
(Boehringer Ingelheim)

**Tablets**, dicycloverine hydrochloride 10 mg, net price 100-tab pack = £4.84; 20 mg (Merbentyl 20%), 84-tab pack = £8.14

**Dose**
- **Child** 2–12 years 10 mg 3 times daily
- **Over 12 years** 20 mg 4 times daily; **Infant** 6–24 months 5–10 mg 3–4 times daily, 15 minutes before feeds; **Child** 2–12 years 3 mg 3 times daily

**Merbentyl**  
(Sanofi-Aventis)

**Tablets**, dicycloverine hydrochloride 10 mg, net price 100-tab pack = £4.84; 20 mg (Merbentyl 20%), 84-tab pack = £8.14

**Dose**
- **Adult** and **Child** over 12 years, 15 mg 3 times daily at least 1 hour before meals and 30 mg at night, max. 120 mg daily

**Pro-Banthine**  
(Archimedes)

**Tablets**, pink, s/c, propantheline bromide 15 mg, net price 112-tab pack = £14.40. Label: 23

**Compound preparations**

**Kolanticon**  
(Boehringer Ingelheim)

**Gel**, sugar-free, dicycloverine hydrochloride 2.5 mg, dried aluminium hydroxide 200 mg, light magnesium oxide 100 mg, simeticone 20 mg/5 mL, net price 200 mL = £2.21, 500 mL = £3.35

**Dose**
- **Adult** and **Child** over 12 years, 10–20 mL every 4 hours when required

**Kolanticon**  
(Boehringer Ingelheim)

**Tablets**, dicycloverine hydrochloride 10 mg, net price 100-tab pack = £4.84; 20 mg (Merbentyl 20%), 84-tab pack = £8.14

**Dose**
- **Adult** and **Child** over 12 years, 15 mg 3 times daily at least 1 hour before meals and 30 mg at night, max. 120 mg daily

**Pro-Banthine**  
(Archimedes)

**Tablets**, pink, s/c, propantheline bromide 15 mg, net price 112-tab pack = £14.40. Label: 23

### Other antispasmodics

Alverine, mebeverine, and peppermint oil are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in irritable bowel syndrome and diverticular disease. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus. Peppermint oil occasionally causes heartburn.
1.3 Antisecretory drugs and mucosal protectants

**Mintec® (Almirall)**
Capsules, e/c, green/ivory, peppermint oil 0.2 mL.
Net price 84-cap pack = £7.04. Label: 5, 22, 25
Dose Adult over 18 years, 1–2 capsules swallowed whole with water, 3 times daily before meals for up to 2–3 months if necessary

**Motility stimulants**
Metoclopramide and domperidone (section 4.6) are dopamine receptor antagonists which stimulate gastric emptying and small intestinal transit, and enhance the strength of oesophageal sphincter contraction. They are used in some patients with functional dyspepsia that has not responded to a proton pump inhibitor or a H2-receptor antagonist. Metoclopramide is also used to speed the transit of barium during intestinal follow-through examination, and as accessory treatment for gastro-oesophageal reflux disease. For the management of gastroparesis in patients with diabetes, see section 6.1.5. Metoclopramide and domperidone are useful in non-specific and in cytotoxic-induced nausea and vomiting. Metoclopramide and occasionally domperidone can cause acute dystonic reactions, particularly in young women and children—for further details of this and other side-effects, see section 4.6.

**1.3 Antisecretory drugs and mucosal protectants**

### 1.3.1 H2-receptor antagonists

### 1.3.2 Selective antimuscarinics

### 1.3.3 Chelates and complexes

### 1.3.4 Prostaglandin analogues

### 1.3.5 Proton pump inhibitors

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma.

Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by *Helicobacter pylori*.

The management of *H. pylori* infection and of NSAID-associated ulcers is discussed below.

**Helicobacter pylori infection**

Eradication of *Helicobacter pylori* reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. It also causes regression of most localised gastric mucosa-associated lymphoid-tissue (MALT) lymphomas. The presence of *H. pylori* should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of *H. pylori*; reinfection is rare. Antibiotic-associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin, 

---

**Peppermint Oil**

**Indications** relief of abdominal colic and distension, particularly in irritable bowel syndrome

**Cautions** sensitivity to menthol

**Pregnancy** not known to be harmful

**Breast-feeding** significant levels of menthol in breast milk unlikely

**Side-effects** heartburn, perianal irritation; rarely, allergic reactions (including rash, headache, bradycardia, muscle tremor, ataxia)

**Local irritation** Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus

**Dose** See preparations

**Colpermin® (McNeil)**
Capsules, m/r, e/c, light blue/dark blue, blue band, peppermint oil 0.2 mL. Net price 100-cap pack = £12.05. Label: 5, 22, 25
Excipients include arachis (peanut) oil
Dose Adult over 15 years, 1–2 capsules swallowed whole with water, 3 times daily for up to 3 months if necessary
and either amoxicillin or metronidazole can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate *H. pylori* in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H2-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of *H. pylori* eradication and are not recommended.

Tinidazole is also used occasionally for *H. pylori* eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibacterials.

A two-week regimen comprising a proton pump inhibitor (e.g. omeprazole 20 mg twice daily) plus tripotassium dicitratobismuthate 120 mg four times daily, plus tetracycline 500 mg four times daily, plus metronidazole 400–500 mg three times daily can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

For the role of *H. pylori* eradication therapy in patients starting or taking a NSAID, see NSAID-associated Ulcers, below. For *H. pylori* eradication in patients with dyspepsia, see also section 1.1.

### Test for *Helicobacter pylori*

13C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of 13C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific 13C-urea breath test kit for children is available (*Helicobacter Test INFAI for children of the age 3–11*®). However, the appropriateness of testing for *H. pylori* infection in children has not been established.

#### diabact UBT® (Mod) (Infai)

| Tablets, 13C-urea 50 mg, net price 1 kit (including 1 tablet, 4 breath-sample containers, straws) = £21.25 (analysis included), 10-kit pack (hosp. only) = £74.50 (analysis not included) |
| Oral powder, 13C-urea 75 mg, net price 1 kit (including 4 breath-sample containers, straws) = £19.20 (spectrometric analysis included), 1 kit (including 2 breath bags) = £14.20 (spectrometric analysis not included), 50-test set = £855.00 (spectrometric analysis included); 45 mg (*Helicobacter Test INFAI for children of the age 3–11*®), 1 kit (including 4 breath-sample containers, straws) = £19.20 (spectrometric analysis included) |
| Pylobactell® (Torbet) (MDE) |

### NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use (section 10.1.1). The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs (see CSM advice, p. 632). Whenever possible, the NSAID should be withdrawn if an ulcer occurs.

---

**Recommended regimens for *Helicobacter pylori* eradication in adults**

Patients at high risk of developing gastro-intestinal complications with a NSAID include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal side-effects, or those with serious co-morbidity. In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H$_2$-receptor antagonist such as ranitidine given at twice the usual dose or misoprostol are alternatives. Colic and diarrhoea may limit the dose of misoprostol. A combination of a cyclo-oxygenase-2 selective inhibitor with a proton pump inhibitor may be more appropriate for those with a history of upper gastro-intestinal bleeding or 3 or more risk factors for gastro-intestinal ulceration, but see NSAIDs and Cardiovascular Events, p. 631. NSAID use and $H$. pylori infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of $H$. pylori is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are $H$. pylori positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of $H$. pylori may reduce the overall risk of ulceration.

If the NSAID can be discontinued in a patient who has developed an ulcer, a proton pump inhibitor usually produces the most rapid healing; alternatively, the ulcer can be treated with a H$_2$-receptor antagonist or misoprostol.

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events, p. 631; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastrointestinal bleeding may provide further protection against recurrence.

Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in *Helicobacter pylori* positive patients by eradication regimens (section 1.3).

H$_2$-receptor antagonists are used for the treatment of functional dyspepsia (section 1.1). H$_2$-receptor antagonists may be used for the treatment of uninvestigated dyspepsia in patients without alarm features.

H$_2$-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal) (section 1.3).

Treatment with a H$_2$-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from gastro-duodenal erosions in hepatic coma, and possibly in other conditions requiring intensive care. H$_2$-receptor antagonists also reduce the risk of acid aspiration in obstetric patients at delivery (Mendelson's syndrome).

Cautions H$_2$-receptor antagonists might mask symptoms of gastric cancer; particular care is required in patients presenting with ‘alarm features’ (see p. 43), in such cases gastric malignancy should be ruled out before treatment.

Side-effects Side-effects of the H$_2$-receptor antagonists include diarrhoea, headache, and dizziness. Rash (including erythema multiforme and toxic epidermal necrolysis) occurs less frequently. Other side-effects reported rarely or very rarely include hepatitis, cholestatic jaundice, bradycardia, psychiatric reactions (including confusion, depression, and hallucinations) particularly in the elderly or the very ill, blood disorders (including leucopenia, thrombocytopenia, and pancytopenia), arthralgia, and myalgia. Gynaecomastia and impotence occur occasionally with cimetidine and there are isolated reports with the other H$_2$-receptor antagonists.

Interactions Cimetidine retards oxidative hepatic drug metabolism by binding to microsomal cytochrome P450. It should be avoided in patients stabilised on warfarin, phenytoin, and theophylline (or aminophylline), but other interactions (see Appendix 1) may be of less clinical relevance. Famotidine, nizatidine, and ranitidine do not share the drug metabolism inhibitory properties of cimetidine.

1.3.1 H$_2$-receptor antagonists

Histamine H$_2$-receptor antagonists heal gastric and duodenal ulceration, benign gastric and duodenal ulceration, postsurgical ulceration, functional dyspepsia (section 1.1). H$_2$-receptor antagonists should not normally be used for Zollinger-Ellison syndrome because proton pump inhibitors (section 1.3.5) are more effective.
1.3.1 H₂-receptor antagonists

**Side-effects** see notes above; also malaise; less commonly tachycardia; rarely interstitial nephritis; very rarely pancreatitis, galactorrhoea, vasculitis, alopecia

**Dose**
- 400 mg twice daily (with breakfast and at night) or 800 mg at night (benign gastric and duodenal ulceration) for at least 4 weeks (6 weeks in gastric ulceration, 8 weeks in NSAID-associated ulceration); when necessary the dose may be increased to 400 mg 4 times daily; **INFANT** under 1 year 20 mg/kg daily in divided doses has been used; **CHILD** 1–12 years, 25–30 mg/kg daily in divided doses; max. 400 mg 4 times daily.
- Maintenance, 400 mg at night or 400 mg morning and night.
- Prophylaxis of stress ulceration, 200–400 mg every 4–6 hours.
- Gastric acid reduction (prophylaxis of acid aspiration; do not use syrup), obstetrics 400 mg at start of labour, then up to 400 mg every 4 hours if required (max. 2.4 g daily); surgical procedures 400 mg 90–120 minutes before induction of general anaesthesia.
- Short-bowel syndrome, 400 mg twice daily (with breakfast and at bedtime) adjusted according to response.
- To reduce degradation of pancreatic enzyme supplements, 0.8–1.6 g daily in 4 divided doses 1–1½ hours before meals.

**Famotidine** (Non-proprietary)

**Tables**, cimetidine 200 mg, net price 60-tab pack = £9.08; 400 mg, 60-tab pack = £7.61; 800 mg, 30-tab pack = £2.86.

**Oral solution**, cimetidine 200 mg/5 mL, net price 300 mL = £14.56.

**Excipients** may include propylene glycol (see Excipients, p. 2).

**Tagamet** (Chemidex)

**Tables**, all green, f/c, cimetidine 200 mg, net price 120-tab pack = £19.58; 400 mg, 60-tab pack = £22.62; 800 mg, 30-tab pack = £22.62.

**Syrup**, orange, cimetidine 200 mg/5 mL. Net price 600 mL = £28.49.

**Excipients** include propylene glycol 10% (see Excipients, p. 2).

**Nizatidine**

**Indications** see under Dose.

**Cautions** see notes above; avoid severe anemia; known or suspected aplastic anaemia; or severe or lifethreatening infection.

**Renal impairment** use normal dose every 36–48 hours or use half normal dose if eGFR less than 50 mL/minute/1.73 m²; seizures reported very rarely.

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk.

**Breast-feeding** present in milk—not known to be harmful but manufacturer advises avoid.

**Side-effects** see notes above; also constipation; less commonly dry mouth, nausea, vomiting, flatulence, taste disorders, anorexia, fatigue; very rarely chest tightness, interstitial pneumonia, seizures, paraesthesia.

**Dose**
- **Cimetidine**
  - 400 mg twice daily (with breakfast and at night)
  - **INFANT** under 1 year 20 mg/kg daily in divided doses; **CHILD** 1–12 years, 25–30 mg/kg daily in divided doses; max. 400 mg 4 times daily.

**Famotidine** (Non-proprietary)

**Tables**, famotidine 20 mg, net price 28-tab pack = £4.47; 40 mg, 28-tab pack = £5.64.

- Famotidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink including when they cause sleep disturbance (max. single dose 10 mg, max. daily dose 20 mg).

**Pepcid** (MSD)

**Tables**, f/c, famotidine 20 mg (beige), net price 28-tab pack = £13.37; 40 mg (brown), 28-tab pack = £25.40

**Famotidine**

**Indications** see under Dose.

**Cautions** see notes above; also avoid rapid intravenous injection (risk of arrhythmias and postural hypotension); **interactions:** Appendix 1 (histamine H₂-antagonists) and notes above.

**Hepatic impairment** manufacturer advises caution.

**Renal impairment** use half normal dose if eGFR 20–50 mL/minute/1.73 m²; use one-quarter normal dose if eGFR less than 20 mL/minute/1.73 m².

**Pregnancy** manufacturer advises avoid unless essential.

**Breast-feeding** amount too small to be harmful.

**Side-effects** see notes above; also sweating; rarely nausea, fever, vasculitis, hyperuricaemia.

**Dose**
- **By mouth**, benign gastric, duodenal or NSAID-associated ulceration, treatment, 300 mg in the evening or 150 mg twice daily for 4–8 weeks; maintenance, 150 mg at night.
- **Gastro-oesophageal reflux disease**, 150–300 mg twice daily for up to 12 weeks.
- **By intravenous infusion**, for short-term use in peptic ulcer as alternative to oral route (for hospital inpatients), by intermittent intravenous infusion over 15 minutes, 100 mg 3 times daily, or by continuous intravenous infusion, 10 mg/hour; max. 480 mg daily.
- **CHILD** not recommended.

**Nizatidine** (Non-proprietary)

**Capsules**, nizatidine 150 mg, net price 30-cap pack = £12.04; 300 mg, 30-cap pack = £14.28.

- Nizatidine can be sold to the public for the prevention and treatment of symptoms of food-related heartburn and meal-induced indigestion in adults and children over 16 years: max. single dose 75 mg, max. daily dose 150 mg for max. 14 days.

**Axid** (Flynn)

**Capsules**, nizatidine 150 mg (pale yellow/dark yellow), net price 28-cap pack (hosp. only) = £6.87; 30-cap pack = £7.97; 300 mg (pale yellow/brown), 30-cap pack = £15.80.

**Injection**, nizatidine 25 mg/mL. For dilution and use as an intravenous infusion. Net price 4-mL amp = £1.14.
RANITIDINE

Indications see under Dose, other conditions where reduction of gastric acidity is beneficial (see notes above and section 1.9.4)

Cautions see notes above; also acute porphyria; see Appendix 1 (histamine H2-antagonists) and notes above

Renal impairment use half normal dose if eGFR less than 50 mL/minute/1.73 m2

Pregnancy manufacturer advises avoid unless essential

Breast-feeding significant amount present in milk, but not known to be harmful

Side-effects see notes above; less commonly blurred vision; also reported pancreatitis, involuntary movement disorders, interstitial nephritis, alopecia

Dose

- By mouth, benign gastric and duodenal ulceration, chronic episodic dyspepsia, ADULT and CHILD over 12 years, 150 mg twice daily or 300 mg at night for 4–8 weeks in benign gastric and duodenal ulceration, up to 6 weeks in chronic episodic dyspepsia, and up to 8 weeks in NSAID-associated ulceration (in duodenal ulcer 300 mg can be given twice daily for 4 weeks to achieve a higher healing rate); CHILD 3–12 years, (benign gastric and duodenal ulceration) 2–4 mg/kg (max. 150 mg) twice daily for 4–8 weeks

- Prophylaxis of NSAID-associated gastric or duodenal ulcer [unlicensed dose], ADULT and CHILD over 12 years, 300 mg twice daily

- Gastro-oesophageal reflux disease, ADULT and CHILD over 12 years, 150 mg twice daily or 300 mg at night for up to 8 weeks or if necessary 12 weeks (moderate to severe, 600 mg daily in 2–4 divided doses for up to 12 weeks); long-term treatment of healed gastro-oesophageal reflux disease, 150 mg twice daily; CHILD 3–12 years, 2.5–5 mg/kg (max. 300 mg) twice daily

- Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics, ADULT and CHILD over 12 years, by mouth, 150 mg at onset of labour, then every 6 hours; surgical procedures, by intramuscular or slow intravenous injection, 50 mg 45–60 minutes before induction of anaesthesia (intravenous injection diluted to 20 mL and given over at least 2 minutes), or by mouth, 150 mg 2 hours before induction of anaesthesia and also when possible on the preceding evening

- By intramuscular injection, 50 mg every 6–8 hours

- By slow intravenous injection, ADULT and CHILD over 12 years, 50 mg diluted to 20 mL and given over at least 2 minutes; may be repeated every 6–8 hours

- Prophylaxis of stress ulceration [unlicensed dose], ADULT and CHILD over 12 years, by slow intravenous injection over at least 2 minutes, 50 mg diluted to 20 mL every 8 hours (may be changed to 150 mg twice daily by mouth when oral feeding commences)

Ranitidine (Non-proprietary) Tablets, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £1.97; 300 mg, 30-tab pack = £2.17

Brands include Zantac®

Effervescent tablets, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £18.04; 300 mg, 30-tab pack = £17.03. Label: 13

Excipients may include sodium (check with supplier)

1.3.2 Selective antimuscarinics

Oral solution, ranitidine (as hydrochloride) 75 mg/5 mL, net price 100 mL = £7.44, 300 mL = £19.61

Excipients may include alcohol (check with supplier)

Note Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg)

Injection, ranitidine (as hydrochloride) 25 mg/mL, net price 2-mL amp = 54p

Zantac® (GSK) Tablets, f/c, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £1.30; 300 mg, 30-tab pack = £1.30

Syrup, sugar-free, ranitidine (as hydrochloride) 75 mg/5 mL, net price 300 mL = £20.76

Excipients include alcohol 8%

Injection, ranitidine (as hydrochloride) 25 mg/mL, net price 2-mL amp = 57p

1.3.3 Chelates and complexes

Tripotassium dicitratobismuthate is a bismuth chelate effective in healing gastric and duodenal ulcers. For the role of tripotassium dicitratobismuthate in a Helicobacter pylori eradication regimen for those who have not responded to first-line regimens, see section 1.3.

The bismuth content of tripotassium dicitratobismuthate is low but absorption has been reported; encephalopathy (described with older high-dose bismuth preparations) has not been reported.

Sucralfate may act by protecting the mucosa from pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulphated sucrose but has minimal antiacid properties. It should be used with caution in patients under intensive care (important: reports of bezoar formation, see Bezoar Formation below)

TRIPOTASSIUM DICTRATOBISMUTHATE

Indications benign gastric and duodenal ulceration; see also Helicobacter pylori infection, section 1.3

Cautions see notes above; interactions: Appendix 1 (tripotassium dicitratobismuthate)

Renal impairment avoid in severe impairment

Pregnancy manufacturer advises avoid on theoretical grounds

Breast-feeding no information available

Side-effects may darken tongue and blacken faeces; less commonly nausea, vomiting, diarrhoea, constipation, rash, and pruritus reported
Misoprostol, a synthetic prostaglandin analogue has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers. It can prevent NSAID-associated ulcers, its use being most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn.

For comment on the use of misoprostol to induce abortion or labour [unlicensed indications], see section 7.1.1.

**MISOPROSTOL**

**Indications** see notes above and under Dose

**Cautions** conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease)

**Contra-indications** planning pregnancy [important: see Women of Childbearing Age, and also Pregnancy, below]

Women of childbearing age Manufacturer advises that misoprostol should not be used in women of childbearing age unless the patient requires non-steroidal anti-inflammatory (NSAID) therapy and is at high risk of complications from NSAID-induced ulceration. In such patients it is advised that misoprostol should only be used if the patient takes effective contraceptive measures and has been advised of the risks of taking misoprostol if pregnant.

**Pregnancy** avoid—potent uterine stimulant (has been used to induce abortion) and may be teratogenic; important: see also Women of Childbearing Age, above

**Breast-feeding** no information available—manufacturer advises avoid

**Side-effects** diarrhoea (may occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids); also reported: abdominal pain, dyspepsia, flatulence, nausea and vomiting, abnormal vaginal bleeding (including intermenstrual bleeding, menorrhagia, and postmenopausal bleeding), rashes, dizziness

**Dose**

- **Benign gastric and duodenal ulceration and NSAID-associated ulceration, ADULT over 18 years, 800 micrograms daily (in 2–4 divided doses) with breakfast (or main meals) and at bedtime; treatment should be continued for at least 4 weeks and may be continued for up to 8 weeks if required**

- **Prophylaxis of NSAID-induced gastric and duodenal ulcer, ADULT over 18 years, 200 micrograms 4 times daily (if not tolerated, reduced to 200 micrograms 2–3 times daily, but less effective)**

**Cytotec®** (Pharmacia) Tablets, scored, misoprostol 200 micrograms, net price 60-tab pack = £10.03. Label: 21

With diclofenac or naproxen

Section 10.1.1

**1.3.4 Prostaglandin analogues**

**De-Noltab®** (Astellas) Tablets, f/c, tripotassium dicitratobismuthate 120 mg, net price 112-tab pack = £5.09. Counselling, see below Electrolytes K+ 2 mmol/tablet

Dose 2 tablets twice daily or 1 tablet 4 times daily; taken for 28 days followed by further 28 days if necessary; maintenance not indicated but course may be repeated after interval of 1 month; CHILD not recommended

Counselling To be swallowed with half a glass of water; twice-daily dosage to be taken 30 minutes before breakfast and main evening meal; four-times-daily dosage to be taken as follows: one dose 30 minutes before breakfast, midday meal and main evening meal, and one dose 2 hours after main evening meal; milk should not be drunk by itself during treatment but small quantities may be taken in tea or coffee or on cereal; antacids, fruit, or fruit juice should not be taken half an hour before or after a dose; may darken tongue and blacken faces

**Sucralfate**

**Indications** see under Dose

**Cautions** administration of sucralfate and enteral feeds should be separated by 1 hour; interactions: Appendix 1 (sucralfate)

**Bezoar formation** Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying

**Renal impairment** use with caution; aluminium is absorbed and may accumulate

**Pregnancy** no evidence of harm; absorption from gastro-intestinal tract negligible

**Breast-feeding** amount probably too small to be harmful

**Side-effects** constipation; less frequently diarrhoea, nausea, indigestion, flatulence, gastric discomfort, back pain, dizziness, headache, drowsiness, bezoar formation (see above), dry mouth and rash

**Dose**

- **Benign gastric and duodenal ulceration and chronic gastritis, ADULT and CHILD over 15 years, 2 g twice daily (on rising and at bedtime) or 1 g 4 times daily 1 hour before meals and at bedtime, taken for 4–6 weeks or in resistant cases up to 12 weeks; max. 8 g daily**

- **Prophylaxis of stress ulceration, ADULT and CHILD over 15 years, 1 g 6 times daily; max. 8 g daily**

- **CHILD under 15 years see BNF for Children**

**Antepsin®** (Chugai) Tablets, scored, sucralfate 1 g, net price 50-tab pack = £5.77. Label: 5

**Note** Crushed tablets may be dispersed in water

**Suspension**, sucralfate, 1 g/5 mL, net price 250 mL (aniseed- and caramel-flavoured) = £5.77. Label: 5

**1.3.5 Proton pump inhibitors**

Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell. Proton pump inhibitors are effective short-term treatments for gastric and duodenal ulcers; they are also used in combination with antibacterials for the eradication of Helicobacter pylori (see p. 50 for specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery. Proton pump inhibitors can be used for the treatment of dyspepsia and gastro-oesophageal reflux disease (section 1.1).

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers (see p. 50). In patients who need to continue NSAID treatment after an
ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur.

A proton pump inhibitor can be used to reduce the degradation of pancreatic enzyme supplements (section 1.9.4) in patients with cystic fibrosis. They can also be used to control excessive secretion of gastric acid in Zollinger–Ellison syndrome; high doses are often required.

**Cautions** Proton pump inhibitors may mask the symptoms of gastric cancer; particular care is required in such situations; gastric malignancy should be ruled out before treatment.

**Side-effects** Side-effects of the proton pump inhibitors include gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, flatulence, diarrhoea, constipation), and headache. Less frequent side-effects include dry mouth, peripheral oedema, dizziness, sleep disturbances, fatigue, paraesthesia, arthralgia, myalgia, rash, and pruritus. Other side-effects reported rarely or very rarely include taste disturbance, stomatitis, hepatitis, jaundice, hypersensitivity reactions (including anaphylaxis, bronchospasm), fever, depression, hallucinations, confusion, gynaecomastia, interstitial nephritis, hyponatraemia, blood disorders (including leucopenia, leucocytosis, pancytopenia, thrombocytopenia), visual disturbances, sweating, photosensitivity, alopecia, Stevens-Johnson syndrome, and toxic epidermal necrolysis. By decreasing gastric acidity, proton pump inhibitors may increase the risk of gastro-intestinal infections (including *Clostridium difficile* infection).

**ESOMEPRAZOLE**

**Indications** see under Dose

**Cautions** see notes above; **interactions:** Appendix 1 (proton pump inhibitors)

**Hepatic impairment** in severe hepatic impairment max. 20 mg daily (ADULT 1–12 years max. 10 mg daily); for severe peptic ulcer bleeding in severe hepatic impairment, initial intravenous infusion of 80 mg, then by continuous intravenous infusion, 4 mg/hour for 72 hours

**Renal impairment** manufacturer advises caution in severe renal insufficiency

**Pregnancy** manufacturer advises caution—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above

**Dose**

- **By mouth**
  - Duodenal ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 50
  - NSAID-associated gastric ulcer, **ADULT** over 18 years, 20 mg once daily for 4–8 weeks; prophylaxis in patients with an increased risk of gastrointestinal complications who require continued NSAID treatment, 20 mg daily
  - Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis), **ADULT** and **CHILD** over 12 years, 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily; **CHILD** 1–12 years, body-weight 10–20 kg, 10 mg once daily for 8 weeks; body-weight over 20 kg, 10–20 mg once daily for 8 weeks

**BNF 61 1.3.5 Proton pump inhibitors 55**

Symptomatic treatment of gastro-oesophageal reflux disease (in the absence of oesophagitis), **ADULT** and **CHILD** over 12 years, 20 mg once daily for up to 4 weeks, then 20 mg daily when required; **CHILD** 1–12 years, body-weight over 10 kg, 10 mg once daily for up to 8 weeks

Zollinger–Ellison syndrome, **ADULT** over 18 years, initially 40 mg twice daily, adjusted according to response; usual range 80–160 mg daily (above 80 mg in 2 divided doses)

- By **intravenous injection** over at least 3 minutes or by **intravenous infusion**, **ADULT** over 18 years, gastro-oesophageal reflux disease, 40 mg once daily; symptomatic reflux disease without oesophagitis, treatment of NSAID-associated gastric ulcer, prevention of NSAID-associated gastric or duodenal ulcer, 20 mg daily; continue until oral administration possible

- Severe peptic ulcer bleeding (following endoscopic treatment), **ADULT** over 18 years, initial **intravenous infusion** of 80 mg over 30 minutes, then by continual **intravenous infusion** 8 mg/hour for 72 hours, then by **mouth** 40 mg once daily for 4 weeks

**Nexium®** (AstraZeneca) (HF)

**Tablets**

- f/c, esomeprazole (as magnesium trihydrate) 20 mg (light pink), net price 28-tab pack = £18.50; 40 mg (pink), 28-tab pack = £25.19. Counselling, administration

- **Counselling** Do not chew or crush tablets, swallow whole or disperse in water

**Granules**

- yellow, e/c, esomeprazole (as magnesium trihydrate) 10 mg/sachet, net price 28-sachet pack = £25.19. Label: 25, counselling, administration

- **Counselling** Disperse the contents of each sachet in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose; can be administered through nasogastric or gastric tube

**Injection** powder for reconstitution, esomeprazole (as sodium salt), net price 40-mg vial = £3.13

- **With naproxen**

  Section 10.1.1

**LANSPROZOLE**

**Indications** see under Dose

**Cautions** see notes above; **interactions:** Appendix 1 (proton pump inhibitors)

**Hepatic impairment** use half normal dose in moderate to severe liver disease

**Pregnancy** manufacturer advises avoid

**Breast-feeding** avoid unless essential—present in milk in animal studies

**Side-effects** see notes above; also glossitis, pancreatitis, anorexia, restlessless, tremor, impotence, petechiae, and purpura; very rarely colitis, raised serum cholesterol or triglycerides

**Dose**

- Benign gastric ulcer, 30 mg daily in the morning for 8 weeks

- Duodenal ulcer, 30 mg daily in the morning for 4 weeks; maintenance 15 mg daily

- NSAID-associated duodenal or gastric ulcer, 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; prophylaxis, 15–30 mg once daily

- Eradication of *Helicobacter pylori* associated with duodenal ulcer or ulcer-like dyspepsia, see eradication regimens on p. 50
1.3.5 Proton pump inhibitors

- Zollinger-Ellison syndrome (and other hypersecretory conditions), initially 60 mg once daily adjusted according to response; daily doses of 120 mg or more given in two divided doses
- Gastro-oesophageal reflux disease, 30 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 15–30 mg daily
- Acid-related dyspepsia, 15–30 mg daily in the morning for 4–8 weeks
- CHILD under 18 years see BNF for Children

Note Lansoprazole doses in BNF may differ from those in product literature

Lansoprazole (Non-proprietary) *(P)*

Capsules, enclosing e/c granules, lansoprazole 15 mg, net price 28-cap pack = £1.44; 30 mg, 28-cap pack = £2.23. Label: 5, 22, 25

Dental prescribing on NHS Lansoprazole capsules may be prescribed

Zoton® *(Wyeth)* *(P)*

Capsules, enclosing e/c granules, lansoprazole 15 mg, net price 28-cap pack = £2.99; 30 mg, 28-tab pack = £5.50. Label: 5, 22, counselling, administration Excipients include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube

OMEPRAZOLE

Indications see under Dose

Cautions see notes above; Interactions: Appendix 1 (proton pump inhibitors)

Hepatic impairment not more than 20 mg daily should be needed

Pregnancy not known to be harmful

Breast-feeding present in milk but not known to be harmful

Side-effects see notes above; also agitation and impotence

Dose
- By mouth, benign gastric and duodenal ulcers, 20 mg once daily for 4 weeks in duodenal ulceration or 8 weeks in gastric ulceration; in severe or recurrent cases increase to 40 mg daily; maintenance for recurrent duodenal ulcer, 20 mg once daily; prevention of relapse in duodenal ulcer, 10 mg daily increasing to 20 mg once daily if symptoms return NSAIĐ-associated duodenal or gastric ulcer and gastroduodenal erosions, 20 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; prophylaxis in patients with a history of NSAIĐ-associated duodenal or gastric ulcers, gastroduodenal lesions, or dyspeptic symptoms who require continued NSAIĐ treatment, 20 mg once daily
- Duodenal or benign gastric ulcer associated with Helicobacter pylori, see eradication regimens on p. 50
- Zollinger–Ellison syndrome, initially 60 mg once daily; usual range 20–120 mg daily (above 80 mg in 2 divided doses)
- Gastric acid reduction during general anaesthesia (prophylaxis of acid aspiration), 40 mg on the preceding evening then 40 mg 2–6 hours before surgery
- Gastro-oesophageal reflux disease, 20 mg once daily for 4 weeks, continued for further 4–8 weeks if not fully healed; 40 mg once daily has been given for 8 weeks in gastro-oesophageal reflux disease refractory to other treatment; maintenance 20 mg once daily

Acid reflux disease (long-term management), 10 mg daily increasing to 20 mg once daily if symptoms return
- Acid-related dyspepsia, 10–20 mg once daily for 2–4 weeks according to response
- Severe ulcerating reflux oesophagitis, CHILD over 1 year, body-weight 10–20 kg, 10 mg once daily increased if necessary to 20 mg once daily for 4–12 weeks; body-weight over 20 kg, 20 mg once daily increased if necessary to 40 mg once daily for 4–12 weeks; to be initiated by hospital paediatrician
- By intravenous injection over 5 minutes or by intravenous infusion over 20–30 minutes, prophylaxis of acid aspiration, 40 mg completed 1 hour before surgery
- Benign gastric ulcer, duodenal ulcer and gastro-oesophageal reflux, 40 mg once daily until oral administration possible
- Major peptic ulcer bleeding (following endoscopic treatment) [unlicensed indication], initial intravenous infusion of 80 mg over 40–60 minutes, then by continuous intravenous infusion, 8 mg/hour for 72 hours (then change to oral therapy)

Counselling Swallow whole, or disperse MUPS® tablets in water, or mix capsule contents or MUPS® tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should not be opened

Omeprazole (Non-proprietary) *(P)*

Capsules, enclosing e/c granules, omeprazole 10 mg, net price 28-cap pack = £1.81; 20 mg, 28-cap pack = £1.92; 40 mg, 7-cap pack = £1.95, 28-cap pack = £21.65. Counselling, administration

Capsules, enclosing e/c tablet, omeprazole 10 mg, net price 28-cap pack = £1.81; 20 mg, 28-cap pack = £1.92. Counselling, administration

Brands include Mepradec®

Dental prescribing on NHS Gastro-resistant omeprazole capsules may be prescribed

1. Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets

Losec® *(AstraZeneca)* *(P)*

MUPS® (multiple-unit pellet system = dispersible tablets), f/c, omeprazole 10 mg (light pink), net price 28-tab pack = £7.75; 20 mg (pink), 28-tab pack = £11.60; 40 mg (red-brown), 7-tab pack = £5.80. Counselling, administration

Capsules, enclosing e/c granules, omeprazole 10 mg (pink), net price 28-cap pack = £7.75; 20 mg (pink/brown), 28-cap pack = £11.60; 40 mg (brown), 7-cap pack = £5.80. Counselling, administration

Intravenous infusion, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial = £5.18

With ketoprofen

Section 10.1.1
**PANTOPRAZOLE**

**Indications** see under Dose

**Cautions** see notes above; **interactions:** Appendix 1 (proton pump inhibitors)

**Hepatic impairment** max. 20 mg daily in severe impairment and cirrhosis—monitor liver function (discontinue if deterioration)

**Renal impairment** max. oral dose 40 mg daily

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—fetal toxic in **animals**

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—small amount present in milk in **animal** studies

**Side-effects** see notes above; also hyperlipidaemia, weight changes

**Dose**

- By mouth, benign gastric ulcer, **ADULT** over 18 years, 40–80 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed
- Gastro-oesophageal reflux disease, **ADULT** and **CHILD** over 12 years, 20–80 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 20 mg daily, increased to 40 mg daily if symptoms return
- Duodenal ulcer, **ADULT** over 18 years, 40–80 mg daily in the morning for 2 weeks, continued for further 2 weeks if not fully healed
- Duodenal ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 50
- Prophylaxis of NSAID-associated gastric or duodenal ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment, **ADULT** over 18 years, 20 mg daily
- Zollinger–Ellison syndrome (and other hypersecretory conditions), **ADULT** over 18 years, initially 80 mg once daily adjusted according to response (ELDERLY max. 40 mg daily); daily doses above 80 mg given in 2 divided doses
- By intravenous **injection** over at least 2 minutes or by intravenous **infusion**, **ADULT** over 18 years, duodenal ulcer, gastric ulcer, and gastro-oesophageal reflux, 40 mg daily until oral administration can be resumed
- Zollinger–Ellison syndrome (and other hypersecretory conditions), **ADULT** over 18 years, initially 80 mg (160 mg if rapid acid control required) then 80 mg once daily adjusted according to response; daily doses above 80 mg given in 2 divided doses

**Pantoprazole** (Non-proprietary)

Tables, e/c, pantoprazole 20 mg, net price 28-tab pack = £1.79; 40 mg, 28-tab pack = £2.82. Label: 25

**Note** Pantoprazole 20 mg tablets can be sold to the public for the short-term treatment of reflux symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks

**Protiul**® (Nycomed)

**Injection**, powder for reconstitution, pantoprazole (as sodium salt), net price 40-mg vial = £5.11

**RABEPRAZOLE SODIUM**

**Indications** see under Dose

**Cautions** see notes above; **interactions:** Appendix 1 (proton pump inhibitors)

**Hepatic impairment** manufacturer advises caution in severe hepatic dysfunction

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also cough, influenza-like syndrome, and rhinitis; less commonly chest pain and nervousness; rarely anorexia and weight gain

**Dose**

- Benign gastric ulcer, 20 mg daily in the morning for 6 weeks, continued for further 6 weeks if not fully healed
- Duodenal ulcer, 20 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed
- Gastro-oesophageal reflux disease, 20 mg once daily for 4–8 weeks; maintenance 10–20 mg daily; symptomatic treatment in the absence of esophagitis, 10 mg daily for up to 4 weeks, then 10 mg daily when required
- Duodenal and benign gastric ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 50
- Zollinger–Ellison syndrome, initially 60 mg once daily adjusted according to response (max. 120 mg daily); doses above 100 mg daily given in 2 divided doses
- **CHILD** not recommended

**Pariet**® (Janssen-Cilag, Eisai)

Tablets, e/c, rabeprazole sodium 10 mg (pink), net price 28-tab pack = £11.56; 20 mg (yellow), 28-tab pack = £19.55. Label: 25

## 1.4 Acute diarrhoea

### 1.4.1 Adsorbents and bulk-forming drugs

### 1.4.2 Antimotility drugs

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion. This is particularly important in infants and in frail and elderly patients. For details of oral rehydration preparations, see section 9.2.1.2. Severe depletion of fluid and electrolytes requires immediate admission to hospital and urgent replacement.

**Antimotility drugs** (section 1.4.2) relieve symptoms of acute diarrhoea. They are used in the management of uncomplicated acute diarrhoea in adults; fluid and electrolyte replacement may be necessary in case of dehydration. However, antimotility drugs are not recommended for acute diarrhoea in young children. Antispasmodics (section 1.2) are occasionally of value in treating abdominal cramp associated with diarrhoea but they should not be used for primary treatment. Antispasmodics and antiemetics should be avoided in young children with gastro-enteritis because they are rarely effective and have troublesome side-effects. Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without them, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment; for drugs used in campylobacter enteritis, shigellosis, and salmonellosis, see Table 1, section 5.1. *Ciprofloxacin* is occasionally used for prophylaxis against travellers’ diarrhoea, but routine use is not recommended. Lactobacillus preparations have not been shown to be effective.

Co-phenotrope (Non-proprietary)

Tablets, co-phenotrope 2.5/0.025 (diphenoxylate hydrochloride 2.5 mg, atropine sulphate 25 micrograms), net price 100 = £8.95

Brands include Lomotil®

Dose

initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled; CHILD under 4 years see BNF for Children; 4–9 years 1 tablet 3 times daily, 9–12 years 1 tablet 4 times daily, 12–16 years 2 tablets 3 times daily, but see also notes above

Note

Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets)

CO-PHENOTROPE

A mixture of diphenoxylate hydrochloride and atropine sulphate in the mass proportions 100 parts to 1 part respectively

Indications

adjunct to rehydration in acute diarrhoea (but see notes above); control of faecal consistency after colostomy or ileostomy (section 1.8)

Cautions

section 4.7.2; also young children are particularly susceptible to overdosage and symptoms may be delayed and observation is needed for at least 48 hours after ingestion; presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage (section 1.2); interactions: Appendix 1 (antimuscarinics, opioid analgesics)

Contra-indications

section 4.7.2 and also see under Antimuscarinics (section 1.2)

Hepatic impairment

section 4.7.2; also avoid in jaundice

Co-phenotrope (Non-proprietary)

Tablets, co-phenotrope 2.5/0.025 (diphenoxylate hydrochloride 2.5 mg, atropine sulphate 25 micrograms), net price 100 = £8.95

Brands include Lomotil®

Dose

initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled; CHILD under 4 years see BNF for Children; 4–9 years 1 tablet 3 times daily, 9–12 years 1 tablet 4 times daily, 12–16 years 2 tablets 3 times daily, but see also notes above

Note

Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets)

LOPERAMIDE HYDROCHLORIDE

Indications

symptomatic treatment of acute diarrhoea; adjunct to rehydration in acute diarrhoea in adults and children over 4 years (but see notes above); chronic diarrhoea in adults only

Cautions

see notes above; interactions: Appendix 1 (loperamide)

Contra-indications

conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in acute diarrhoeal conditions such as acute ulcerative colitis or antibiotic-associated colitis

Hepatic impairment

risk of accumulation—manufacturer advises caution

Pregnancy

manufacturers advise avoid—no information available

Breast-feeding

amount probably too small to be harmful

Side-effects

abdominal cramps, dizziness, drowsiness, and skin reactions including urticaria; paralytic ileus and abdominal bloating also reported

Dose

● Acute diarrhoea, 4 mg initially followed by 2 mg after each loose stool for up to 5 days; usual dose 6–8 mg daily; max. 16 mg daily; CHILD under 4 years not

LoPeraMide Hydrochloride

Indications

symptomatic treatment of acute diarrhoea; adjunct to rehydration in acute diarrhoea in adults and children over 4 years (but see notes above); chronic diarrhoea in adults only

Cautions

see notes above; interactions: Appendix 1 (loperamide)

Contra-indications

conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in conditions such as active ulcerative colitis or antibiotic-associated colitis

Hepatic impairment

risk of accumulation—manufacturer advises caution

Pregnancy

manufacturers advise avoid—no information available

Breast-feeding

amount probably too small to be harmful

Side-effects

abdominal cramps, dizziness, drowsiness, and skin reactions including urticaria; paralytic ileus and abdominal bloating also reported

Dose

● Acute diarrhoea, 4 mg initially followed by 2 mg after each loose stool for up to 5 days; usual dose 6–8 mg daily; max. 16 mg daily; CHILD under 4 years not

Loperamide Hydrochloride

Indications

symptomatic treatment of acute diarrhoea; adjunct to rehydration in acute diarrhoea in adults and children over 4 years (but see notes above); chronic diarrhoea in adults only

Cautions

see notes above; interactions: Appendix 1 (loperamide)

Contra-indications

conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in conditions such as active ulcerative colitis or antibiotic-associated colitis

Hepatic impairment

risk of accumulation—manufacturer advises caution

Pregnancy

manufacturers advise avoid—no information available

Breast-feeding

amount probably too small to be harmful

Side-effects

abdominal cramps, dizziness, drowsiness, and skin reactions including urticaria; paralytic ileus and abdominal bloating also reported

Dose

● Acute diarrhoea, 4 mg initially followed by 2 mg after each loose stool for up to 5 days; usual dose 6–8 mg daily; max. 16 mg daily; CHILD under 4 years not
Loperamide (Non-proprietary) 

Capsules, loperamide hydrochloride 2 mg, net price 30-cap pack = £1.07

Tablets, loperamide hydrochloride 2 mg, net price 30-tab pack = £2.15

Brands include Normode®

Note Loperamide can be sold to the public, provided it is licensed and labelled for the treatment of acute diarrhoea in adults and children over 12 years of age, or for acute diarrhoea associated with irritable bowel syndrome (after initial diagnosis by a doctor) in adults and labelled for the treatment of acute diarrhoea in adults and children over 12 years of age, or for acute diarrhoea associated with irritable bowel syndrome (after initial diagnosis by a doctor) in adults and children over 12 years of age.

Imodium® (Janssen-Cilag) 

Capsules, green/grey, loperamide hydrochloride 2 mg. Net price 30-cap pack = £1.09

Syrup, sugar free, red, loperamide hydrochloride 1 mg/5 mL. Net price 100 mL = £1.17

Compound preparations

Imodium® Plus (McNeil)

Caplets (= tablets), loperamide hydrochloride 2 mg, simeticone 125 mg, net price 6-tab pack = £2.27, 12-tab pack = £3.58

Dose acute diarrhoea with abdominal colic, initially 2 caplets (CHILD 12–18 years 1 caplet) then 1 caplet after each loose stool; max. 4 caplets daily for up to 2 days. CHILD under 12 years not recommended

Breast-feeding see notes above and under Morphine Salts (section 4.7.2)

Contra-indications see notes above and under Morphine Salts (section 4.7.2)

Hepatic impairment section 4.7.2

Renal impairment section 4.7.2

Pregnancy section 4.7.2

Breast-feeding see under Morphine Salts (section 4.7.2)

Side-effects see notes above and under Morphine Salts (section 4.7.2); sedation and the risk of dependence are greater

Dose

• See preparation

Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension)

Oral suspension, light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 mL

Dose ADULT and CHILD over 12 years, 10 mL every 6 hours in water

MORPHINE

Indications see notes above; cough in terminal disease (section 3.9.1); pain (section 4.7.2)

Cautions see notes above and under Morphine Salts (section 4.7.2)

Contra-indications see notes above and under Morphine Salts (section 4.7.2)

Hepatic impairment section 4.7.2

Renal impairment section 4.7.2

Pregnancy section 4.7.2

Breast-feeding see under Morphine Salts (section 4.7.2)

Side-effects see notes above and under Morphine Salts (section 4.7.2); sedation and the risk of dependence are greater

Dose

• See preparation

Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension)

Oral suspension, light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 mL

Dose ADULT and CHILD over 12 years, 10 mL every 6 hours in water

Inflammatory bowel disease

Chronic inflammatory bowel diseases include ulcerative colitis and Crohn’s disease. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.

Aminosalicylates (balsalazide, mesalazine, olsalazine, and sulfasalazine), corticosteroids (hydrocortisone, beclometasone, budesonide, and prednisolone), and drugs that affect the immune response are used in the treatment of inflammatory bowel disease.

Treatment of acute ulcerative colitis and Crohn’s disease

Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid is treated initially with local application of an aminosalicylate (section 1.5.1); alternatively, a local corticosteroid can be used but it is less effective. A combination of a local aminosalicylate and a local corticosteroid can be used for proctitis that does not respond to a local aminosalicylate alone. Foam preparations and suppositories are especially useful when patients have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the proximal colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate can be used in proctitis or distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as prednisolone (section 1.5.2) for 4–8 weeks. Modified-release budesonide is licensed for Crohn’s disease affecting the ileum and the ascending colon; it causes fewer systemic side-effects than oral prednisolone but may be less effective. Beclometasone dipropionate by mouth is licensed as an adjunct to mesalazine for mild to moderate ulcerative colitis, but it is not known whether it is as effective as other corticosteroids.

Severe inflammatory bowel disease or disease that is not responding to an oral corticosteroid requires hospital admission and treatment with an intravenous corticosteroid (such as hydrocortisone or methylprednisolone, section 6.3.2); other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Specialist supervision is required for patients who fail to respond adequately to these measures. Patients with severe ulcerative colitis that has not responded to intravenous corticosteroids, may benefit from a short course of intravenous ciclosporin [unlicensed indication] (section 1.5.3). Patients with unresponsive or chronically active Crohn’s disease may benefit from azathioprine (section 1.5.3), mercaptopurine (section 1.5.3), or once-weekly methotrexate (section 1.5.3) [all unlicensed indications]; these drugs have a slower onset of action.

Infliximab (section 1.5.3) is licensed for the management of severe active Crohn’s disease and severe ulcerative colitis in patients whose condition has not
responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them.

NICE guidance
Infliximab and adalimumab for Crohn’s disease (May 2010)
Infliximab or adalimumab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contraindications; infliximab can also be used in a similar way in children over 6 years of age. In adults over 18 years of age, infliximab is recommended for the treatment of fistulating Crohn’s disease that has not responded to conventional therapy (including antibacterials, drainage, and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contraindications. Infliximab or adalimumab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, adalimumab or infliximab can be restarted (but see Hypersensitivity Reactions under Infliximab, p. 66).

NICE guidance
Infliximab for subacute manifestations of ulcerative colitis (April 2008)
Infliximab is not recommended for the treatment of subacute manifestations of moderate to severe active ulcerative colitis that would normally be managed in an outpatient setting.

Adalimumab (section 1.5.3) is licensed for the treatment of severe active Crohn’s disease in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them. For inducing remission, adalimumab should be used in combination with a corticosteroid, but it may be given alone if a corticosteroid is inappropriate or is not tolerated. Adalimumab may also be used for Crohn’s disease in patients who have relapsed while taking infliximab or who cannot tolerate infliximab because of hypersensitivity reactions.

Maintenance of remission of acute ulcerative colitis and Crohn’s disease
Smoking cessation (section 4.10.2) reduces the risk of relapse in Crohn’s disease and should be encouraged. Aminosalicylates are efficacious in the maintenance of remission of ulcerative colitis, but there is no evidence of efficacy in the maintenance of remission of Crohn’s disease. Corticosteroids are not suitable for maintenance treatment because of their side-effects. In resistant or frequently relapsing cases either azathioprine (section 1.5.3) [unlicensed indication] or mercaptopurine (section 1.5.3) [unlicensed indication], given under close supervision may be helpful. Methotrexate (section 1.5.3) is tried in Crohn’s disease if azathioprine or mercaptopurine cannot be used [unlicensed indication]. Maintenance therapy with infliximab should be considered for patients with Crohn’s disease or ulcerative colitis who respond to the initial induction course of infliximab; fixed-interval dosing is superior to intermittent dosing. Adalimumab is licensed for maintenance therapy in Crohn’s disease.

Fistulating Crohn’s disease
Treatment may not be necessary for simple, asymptomatic perianal fistulas. Metronidazole (section 5.1.11) or ciprofloxacin (section 5.1.12) can improve symptoms of fistulating Crohn’s disease but complete healing occurs rarely [unlicensed indication]. Metronidazole by mouth is used at a dose of 10–20 mg/kg daily in divided doses (usual dose 500 mg 3 times daily); it is usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy. Ciprofloxacin by mouth is given at a dose of 500 mg twice daily. Other antibacterials should be given if specifically indicated (e.g. sepsis associated with fistulas and perianal disease) and for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either azathioprine or mercaptopurine is used as a second-line treatment for fistulating Crohn’s disease and continued for maintenance [unlicensed indication]. Infliximab is used for fistulating Crohn’s disease refractory to conventional treatments; fixed-interval dosing is superior to intermittent dosing. Maintenance therapy with infliximab should be considered for patients who respond to the initial induction course of infliximab. Adalimumab can be used if there is intolerance to infliximab [unlicensed indication].

Adjunctive treatment of inflammatory bowel disease
Due attention should be paid to diet; high-fibre or low-residue diets should be used as appropriate. Antimotility drugs such as codeine and loperamide, and antispasmodics drugs may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. Laxatives may be required in proctitis. Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with colestyramine (section 1.9.2), which binds bile salts.

Clostridium difficile infection
Clostridium difficile infection is caused by colonisation of the colon with Clostridium difficile and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin, amoxicillin, co-amoxiclav, second- and third-generation cephalosporins, clindamycin, and quinolones, but few antibiotics are free of this side-effect. Oral metronidazole (see section 5.1.11) or oral vancomycin (see section 5.1.7) are used as specific treatment; vancomycin may be preferred for very sick patients. Metronidazole can be given by intravenous infusion if oral treatment is inappropriate.
Diverticular disease

Diverticular disease is treated with a high-fibre diet, bran supplements, and bulk-forming drugs (section 1.6.1). Antispasmodics may provide symptomatic relief when colic is a problem (section 1.2). Antibacterials are used only when the diverticula in the intestinal wall become infected. Antimotility drugs which slow intestinal motility, e.g. codeine, diphenoxylate, and loperamide could possibly exacerbate the symptoms of diverticular disease and are contra-indicated.

Irritable bowel syndrome

Irritable bowel syndrome can present with pain, constipation, or diarrhoea. In some patients there may be important psychological aggravating factors which respond to reassurance and possibly specific treatment e.g. with an antidepressant.

The fibre intake of patients with irritable bowel syndrome should be reviewed. If an increase in dietary fibre is required, soluble fibre (e.g. ispaghula husk, sterculia, or oats) is recommended; insoluble fibre (e.g. bran) may exacerbate symptoms and its use should be discouraged. A laxative (section 1.6) can be used to treat constipation. An osmotic laxative, such as a macrogol, is preferred; lactulose may cause bloating. Stimulant laxatives should be avoided or used only occasionally. Loperamide (section 1.4.2) may relieve diarrhoea and antispasmodic drugs (section 1.2) may relieve pain. Opioids with a central action, such as codeine, are better avoided because of the risk of dependence.

A tricyclic antidepressant (section 4.3.1) can be used for abdominal pain or discomfort [unlicensed indication] in patients who have not responded to laxatives, loperamide, or antispasmodics. Low doses of a tricyclic antidepressant are used (e.g. amitriptyline, initially 5–10 mg each night, increased if necessary in steps of 10 mg at intervals of at least 2 weeks to max. 30 mg each night). A selective serotonin reuptake inhibitor (section 4.3.3) may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Malabsorption syndromes

Individual conditions need specific management and also general nutritional consideration. Coeliac disease (gluten enteropathy) usually needs a gluten-free diet and pancreatic insufficiency needs pancreatic supplements (section 1.9.4). For further information on foods for special diets (ACBS), see Appendix 7.

For notes above; also history of asthma; interactions: Appendix 1 (aminosalicylates)

Contra-indications Aminosalicylates should be avoided in salicylate hypersensitivity.

Side-effects Side-effects of the aminosalicylates include diarrhoea, nausea, vomiting, abdominal pain, exacerbation of symptoms of colitis, headache, hypersensitivity reactions (including rash and urticaria); side-effects that occur rarely include acne pancreatitis, hepatitis, myocardiitis, pericarditis, lung disorders (including eosinophilia and fibrosing alveolitis), peripheral neuropathy, blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinemia, neutropenia, and thrombocytopenia—see also recommendation above), renal dysfunction (interstitial nephritis, nephrotic syndrome), myalgia, arthralgia, skin reactions (including lupus erythematosus-like syndrome, Stevens-Johnson syndrome), alopecia.

Balsalazide sodium

Indications treatment of mild to moderate ulcerative colitis and maintenance of remission

Contra-indications see notes above

Hepatic impairment avoid in severe impairment

Renal impairment manufacturer advises avoid in moderate to severe impairment

Pregnancy manufacturer advises avoid

Breast-feeding monitor infant for diarrhoea

Side-effects see notes above; also cholelithiasis

Dose
- Acute attack, 2.25 g 3 times daily until remission occurs or for up to max. 12 weeks
- Maintenance, 1.5 g twice daily, adjusted according to response (max. 6 g daily)
- Child under 18 years see BNF for Children

Colazide® (Almirall) Capsules, beige, balsalazide sodium 750 mg. Net price 130-cap pack = £30.42. Label: 21, 25, counseling, blood disorder symptoms (see recommendation above)
1.5.1 Aminosalicylates

MESALAZINE

**Indications** treatment of mild to moderate ulcerative colitis and maintenance of remission; see also under preparations

**Cautions** see notes above; elderly; interactions: Appendix 1 (aminosalicylates)

**Blood disorders** see recommendation above

**Contra-indications** see notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** use with caution; avoid if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy** negligible quantities cross placenta

**Breast-feeding** diarrhoea reported but negligible amounts detected in breast milk; monitor infant for diarrhoea

**Side-effects** see notes above

**Dose**

- Note The delivery characteristics of oral mesalazine preparations may vary; these preparations should not be considered interchangeable

Asacol® (Warner Chilcott) (BNF 61)

**Foam enema** mesalazine 1 g/metered application, net price £26.72. Counselling, blood disorder symptoms (see recommendation above)

- Excipients include disodium edetate, hydroxybenzoates (parabens), polysorbate 20, sodium metabisulphite

**Dose** acute attack affecting the rectosigmoid region, 1 metered application (mesalazine 1 g) into the rectum daily for 4–6 weeks; acute attack affecting the descending colon, 2 metered applications (mesalazine 2 g) once daily for 4–6 weeks; CHILD 12–18 years, see BNF for Children

**Suppositories**, mesalazine 250 mg, net price £20.20. Label: 25, counselling, blood disorder symptoms (see recommendation above)

**Dose** acute attack or maintenance, by rectum 0.75–1.5 g daily in divided doses, with last dose at bedtime; CHILD 12–18 years, see BNF for Children

Asacol® MR (Warner Chilcott) (BNF 61)

**Tablets**, red, e/c, mesalazine 400 mg, net price £29.41; 120-tab pack = £39.21. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

**Dose** ulcerative colitis, acute attack, 2 g daily in divided doses; maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis, 1.2–2.4 g daily in divided doses; CHILD 12–18 years, see BNF for Children

**Tablets**, red-brown, e/c, mesalazine 800 mg, net price £17.62. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

**Dose** acute attack, 2.4 g daily in divided doses; maintenance, 1.2–2.4 g daily in divided doses; CHILD 12–18 years, see BNF for Children

**Note** Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

Ipocol® (Sandoz) (BNF 61)

**Tablets**, e/c, mesalazine 400 mg, net price £41.62. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

**Dose** acute attack, 2.4 g daily in divided doses; maintenance, 1.2–2.4 g daily in divided doses; CHILD 12–18 years, see BNF for Children

**Note** Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

Mesren® MR (IVAX) (BNF 61)

**Tablets**, red-brown, e/c, mesalazine 400 mg, net price 90-tab pack = £19.50; 120-tab pack = £26.00. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

**Dose** ADULT and CHILD over 12 years, ulcerative colitis, acute attack, 2.4 g daily in divided doses; maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis, 1.2–2.4 g daily in divided doses

Mezavant® XL (Shire) (BNF 61)

**Tablets**, m/r, red-brown, e/c, mesalazine 1.2 g, net price 60-tab pack = £62.44. Label: 21, 25, counselling, blood disorder symptoms (see recommendations above)

**Dose** ADULT over 18 years, acute attack, 2.4 g once daily, if necessary to 4.8 g once daily (review treatment at 8 weeks); maintenance, 2.4 g once daily

Pentasa® (Ferring) (BNF 61)

**Tablets**, m/r, scored, mesalazine 500 mg (grey), net price 100-tab pack = £24.21. Counselling, administration, see dose, blood disorder symptoms (see recommendation above)

**Dose** ADULT and CHILD over 15 years, acute attack, up to 4 g daily in 2–3 divided doses; maintenance, 2 g once daily; tablets may be dispersed in water, but should not be chewed; CHILD 5–15 years see BNF for Children

**Granules**, m/r, pale grey-brown, mesalazine 1 g/sachet, net price 50-sachet pack = £28.82; 2 g/sachet, 60-sachet pack = £72.05. Counselling, administration, see dose, blood disorder symptoms (see recommendation above)

**Dose** acute attack, up to 4 g daily in 2–4 divided doses; maintenance, 2 g once daily; granules should be placed on tongue and washed down with water or orange juice without chewing; CHILD 5–15 years see BNF for Children

**Retention enema**, mesalazine 1 g in 100-mL pack. Net price 7 enemas = £17.73. Counselling, administration, see dose, blood disorder symptoms (see recommendation above)

**Dose** by rectum ADULT and CHILD over 12 years, 1 enema at bedtime

**Suppositories**, mesalazine 1 g. Net price 28-suppos pack = £40.01. Counselling, blood disorder symptoms (see recommendation above)

**Dose** by rectum ulcerative proctitis, ADULT and CHILD over 15 years, acute attack, 1 g daily for 2–4 weeks; maintenance, 1 g daily, CHILD 12–15 years see BNF for Children

Salofalk® (Dr Falk) (BNF 61)

**Tablets**, e/c, yellow, mesalazine 250 mg. Net price 100-tab pack = £16.19. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

**Dose** acute attack, 0.5–1 g 3 times daily; maintenance, 500 mg three times daily; CHILD 12–18 years see BNF for Children

**Granules**, m/r, grey, e/c, vanillia-flavoured, mesalazine 500 mg/sachet, net price 100-sachet pack = £28.74; 1 g/sachet, 50-sachet pack = £28.74; 1.5 g/sachet, 60-sachet pack = £48.85. Label: 25, counselling, administration, see dose, blood disorder symptoms (see recommendation above)

- Excipients include aspartame (section 9.4.1)

**Dose** acute attack, 1.5–3 g once daily (preferably in the morning) or 0.5–1.5 g 3 times daily; maintenance, 500 mg 3 times daily; CHILD 6–18 years see BNF for Children

**Counselling** granules should be placed on tongue and washed down with water without chewing

**Note** Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

BNF 61
Suppositories, mesalazine 500 mg. Net price 30-suppos pack = £14.81. Counselling, blood disorder symptoms (see recommendation above)

**Dose**
- **ADULT** and **CHILD** over 15 years, acute attack, by rectum, 0.5–1 g 2–3 times daily adjusted according to response; **CHILD** 12–15 years see **BNF for Children**
- **Enema**, mesalazine 2 g in 59-mL pack. Net price 7 enemas = £29.92. Counselling, blood disorder symptoms (see recommendation above)

**Rectal foam**, mesalazine 1 g metered application, net price 4–14-application canister with disposable applicators and plastic bags = £30.17. Counselling, blood disorder symptoms (see recommendation above)

**Excipients** include crocetin, polyethylene glycol, sodium metabisulphite.

**Dose** mild ulcerative colitis affecting sigmoid colon and rectum, **ADULT** and **CHILD** over 12 years, 2 metered applications (mesalazine 2 g) into the rectum at bedtime or in 2 divided doses

---

**OLSALAZINE SODIUM**

**Indications** treatment of mild ulcerative colitis and maintenance of remission

**Cautions** see notes above; **Interactions**: Appendix 1 (aminsalicylates)

**Blood disorders** See recommendation above

**Contra-indications** see notes above

**Renal impairment** use with caution; manufacturer advises avoid in significant impairment

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** monitor infant for diarrhoea

**Side-effects** see notes above; watery diarrhoea common over 4 g daily;

**Interactions:**
- **Acute porphyria** (section 9.8.2); methotrexate, rifampicin, isoniazid
- **Hepatic impairment** use with caution
- **Renal impairment** risk of toxicity, including crystaluria, in moderate impairment
- **Blood disorders** (section 10.1.3)

**Dose**
- **ADULT** and **CHILD** over 12 years, acute attack, 1 g daily in divided doses after meals increased if necessary over 1 week to max. 3 g daily (max. single dose 1 g); maintenance, 500 mg twice daily after meals
- **CHILD** under 12 years see **BNF for Children**

**Dipentum** (UCB Pharma)

**Capsules**, brown, olsalazine sodium 250 mg. Net price 112-cap pack = £19.77. Label: 21, counselling, blood disorder symptoms (see recommendation above)

**Tablets**, yellow, scored, olsalazine sodium 500 mg. Net price 60-tab pack = £21.18. Label: 21, counselling, blood disorder symptoms (see recommendation above)

---

**SULFASALAZINE** (Sulphasalazine)

**Indications** treatment of mild to moderate and severe ulcerative colitis and maintenance of remission; active Crohn's disease; rheumatoid arthritis (section 10.1.3)

**Cautions** see notes above; also history of allergy or asthma; G6PD deficiency (section 9.1.5); slow acetylator status; risk of haematological and hepatic toxicity (differential white cell, red cell, and platelet counts initially and at monthly intervals for first 3 months; liver function tests at monthly intervals for first 3 months); maintain adequate fluid intake; upper gastro-intestinal side-effects common over 4 g daily; acute porphyria (section 9.8.2); **Interactions**: Appendix 1 (aminsalicylates)

**Blood disorders** See recommendation above

**Contra-indications** see notes above; also sulphonamide hypersensitivity; child under 2 years of age

**Hepatic impairment** use with caution

**Renal impairment** risk of toxicity, including crystaluria, in moderate impairment—ensure high fluid intake; avoid in severe impairment

**Pregnancy** theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother

**Breast-feeding** small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants

**Side-effects** see notes above; also cough, insomnia, dizziness, fever, blood disorders (including Heinz body anaemia, megaloblastic anaemia), proteinuria, tinnitus, stomatitis, taste disturbances, and pruritus; less commonly dyspnoea, depression, convulsions, vasculitis, and alopecia; also reported loss of appetite, hypersensitivity reactions (including exfoliative dermatitis, epidermal necrolysis, photosensitivity, anaphylaxis, serum sickness), ataxia, hallucinations, aseptic meningitis, oligospermia, crystalluria, disturbances of smell, and parotitis; yellow-orange discoloration of skin, urine, and other body fluids; some soft contact lenses may be stained

**Dose**
- **By mouth**, acute attack 1–2 g 4 times daily but see precautions until remission occurs (if necessary corticosteroids may also be given), reducing to a maintenance dose of 500 mg 4 times daily; **CHILD** 2–12 years see **BNF for Children**
- **By rectum**, in suppositories, alone or in conjunction with oral treatment 0.5–1 g morning and night after a bowel movement; **CHILD** 5–12 years see **BNF for Children**

**Sulfasalazine** (Non-proprietary)

**Tablets**, sulfasalazine 500 mg, net price 112 = £6.74. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

**Tablets**, e/c, sulfasalazine 500 mg. Net price 112-tab pack = £14.46. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

**Brands include Sulazine EC**

**Suspension**, sulfasalazine 250 mg/5 mL, net price 500 mL = £29.50. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

**Excipients** include alcohol

**Salazopyrin** (Pharmacia)

**Tablets**, yellow, scored, sulfasalazine 500 mg, net price 112-tab pack = £6.97. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

**EN-Tabs** (= tablets e/c), yellow, I/c, sulfasalazine 500 mg, net price 112-tab pack = £8.43. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

**Suppositories**, yellow, sulfasalazine 500 mg, net price 10 = £3.30. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained
1.5.2 Corticosteroids

For the role of corticosteroids in acute ulcerative colitis and Crohn’s disease, see Inflammatory Bowel Disease, p. 59.

BECLOMETASONE DIPROPIONATE

**Indications**
adjunct to aminosalicylates in acute mild to moderate ulcerative colitis; asthma (section 3.2); allergic and vasomotor rhinitis (section 12.2.1); oral ulceration (unlicensed indication) (section 12.3.1)

**Cautions** section 6.3.2; interactions: Appendix 1 (corticosteroids)

**Contra-indications** section 6.3.2

**Hepatic impairment** manufacturer advises avoid in severe impairment—no information available

**Pregnancy** section 6.3.2

**Breast-feeding** section 6.3.2

**Side-effects** section 6.3.2; also nausea, constipation, headache, and drowsiness

**Dose**

- 5 mg in the morning; max. duration of treatment 4 weeks; CHILD safety and efficacy not established
- CHILD, 3 mg 3 times daily; maintenance, 3 mg twice daily
- ADULT, 2 mg) once daily for up to 8 weeks

**Clipper** (Chiesi) (c)

Tablets, m/r, ivory, beclometasone dipropionate 5 mg, net price 30-tab pack = £56.56. Label: 25

**BUDESONIDE**

**Indications** see preparations

**Cautions** section 6.3.2; for autoimmune hepatitis, monitor liver function tests every 2 weeks and at least every 3 months; interactions: Appendix 1 (corticosteroids)

**Contra-indications** section 6.3.2

**Hepatic impairment** section 6.3.2

**Pregnancy** section 6.3.2

**Breast-feeding** section 6.3.2

**Side-effects** section 6.3.2

**Dose**

- See preparations

**Budenofalk** (Dr Falk) (c)

Tablets, pink, enclosing e/c granules, budesonide 3 mg, net price 100-cap pack = £75.05. Label: 5, 10, steroid card, 25

**Dose** mild to moderate Crohn’s disease affecting ileum or ascending colon, chronic diarrhoea due to collagenous colitis, CHILD over 18 years, 3 mg 3 times daily for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment (see also section 6.3.2); CHILD 12–18 years see BNF for Children

Autoimmune hepatitis, ADULT over 18 years, induction of remission, 3 mg 3 times daily; maintenance, 3 mg twice daily

Rectal foam, budesonide 2 mg/metered application, net price 14-application canister with applicator = £33.00

Dose ulcerative colitis affecting sigmoid colon and rectum, by rectum, ADULT over 18 years, 1 metered application (budesonide 2 mg) once daily for up to 8 weeks

**HYDROCORTISONE**

**Indications** ulcerative colitis, proctitis, proctosigmoiditis

**Cautions** section 6.3.2; systemic absorption may occur; prolonged use should be avoided

**Contra-indications** intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

**Side-effects** section 6.3.2; also local irritation

**Dose**

- By rectum see preparations

**Coliflaxone** (Meda) (c)

Foam in aerosol pack, hydrocortisone acetate 10%, net price 14-application canister with applicator = £9.28

Excipients include cetly alcohol, hydroxybenzoates (parabens), propylene glycol
dose initially 1 metered application (125 mg hydrocortisone acetate) inserted into the rectum once or twice daily for 3-3 weeks, then once on alternate days; CHILD 2–18 years see BNF for Children

**PREDNISOLONE**

**Indications** ulcerative colitis, and Crohn’s disease; other indications, see section 6.3.2, see also preparations

**Cautions** section 6.3.2; systemic absorption may occur with rectal preparations; prolonged use should be avoided

**Contra-indications** section 6.3.2; intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

**Hepatic impairment** section 6.3.2

**Renal impairment** section 6.3.2

**Pregnancy** section 6.3.2

**Breast-feeding** section 6.3.2

**Side-effects** section 6.3.2

**Dose**

- By mouth, initially 20–40 mg daily (up to 60 mg daily in some cases), preferably taken in the morning after breakfast; continued until remission occurs, followed by reducing doses
- By rectum, see preparations

**Oral preparations**

Section 6.3.2

**Entocort** (AstraZeneca) (c)

CR Capsules, grey/pink, enclosing e/c, m/r granules, budesonide 3 mg, net price 100-cap pack = £99.00. Label: 5, 10, steroid card, 25

Note Dispense in original container (contains desiccant)

Dose mild to moderate Crohn’s disease affecting the ileum or ascending colon, 9 mg once daily in the morning for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment (see also section 6.3.2); CHILD 12–18 years see BNF for Children

Enema, budesonide 2 mg/100 mL when dispersible tablet reconstituted in isotonic saline vehicle, net price pack of 7 dispersible tablets and bottles of vehicle = £33.00

Dose ulcerative colitis involving rectal and recto-sigmoid disease, by rectum, 1 enema at bedtime for 4 weeks; CHILD 12–18 years see BNF for Children
1.5.3 Drugs affecting the immune response

For the role of azathioprine, ciclosporin, mercaptopurine, and methotrexate in the treatment of inflammatory bowel disease, see p. 59.

Folic acid (section 9.1.2) should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given at a dose of 5 mg once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

AZATHIOPRINE

Indications see under Inflammatory Bowel Disease, p. 59; autoimmune conditions and prophylaxis of transplant rejection (section 8.2.1); rheumatoid arthritis (section 10.1.3); severe refractory eczema (section 13.5.3)

Cautions section 8.2.1

Contra-indications section 8.2.1

Hepatic impairment section 8.2.1

Renal impairment section 8.2.1

Pregnancy section 8.1.3

Breast-feeding section 8.1.3

Side-effects section 8.2.1

Dose
- Severe acute Crohn’s disease, maintenance of remission of Crohn’s disease or ulcerative colitis [unlicensed indications], ADULT over 18 years, by mouth, 2–2.5 mg/kg daily; some patients may respond to lower doses

Preparations Section 8.1.3

METHOTREXATE

Indications see under Inflammatory Bowel Disease, p. 59; malignant disease (section 8.1.3); rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.5)

Cautions section 10.1.3

Contra-indications section 10.1.3

Hepatic impairment section 10.1.3

Renal impairment section 10.1.3

Pregnancy section 10.1.3

Breast-feeding section 10.1.3

Side-effects section 10.1.3
Cytokine modulators

Infliximab and adalimumab are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision. Adequate resuscitation facilities must be available when infliximab is used.

**Infliximab**

Indications see under Inflammatory Bowel Disease, p. 200 mg 4 times daily before meals; may be increased if necessary after 2–13 weeks to a max. of 40 mg/kg daily and then reduced according to response; discontinue if no response 14 weeks after initial dose. Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as shellfish should be managed by strict avoidance. The condition should be distinguished from symptoms of occasional food intolerance in those with irritable bowel syndrome. Sodium cromoglicate may be helpful as an adjunct to dietary avoidance.

Preparations

Section 10.1.3

**SODIUM CROMOGLICATE**

(Sodium cromoglicate)

Indications food allergy (in conjunction with dietary restriction); asthma (section 3.3.1); allergic conjunctivitis (section 11.4.2); allergic rhinitis (section 12.2.1)

Pregnancy not known to be harmful

Breast-feeding unlikely to be present in milk

Side-effects occasional nausea, rashes, and joint pain

Dose

● 200 mg 4 times daily before meals; may be increased if necessary after 2–3 weeks to a max. of 40 mg/kg daily and then reduced according to response; CHILD 2–14 years 100 mg 4 times daily before meals; may be increased if necessary after 2–3 weeks to a max. of 40 mg/kg daily and then reduced according to response

Counselling Capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking

Nalcrom® (Sanofi-Aventis)

Capsules, sodium cromoglicate 100 mg. Net price 100-cap pack = £59.75. Label: 22, counselling, see dose above
1.6 Laxatives

### 1.6.1 Bulk-forming laxatives

Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis; patients should be advised that the full effect may take some days to develop. Bulk-forming laxatives are of particular value in those with small hard stools, but should not be required unless fibre cannot be increased in the diet. A balanced diet, including adequate fluid intake and fibre is of value in preventing constipation.

Bulk-forming laxatives are useful in the management of patients with colostomy, ileostomy, haemorrhoids, anal fissure, chronic diarrhoea associated with diverticular disease, irritable bowel syndrome, and as adjuncts in ulcerative colitis (section 1.5). Adequate fluid intake must be maintained to avoid intestinal obstruction. Unprocessed wheat bran, taken with food or fruit juice, is a most effective bulk-forming preparation.

### 1.6.2 Stimulant laxatives

For the role of laxatives in the treatment of irritable bowel syndrome, see p. 61. For the prevention of opioid-induced constipation in palliative care, see p. 22. For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort. Laxatives should be administered at a time that produces an effect that is likely to fit in with the child’s toilet routine.

### 1.6.3 Faecal softeners

Macrogols (section 1.6.4) is used to clear faecal mass and to establish and maintain soft well-formed stools. If disimpaction does not occur after 2 weeks, a stimulant laxative (section 1.6.2) can be added. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate enema can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema; a bowel cleansing preparation (section 1.6.5) is an alternative. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid.

### 1.6.4 Osmotic laxatives

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses.

### 1.6.5 Bowel cleansing preparations

Pregnancy If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose, can also be used. Bisacodyl or senna may be suitable, if a stimulant effect is necessary.

The laxatives that follow have been divided into 5 main groups (sections 1.6.1–1.6.5). This simple classification disguises the fact that some laxatives have a complex action.

### 1.6.6 Peripheral opioid-receptor antagonists

Before prescribing laxatives it is important to be sure that the patient is constipated and that the constipation is not secondary to an underlying undiagnosed complaint.

It is also important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people tend to consider themselves constipated if they do not have a bowel movement each day. A useful definition of constipation is the passage of hard stools less frequently than the patient’s own normal pattern and this can be explained to the patient.

Misconceptions about bowel habits have led to excessive laxative use. Abuse may lead to hypokalaemia.

Thus, laxatives should generally be avoided except where straining will exacerbate a condition (such as angina) or increase the risk of rectal bleeding as in haemorrhoids. Laxatives are also of value in drug-induced constipation, for the expulsion of parasites after anthelmintic treatment, and to clear the alimentary tract before surgery and radiological procedures. Prolonged treatment of constipation is sometimes necessary.

For the role of laxatives in the treatment of irritable bowel syndrome, see p. 61. For the prevention of opioid-induced constipation in palliative care, see p. 22.

**Children** Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

In infants, increased intake of fluids, particularly fruit juice containing sorbitol (e.g. prune, pear, or apple), may be sufficient to soften the stool. In infants under 1 year of age with mild constipation, lactulose (section 1.6.4) can be used to soften the stool, either an oral preparation containing macrogols or, rarely, glycerol suppositories can be used to clear faecal impaction. The infant should be referred to a hospital paediatric specialist if these measures fail.

The diet of children over 1 year of age should be reviewed to ensure that it includes an adequate intake of fibre and fluid. An osmotic laxative containing macrogols (section 1.6.4) can also be used, particularly in children with chronic constipation; lactulose is an alternative in children who cannot tolerate a macrogol. If there is an inadequate response to the osmotic laxative, a stimulant laxative (section 1.6.2) can be added.

Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing macrogols (section 1.6.4) is used to clear faecal mass and to establish and maintain soft well-formed stools. If disimpaction does not occur after 2 weeks, a stimulant laxative (section 1.6.2) can be added. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate enema can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema; a bowel cleansing preparation (section 1.6.5) is an alternative. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid.

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses.

**For children with chronic constipation,** it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort. Laxatives should be administered at a time that produces an effect that is likely to fit in with the child’s toilet routine.

**Pregnancy** If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose, can also be used. Bisacodyl or senna may be suitable, if a stimulant effect is necessary.

The laxatives that follow have been divided into 5 main groups (sections 1.6.1–1.6.5). This simple classification disguises the fact that some laxatives have a complex action.
1.6.2 Stimulant laxatives

Finely ground bran, though more palatable, has poorer water-retaining properties, but can be taken as bran bread or biscuits in appropriately increased quantities. Oat bran is also used.

Methylcellulose, ispaghula, and sterculia are useful in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

**ISPAGHULA HUSK**

**Indications** see notes above

**Cautions** adequate fluid intake should be maintained to avoid intestinal obstruction—it may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility

**Contra-indications** difficulty in swallowing, intestinal obstruction, colonic atony, faecal impaction

**Side-effects** flatulence, abdominal distension, gastrointestinal obstruction or impaction; hypersensitivity reported

**Dose**
- See preparations below

**Counselling** Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

**Fibrelife** (Manx)

Granules, sugar- and gluten-free, ispaghula husk 3.5 g/sachet (natural or orange flavour), net price 10 sachets = £1.23, 30 sachets = £2.07. Label: 13, counselling, see above

Excipients include aspartame (section 9.4.1)

**Dose**
- Adult and Child over 12 years, 1-6 sachets daily in water in 1-3 divided doses, preferably after meals

**Fybogel** (Reckitt Benckiser)

Granules, buff, effervescent, sugar- and gluten-free, ispaghula husk 3.5 g/sachet (low Na+), net price 30 sachets (plain, lemon, or orange flavour) = £1.84. Label: 13, counselling, see above

Excipients include aspartame 16 mg/sachet (see section 9.4.1)

**Dose**
- 1 sachet or 2 level 5-mL spoonfuls in water twice daily preferably after meals; *Child* (but see section 1.6) 2-12 years ½-1 level 5-mL spoonful in water, twice daily preferably after meals (*Child* 2-6 years on specialist practitioner’s advice only)

**Isogel** (Potters)

Granules, brown, sugar- and gluten-free, ispaghula husk 90%. Net price 200 g = £2.67. Label: 13, counselling, see above

**Dose**
- Constipation, 2 level 5-mL spoonfuls in water once or twice daily, preferably at mealtimes; *Child* (but see section 1.6) 2-12 years, 1 level 5-mL spoonful in water once or twice daily, preferably at mealtimes

Diarrhoea (section 1.4.1), 1 level 5-mL spoonful 3 times daily

**Note** May be difficult to obtain

**Ispagel Orange** (LPJ)

Granules, beige, effervescent, sugar- and gluten-free, ispaghula husk 3.5 g/sachet, net price 30 sachets = £2.10. Label: 13, counselling, see above

Excipients include aspartame [section 9.4.1]

**Dose**
- 1 sachet in water 1-3 times daily, preferably after meals; *Child* (but see section 1.6) 2-6 years, see BNF for Children, 6-12 years 2.5-5 mL in water 1-3 times daily, preferably after meals

**Regulan** (Procter & Gamble)

Powder, beige, sugar- and gluten-free, ispaghula husk 3.4 g/5.85-g sachet (orange or lemon/lime flavour). Net price 30 sachets = £2.44. Label: 13, counselling, see above

Excipients include aspartame [section 9.4.1]

**Dose**
- 1 sachet in 150 mL water 1-3 times daily, preferably after meals; *Child* (but see section 1.6) 2-6 years, see BNF for Children, 6-12 years 2.5-5 mL in water 1-3 times daily, preferably after meals

**METHYLCHELLOSE**

**Indications** see notes above

**Cautions** see under Ispaghula Husk

**Contra-indications** see under Ispaghula Husk; also infective bowel disease

**Side-effects** see under Ispaghula Husk

**Dose**
- See preparations below

**Counselling** Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

**Celevac** (Amdipharm)

Tablets, pink, scored, methylcellulose ‘450’ 500 mg, net price 112-tab pack = £3.22. Counselling, see above and dose

**Dose**
- Constipation and diarrhoea, 3-6 tablets twice daily; in constipation the dose should be taken with at least 300 mL liquid, in diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose; *Child* 7-12 years see BNF for Children

**STERCULIA**

**Indications** see notes above

**Cautions** see under Ispaghula Husk

**Contra-indications** see under Ispaghula Husk

**Side-effects** see under Ispaghula Husk

**Dose**
- See under preparations below

**Counselling** Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

**Normacol** (Norgine)

Granules, coated, gluten-free, sterculia 62%. Net price 500 g = £5.94; 60 × 7-g sachets = £4.99.

Label: 25, 27, counselling, see above

**Dose**
- 1-2 heaped 5-mL spoonfuls, or the contents of 1-2 sachets, washed down without chewing with plenty of liquid once or twice daily after meals; *Child* (but see section 1.6) 6-12 years half adult dose

**Normacol Plus** (Norgine)

Granules, brown, coated, gluten-free, sterculia 62%, frangula (standardised) 8%. Net price 500 g = £6.34; 60 × 7-g sachets = £5.34. Label: 25, 27, counselling, see above

**Dose**
- Constipation and after haemorrhoidectomy, 1-2 heaped 5-mL spoonfuls or the contents of 1-2 sachets washed down without chewing with plenty of liquid once or twice daily after meals; *Child* 6-12 years see BNF for Children

**1.6.2 Stimulant laxatives**

Stimulant laxatives include bisacodyl, sodium picosulphate, and members of the *anthraquinone* group, *senna* and *dantron*. The indications for dantron are limited (see below) by its potential carcinogenicity (based on rodent carcinogenicity studies) and evidence of genotoxicity. Powerful stimulants such as *cascara* (an anthraquinone) and *castor oil* are obsolete. *Docusate sodium* probably acts both as a stimulant and as a softening agent.

Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction. Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia; however, prolonged use may be justifiable in some circumstances (see section 1.6.8 for the use of stimulant laxatives in children).
Glycerol suppositories act as a rectal stimulant by virtue of the mildly irritating action of glycerol.

The parasympathomimetics bethanechol, distigmine, neostigmine, and pyridostigmine (see section 7.4.1 and section 10.2.1) enhance parasympathetic activity in the gut and increase intestinal motility. They are rarely used for their gastro-intestinal effects. Organic obstruction of the gut must first be excluded and they should not be used shortly after bowel anastomosis.

### BISACODYL

**Indications** see under Dose  
**Cautions** see notes above  
**Contra-indications** see notes above, acute surgical abdominal conditions, acute inflammatory bowel disease, severe dehydration  
**Pregnancy** see Pregnancy, p. 67  
**Side-effects** see notes above; nausea and vomiting; colitis also reported; suppositories, local irritation  
**Dose**  
- Constipation, by mouth, 5–10 mg at night, increased if necessary to max. 20 mg at night; **CHILD** (but see section 1.6) 4–18 years 5–20 mg once daily, adjusted according to response  
- By rectum in suppositories, 10 mg in the morning; **CHILD** (but see section 1.6) 2–18 years 5–10 mg once daily, adjusted according to response  
- Before radiological procedures and surgery, by mouth, 10 mg in the morning and 10 mg in the evening on the day before procedure, and by rectum in suppositories, 10 mg 1–2 hours before procedure the following day; **CHILD** 4–18 years see BNF for Children  
**Note** tablets act in 10–12 hours; suppositories act in 20–60 minutes

Bisacodyl (Non-proprietary)  
**Tablets**, e/c, bisacodyl 5 mg. Net price 100 = £15.87. Label: 14, (urine red)  
**Suppositories**, bisacodyl 10 mg. Net price 12 = £1.11  
**Paediatric suppositories**, bisacodyl 5 mg. Net price 5 = £0.94  

*Note* The brand name Dulcolax® (Boehringer Ingelheim) is used for bisacodyl tablets, net price 10-tab pack = £4.09; suppositories (10 mg), 10 = £1.57; paediatric suppositories (5 mg), 5 = £0.94  
*The brand names Dulcolax®, Pico Liquid and Dulcolax® Pico Perles are used for sodium picosulfate preparations*

### DANTRON

(Danthron)  
**Indications** only for constipation in terminally ill patients of all ages  
**Cautions** see notes above; *rodent* studies indicate potential carcinogenic risk; avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies)—risk of irritation and excoriation  
**Contra-indications** see notes above  
**Pregnancy** manufacturers of co-danthramer and co-danthrusate advise avoid—no information available  
**Breast-feeding** manufacturers of co-danthramer and co-danthrusate advise avoid—limited information available  
**Side-effects** see notes above; urine may be coloured red  
**Dose**  
- See under preparations

#### With poloxamer ‘188’ (as co-danthramer)  
**Note** Co-danthramer suspension 5 mL = one co-danthramer capsule, but strong co-danthramer suspension 5 mL = two strong co-danthramer capsules

**Co-danthramer** (Non-proprietary)  
**Capsules**, co-danthramer 25/200 (dantron 25 mg, poloxamer ‘188’ 200 mg). Net price 60-cap pack = £12.86. Label: 14, (urine red)  
**Dose** 1–2 capsules at bedtime; **CHILD** 1 capsule at bedtime (restricted indications, see notes above)  
**Strong capsules**, co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer ‘188’ 500 mg). Net price 60-cap pack = £15.55. Label: 14, (urine red)  
**Dose** ADULT and **CHILD** over 12 years, 1–2 capsules at bedtime (restricted indications, see notes above)  
**Suspension**, co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer ‘188’ 200 mg/5 mL). Net price 300 mL = £11.27. 1 litre = £37.57. Label: 14, (urine red)  
**Dose** 5–10 mL at night; **CHILD** 2.5–5 mL at night (restricted indications, see notes above)  
**Brands include** Codolax®, Danlux®

**Strong suspension**, co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer ‘188’ 1 g/5 mL). Net price 300 mL = £30.13. Label: 14, (urine red)  
**Dose** ADULT and **CHILD** over 12 years, 5 mL at night (restricted indications, see notes above)  
**Brands include** Codolax Forte®, Ducolax®

#### With docusate sodium (as co-danthrusate)

**Co-danthrusate** (Non-proprietary)  
**Capsules**, co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg). Net price 63-cap pack = £15.87. Label: 14, (urine red)  
**Dose** 1–3 capsules at night; **CHILD** 6–12 years 1 capsule at night (restricted indications, see notes above)  
**Brands include** Normax®

**Suspension**, yellow, co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL). Net price 200 mL = £8.75. Label: 14, (urine red)  
**Dose** 5–15 mL at night; **CHILD** 6–12 years 5 mL at night (restricted indications, see notes above)  
**Brands include** Doralax®, Codolax®, Danlux®, Danlax®, Danlax®, Normax®

### DOCUSATE SODIUM

(Dioctyl sodium sulphosuccinate)  
**Indications** constipation, adjunct in abdominal radiological procedures  
**Cautions** see notes above; do not give with liquid paraffin; rectal preparations not indicated if haemorrhoids or anal fissure  
**Contra-indications** see notes above  
**Pregnancy** not known to be harmful—manufacturer advises caution  
**Breast-feeding** present in milk following oral administration—manufacturer advises caution; rectal administration not known to be harmful  
**Side-effects** see notes above  
**Dose**  
- By mouth, chronic constipation, up to 500 mg daily in divided doses; **CHILD** (but see section 1.6) 6 months–2 years 12.5 mg 3 times daily, adjusted according to response (use paediatric solution); 2–12 years 12.5–25 mg 3 times daily, adjusted according to response (use paediatric oral solution)  
**Note** Oral preparations act within 1–2 days  
With barium meal, **ADULT** and **CHILD** over 12 years, 400 mg
70 1.6.3 Faecal softeners

Dioctyl® (UCB Pharma)
Capsules, yellow/white, docusate sodium 100 mg, net price 30-cap pack = £1.92, 100-cap pack = £6.40

Docusol® (Typharm)
Adult oral solution, sugar-free, docusate sodium 50 mg/5 mL, net price 300 mL = £5.49
Paediatric oral solution, sugar-free, docusate sodium 12.5 mg/5 mL, net price 300 mL = £5.29

Rectal preparations
Norgalax Micro-enema® (Norgine)
Enema, docusate sodium 120 mg in 10-g single-dose disposable packs. Net price 10-g unit = 57p
Dose ADULT and CHILD (but see section 1.6) over 12 years, 10-g unit

Glycerol (Glycerin)
Indications constipation
Dose

Glycerol Suppositories, BP
(Glycerin Suppositories)
Suppositories, gelatin 140 mg, glycerol 700 mg, purified water to 1 g, net price 12 = £1.27 (1 g), £1.29 (2 g), £1.49 (4 g)
Dose 1 suppository moistened with water before use, when required. The usual sizes are for INFANT under 1 year, small (1-g mould), CHILD 1–12 years medium (2-g mould), ADULT and CHILD over 12 years, large (4-g mould)

Senna
Indications constipation
Cautions see notes above
Contra-indications see notes above
Pregnancy see Pregnancy, p. 67
Breast-feeding not known to be harmful
Side-effects see notes above
Dose

Sodium Picosulfate
(Sodium picosulphate)
Indications constipation; bowel evacuation before abdominal radiological and endoscopic procedures on the colon, and surgery (section 1.6.5); acts within 6–12 hours
Cautions see notes above; active inflammatory bowel disease (avoid if fulminant)
Contra-indications see notes above; severe dehydration
Pregnancy see Pregnancy, p. 67
Breast-feeding not known to be present in milk but manufacturer advises avoid unless potential benefit outweighs risk
Side-effects see notes above
Dose

Bowel cleansing preparations
Section 1.6.5

Other stimulant laxatives
Unstandardised preparations of cascara, frangula, rhubarb, and senna should be avoided as their laxative action is unpredictable. Aloe, colocynth, and jalap should be avoided as they have a drastic purgative action.

1.6.3 Faecal softeners

Liquid paraffin, the traditional lubricant, has disadvantages (see below). Bulk laxatives (section 1.6.1) and non-ionic surfactant ‘wetting’ agents e.g. docusate sodium (section 1.6.2) also have softening properties. Such drugs are useful for oral administration in the management of haemorrhoids and anal fissure; glycerol (section 1.6.2) is useful for rectal use. Enemas containing arachis oil (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement.
### 1.6.4 Osmotic laxatives

**Arachis Oil Enema** (Non-proprietary)

**Enema**, arachis (peanut) oil in 130-mL single-dose disposable packs. Net price 130 mL = £7.98

**Dose** to soften impacted faeces, 130 mL; the enema should be warmed before use; **CHILD** (but see section 1.6) under 3 years not recommended; over 3 years reduce adult dose in proportion to body-weight (medical supervision only), see **BNF for Children**

**Liquid Paraffin Oral Emulsion, BP**

**Indications** constipation

**Cautions** avoid prolonged use; contra-indicated in children under 3 years

**Side-effects** anal seepage of paraffin and consequent anal irritation after prolonged use, granulomatous reactions caused by absorption of small quantities of liquid paraffin (especially from the emulsion), lipid pneumonia, and interference with the absorption of fat-soluble vitamins

**Dose**

- See under preparation

**Liquid Paraffin Oral Emulsion, BP**

**Oral emulsion**, liquid paraffin 5 mL, vanillin 5 mg, chloroform 0.025 mL, benzoic acid solution 0.2 mL, methylcellulose-20 200 mg, saccharin sodium 500 micrograms, water to 10 mL

**Dose** **ADULT** over 18 years, 10–30 mL at night when required

**Counselling** Should not be taken immediately before going to bed

**Side-effects** nausea (can be reduced by administration with water, fruit juice or with meals), vomiting, flatulence, cramps, and abdominal discomfort

**Dose**

- See under preparations below

**Lactulose** (Non-proprietary)

**Solution**, lactulose 3.1–3.7 g/5 mL with other ketoses. Net price 300-mL pack = £2.10, 500-mL pack = £2.59

**Dose** constipation, initially 15 mL twice daily, adjusted according to response; **CHILD** (but see section 1.6) under 1 year 2.5 mL twice daily, adjusted according to response; 1–5 years 2.5–10 mL twice daily, adjusted according to response; 5–18 years 5–20 mL twice daily, adjusted according to response

**Hepatic encephalopathy**, 30–50 mL 3 times daily, subsequently adjusted to produce 2–3 soft stools daily; **CHILD** 12–18 years see **BNF for Children**

**Note** Lactulose doses in **BNF** may differ from those in product literature

**Brands Include** *Duphalac*, *Lactugol*, *Regulose*

**MACROGOLS**

**Polyethylene glycols**

**Indications** see preparations below

**Cautions** discontinue if symptoms of fluid and electrolyte disturbance; see also preparations below

**Contra-indications** intestinal perforation or obstruction, paralytic ileus, severe inflammatory conditions of the intestinal tract (such as Crohn’s disease, ulcerative colitis, and toxic megacolon), see also preparations below

**Pregnancy** manufacturers advice use only if essential—no information available

**Breast-feeding** manufacturers advice use only if essential—no information available

**Side-effects** abdominal distension and pain, nausea, flatulence

**Dose**

- See preparations below

**Macrogol Oral Powder, Compound** (Non-proprietary)

**Oral powder**, macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet, net price 20-sachet pack = £4.45, 30-sachet pack = £6.68. Label: 13

**Brands Include** *Laxidex*, *Lactugal*, *Movicol*, *Molaxole*

**Cautions** patients with cardiovascular impairment should not take more than 2 sachets in any 1 hour

**Dose** chronic constipation, **ADULT** and **CHILD** over 12 years, 1–3 sachets daily in divided doses usually for up to 2 weeks; contents of each sachet dissolved in half a glass (approx. 125 mL) of water; maintenance, 1–2 sachets daily

**Faecal impaction**, **ADULT** and **CHILD** over 12 years, 8 sachets daily dissolved in 1 litre of water and drunk within 6 hours, usually for max. 3 days

After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

**Movicol** (Norgine)**

**Oral powder**, macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet, net price 20-sachet pack (lime and lemon flavour) = £4.45, 30-sachet pack (lime- and lemon- or chocolate- or plain-flavoured) = £6.68, 50–sachet pack (lime- and lemon- or plain-flavoured) = £11.13. Label: 13

**Note** Amount of potassium chloride varies according to flavour of **Movicol** as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 50.2 mg/sachet;

**LACTULOSE**

**Indications** constipation (may take up to 48 hours to act), hepatic encephalopathy (portal systemic encephalopathy)

**Cautions** lactose intolerance; **interactions**: Appendix 1 (lactulose)

**Contra-indications** galactosaemia, intestinal obstruction

**Pregnancy** not known to be harmful; see also **Pregnancy**, p. 67
1.6.4 Osmotic laxatives

**BNF 61**

MAGNESIUM SALTS

**Indications** see under preparations below

**Cautions** elderly and debilitated; see also notes above; **Interactions**: Appendix 1 (antacids)

**Contra-indications** acute gastro-intestinal conditions

**Hepatic impairment** avoid in hepatic coma if risk of renal failure

**Renal impairment** avoid or reduce dose; increased risk of toxicity

**Side-effects** colic

- See preparations

- **Magnesium hydroxide**

  **Magnesium Hydroxide Mixture, BP**

  Aqueous suspension containing about 8% hydrated magnesium oxide. Do not store in cold place

  **Dose** constipation, 30–45 mL with water at bedtime when required; **CHILD** 3–12 years, 5–10 mL with water at bedtime when required

  **Magnesium hydroxide with liquid paraffin**

  **Liquid Paraffin and Magnesium Hydroxide Oral Emulsion, BP**

  Oral emulsion, 25% liquid paraffin in aqueous suspension containing 6% hydrated magnesium oxide

  **Dose** constipation, 5–20 mL when required

  **Note** Liquid paraffin and magnesium hydroxide preparations on sale to the public include: Milpar® *rexef.*

  **Magnesium sulphate**

  **Magnesium Sulphate**

  **Label**: 13, 23

  **Dose** rapid bowel evacuation (acts in 2–4 hours) 5–10 g in a glass of water preferably before breakfast

  **Note** Magnesium sulphate is on sale to the public as Epsom Salts

  **Bowel cleansing preparations**

  **Section 1.6.5**

  **PHOSPHATES (RECTAL)**

  **Indications** rectal use in constipation; bowel evacuation before abdominal radiological procedures, endoscopy, and surgery

  **Cautions** elderly and debilitated; with enema, electrolyte disturbances, congestive heart failure, ascites, uncontrolled hypertension, maintain adequate hydration

  **Contra-indications** acute gastro-intestinal conditions (including gastro-intestinal obstruction, inflammatory bowel disease, and conditions associated with increased colonic absorption)

  **Renal impairment** use enema with caution

  **Side-effects** local irritation; with enema, electrolyte disturbances

  **Dose**

  - See under preparations

  **Carbalax®** (Chemidex)

  **Suppositories**, sodium acid phosphate (anhydrous) 1.3 g, sodium bicarbonate 1.08 g, net price £2.01

  **Dose** constipation, **ADULT** and **CHILD** over 12 years, 1 suppository, inserted 30 minutes before evacuation required; moisten with water before use

  **Fleet® Ready-to-use Enema** (Casen-Fleet)

  **Enema**, sodium acid phosphate 21.4 g, sodium phosphate 9.4 g/118 mL; net price £0.67 (delivers 118 mL dose) with standard tube = £5p

  **Dose** **ADULT** and **CHILD** (but see section 1.6) over 12 years, 118 mL; **CHILD** 3–12 years, on doctor’s advice only (under 3 years not recommended)

  **Phosphates Enema BP Formula B**

  **Enema**, sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL. Net price £0.98 (with long rectal tube = £3.98)

  **Note** Enema BP Formula B with 118 mL of water required

  **Dose** 128 mL; **CHILD** (but see section 1.6) over 3 years, reduced according to body weight see **BNF** for **Children**

  **SODIUM CITRATE (RECTAL)**

  **Indications** rectal use in constipation

  **Cautions** elderly and debilitated; see also notes above

  **Contra-indications** acute gastro-intestinal conditions

  **Dose**

  - See under preparations

  **Micoletz Micro-enema®** (Pinewood)

  **Enema**, sodium citrate 450 mg, sodium lauryl sulphocetate 45 mg, glycerol 625 mg, together with potassium sorbate and sorbitol in a viscous solution,
in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = £3.98.

**Dose**

- **ADULT** and **CHILD** over 3 years, 5–10 mL (see section 1.6).

**Micralax Micro-enema®** (UCB Pharma)

**Enema**, sodium citrate 450 mg, sodium alkylphosphatase 45 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = £4.1p.

**Dose**

- **ADULT** and **CHILD** over 3 years, 5 mL (see section 1.6).

**Relaxit Micro-enema®** (Crawford)

**Enema**, sodium citrate 450 mg, sodium laureyl sulphate 75 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = £3.2p.

**Dose**

- **ADULT** and **CHILD** (but see section 1.6) 5 mL (insert only half nozzle length in child under 3 years).

### 1.6.5 Bowel cleansing preparations

Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are not treatments for constipation.

**Caution**: Renal function should be measured before starting. Bowel cleansing preparations should be used with caution in patients with fluid and electrolyte disturbances. Hypovolaemia should be corrected before administration of bowel cleansing preparations. Adequate hydration should be maintained during treatment. Bowel cleansing preparations should be used with caution in patients with an impaired gag reflex, reduced levels of consciousness, or debilitation. They should also be used with caution in patients with an impaired gag reflex, reduced levels of consciousness, or possibility of regurgitation or aspiration. Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired.

**Contra-indications**: Bowel cleansing preparations are contra-indicated in patients with gastro-intestinal obstruction or perforation, gastric retention, acute severe colitis, or toxic megacolon.

**Side-effects**: Side-effects of bowel cleansing preparations include nausea, vomiting, abdominal pain (usually transient—reduced by taking more slowly), and abdominal distention. Less frequent side-effects include headache, dizziness, dehydration, and electrolyte disturbances.

**MAGNESIUM CITRATE**

-Reconstitution of a sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate.

**Indications**: see preparations

**Cautions**: see notes above

**Contra-indications**: see notes above

**Hepatic impairment**: avoid in hepatic coma if risk of renal failure

**Renal impairment**: avoid if eGFR less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia

**Pregnancy**: caution

**Breast-feeding**: caution

**Side-effects**: see notes above

**Dose**: see preparations

---

**BNF 61**

**1.6.5 Bowel cleansing preparations**

Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are not treatments for constipation.

**Caution**: Renal function should be measured before starting. Bowel cleansing preparations should be used with caution in patients with fluid and electrolyte disturbances. Hypovolaemia should be corrected before administration of bowel cleansing preparations. Adequate hydration should be maintained during treatment. Bowel cleansing preparations should be used with caution in patients with an impaired gag reflex, reduced levels of consciousness, or debilitation. They should also be used with caution in patients with an impaired gag reflex, reduced levels of consciousness, or possibility of regurgitation or aspiration. Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired.

**Contra-indications**: Bowel cleansing preparations are contra-indicated in patients with gastro-intestinal obstruction or perforation, gastric retention, acute severe colitis, or toxic megacolon.

**Side-effects**: Side-effects of bowel cleansing preparations include nausea, vomiting, abdominal pain (usually transient—reduced by taking more slowly), and abdominal distention. Less frequent side-effects include headache, dizziness, dehydration, and electrolyte disturbances.

**MACROGOLS**

- **Indications**: see notes above
- **Cautions**: see notes above; also heart failure; acute inflammatory bowel disease
- **Contra-indications**: see notes above
- **Pregnancy**: manufacturers advise use only if essential—no information available
- **Breast-feeding**: manufacturers advise use only if essential—no information available
- **Side-effects**: see notes above; also fatigue, sleep disturbances, and anal discomfort

---

**Klean-Prep®** (Norgine)

**Oral powder**, sugar-free, macrocol ‘3350’ (polyethylene glycol ‘3350’) 59 g, anhydrous sodium sulphate 5.685 g, sodium bicarbonate 1.685 g, sodium chloride 1.465 g, potassium chloride 743 mg/sachet, net price 4 sachets = £8.23. Label: 10, patient information leaflet, 13, counselling.

**Exipients**: include aspartame (section 9.4.1) 1 sachet when reconstituted with 1 litre of water provides Na⁺ 125 mmol, K⁺ 10 mmol, Cl⁻ 35 mmol, HCO₃⁻ 20 mmol.

**Dose**: bowel evacuation before surgery, colonoscopy, or radiological examination, a glass (approx. 250 mL) of reconstituted solution every 10–15 minutes, or by nasogastric tube 20–30 mL/minute, starting on the day before procedure until 4 litres have been consumed; alternatively, administration may be divided into two (2 litres of reconstituted solution taken on the evening before procedure and 2 litres of reconstituted solution taken on the morning of procedure). Treatment can be stopped if bowel motions become watery and clear. To facilitate gastric emptying, domperidone or metoclopramide may be given 30 minutes before starting; **CHILD** 12–18 years see BNF for Children.

**Counselling**: 1 sachet should be reconstituted with 1 litre of water. Flavouring such as clear fruit cordials may be added if required. Solid food should not be taken for at least 2 hours before starting treatment. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

**Moviprep®** (Norgine)

**Oral powder**, lemon- or orange-flavoured, Sachet A (containing macrocol ‘3350’ (polyethylene glycol ‘3350’) 100 g, anhydrous sodium sulphate 7.5 g, sodium chloride 2.691 g, potassium chloride 1.015 g) and Sachet B (containing ascorbic acid 4.7 g, sodium ascorbate 5.9 g), net price 4-sachet pack (2 each of sachet A and B) = £9.87. Label: 10, patient information leaflet, 13, counselling, see below.

**Exipients**: include aspartame (section 9.4.1) 1 pair of sachets (A+B) when reconstituted with 1 litre of water provides Na⁺ 181.6 mmol (Na⁺ 56.2 mmol absorbable), K⁺ 14.2 mmol, Cl⁻ 59.8 mmol.

**Contra-indications**: G6PD deficiency.

**Renal impairment**: caution if eGFR less than 30 mL/minute.

**Dose**: bowel evacuation for surgery, colonoscopy or radiological examination, **ADULT** over 18 years, 2 litres of reconstituted solution on the evening before procedure or 1 litre of reconstituted solution on the evening before procedure and 1 litre of reconstituted solution early on the morning of procedure; treatment should be completed at least 1 hour before colonoscopy. **Counselling**: One pair of sachets (A and B) should be reconstituted in 1 litre of water and taken over 1–2 hours. Solid food should not be taken during treatment until procedure completed. 1 litre of other clear fluid should also be taken during treatment. Treatment can be stopped if bowel motions become watery and clear.

---

**BNF 61 1.6.5 Bowel cleansing preparations 73**
1.6.6 Peripheral opioid-receptor antagonists

Methylnaltrexone is a peripherally acting opioid-receptor antagonist that is licensed for the treatment of opioid-induced constipation in patients receiving palliative care, when response to other laxatives is inade-
1.6.7 5HT₄-receptor agonists

Prucalopride is a selective serotonin 5HT₄-receptor agonist with prokinetic properties. It is licensed for the treatment of chronic constipation in women, when other laxatives have failed to provide an adequate response. Headache and gastro-intestinal symptoms (including abdominal pain, nausea, and diarrhoea) are the most frequent side-effects. The side-effects generally occur at the start of treatment and are usually transient.

1.7 Local preparations for anal and rectal disorders

1.7.1 Soothing haemorrhoidal preparations

Soothing preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hamamelis may give symptomatic relief in haemorrhoids. Many proprietary preparations also contain lubricants, vasoconstrictors, or mild antiseptics.

Local anaesthetics are used to relieve pain associated with haemorrhoids and pruritus ani but good evidence...
is lacking. Lidocaine ointment (section 15.2) is used before emptying the bowel to relieve pain associated with anal fissure. Alternative local anaesthetics include tetracaine, cinchocaine (dibucaine), and pramocaine (pramoxine), but they are more irritant. Local anaesthetic ointments can be absorbed through the rectal mucosa therefore excessive application should be avoided, particularly in infants and children. Preparations containing local anaesthetics should be used for short periods only (no longer than a few days) since they may cause sensitisation of the anal skin.

1.7.2 Compound haemorrhoidal preparations with corticosteroids

Corticosteroids are often combined with local anaesthetics and soothing agents in preparations for haemorrhoids. They are suitable for occasional short-term use after exclusion of infections, such as herpes simplex; prolonged use can cause atrophy of the anal skin. See section 13.4 for general comments on topical corticosteroids and section 1.7.1 for comment on local anaesthetics.

Children

Haemorrhoids in children are rare. Treatment is usually symptomatic and the use of a locally applied cream is appropriate for short periods; however, local anaesthetics can cause stinging initially and this applied cream is appropriate for short periods; however, children may aggravate the child’s fear of defaecation.

Anugescic-HC® (Pfizer) (Full)

Cream, benzyl benzoate 1.2%, bismuth oxide 0.875%, hydrocortisone acetate 0.5%, Peru balsam 1.85%, pramocaine hydrochloride 1%, zinc oxide 12.35%. Net price 30 g (with rectal nozzle) = £3.71

Dose apply night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

Suppositories, buff, benzyl benzoate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydrocortisone acetate 5 mg, Peru balsam 49 mg, pramocaine hydrochloride 27 mg, zinc oxide 296 mg, net price 12 = £2.69

Dose insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

Anusol-HC® (McNeil) (Full)

Ointment, benzyl benzoate 1.25%, bismuth oxide 0.875%, bismuth subgallate 2.25%, hydrocortisone acetate 0.25%, Peru balsam 1.875%, zinc oxide 10.75%. Net price 30 g (with rectal nozzle) = £3.29

Dose apply night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

Note A proprietary brand (Anusol Plus HC® ointment) is on sale to the public

Suppositories, benzyl benzoate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydrocortisone acetate 10 mg, Peru balsam 49 mg, zinc oxide 296 mg. Net price 12 = £2.31

Dose insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

Note A proprietary brand (Anusol Plus HC® suppositories) is on sale to the public

Perinal® (Dermal)

Spray application, hydrocortisone 0.2%, lidocaine hydrochloride 1%. Net price 30-ML pack = £6.11

Dose ADULT and CHILD over 14 years, spray once over the affected area up to 3 times daily; do not use for longer than 7 days without medical advice; CHILD under 14 years on medical advice only

Proctofoam HC® (Meda) (Full)

Foam in aerosol pack, hydrocortisone acetate 1%, pramocaine hydrochloride 1%. Net price 21.2-g pack (approx. 40 applications) with applicator = £5.06

Dose haemorrhoids and proctitis, 1 applicatorful (4-6 mg hydrocortisone acetate, 4-6 mg pramocaine hydrochloride) by rectum 2–3 times daily and after each bowel movement (max. 4 times daily), do not use for longer than 7 days; CHILD not recommended

Proctosedyl® (Sanofi-Aventis) (Full)

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g = £10.34 (with cannula)

Dose apply morning and night and after a bowel movement, externally or by rectum; do not use for longer than 7 days

Suppositories, cinchocaine (dibucaine) hydrochloride 5 mg, hydrocortisone 5 mg. Net price 12 = £4.66

Dose insert 1 suppository night and morning and after a bowel movement, do not use for longer than 7 days

Scheriproct® (Bayer Schering) (Full)

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, prednisolone hexanoate 0.19%. Net price 30 g = £2.94

Dose apply twice daily for 5–7 days (3–4 times daily on 1st day if necessary), then once daily for a few days after symptoms have cleared

Suppositories, cinchocaine (dibucaine) hydrochloride 1 mg, prednisolone hexanoate 1.3 mg. Net price 12 = £1.38

Dose insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily)

Ultraproct® (Meadow) (Full)

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, fluocortolone caproate 0.095%, fluocortolone pivalate 0.092%, net price 30 g (with rectal nozzle) = £4.57

Dose apply twice daily for 5–7 days (3–4 times daily on 1st day if necessary), then once daily for a few days after symptoms have cleared

Suppositories, cinchocaine (dibucaine) hydrochloride 1 mg, fluocortolone caproate 630 micrograms, fluocortolone pivalate 610 micrograms, net price 12 = £2.15

Dose insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily) then 1 suppository every other day for 1 week

Uniorid-HC® (Chemidex) (Full)

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g (with applicator) = £4.23

Dose ADULT and CHILD over 12 years, apply twice daily and after a bowel movement, externally or by rectum; do not use for longer than 7 days; CHILD under 12 years on medical advice only

Suppositories, cinchocaine (dibucaine) hydrochloride 5 mg, hydrocortisone 5 mg. Net price 12 = £1.91

Dose ADULT and CHILD over 12 years, insert 1 suppository twice daily and after a bowel movement; do not use for longer than 7 days
XYLOPROCT® (Astra Zeneca) (p. 1G)
Ointment (water-miscible), aluminium acetate 3.5%, hydrocortisone acetate 0.275%, lidocaine 5%, zinc oxide 18%, net price £20.0 (with applicator) = £2.26
Dose apply several times daily; short-term use only

### 1.7.3 Rectal sclerosants

Oily phenol injection is used to inject haemorrhoids particularly when unprolapsed.

**PHENOL**

**Indications** see notes above

**Side-effects** irritation, tissue necrosis

**Oily Phenol Injection, BP** (p. 30
phenol 5% in a suitable fixed oil. Net price 5-mL amp = £4.65
Dose 2–3 mL into the submucosal layer at the base of the pile; several injections may be given at different sites, max. total injected 10 mL at any one time

### 1.7.4 Management of anal fissures

The management of anal fissures requires stool softening by increasing dietary fibre in the form of bran or by using a bulk-forming laxative. Short-term use of local anaesthetic preparations may help (section 1.7.1). If these measures are inadequate, the patient should be referred for specialist treatment in hospital. The use of a topical nitrate (e.g. glyceryl trinitrate 0.4% ointment) may be considered. Before considering surgery, topical diltiazem 2% may be used twice daily [unlicensed indication] in patients with chronic anal fissures unresponsive to topical nitrate.

The Scottish Medicines Consortium (p. 4) has advised (January 2008) that glyceryl trinitrate 0.4% ointment (Rectogesic®) is not recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

**GLYCERYL TRINITRATE**

**Indications** anal fissure; angina, left ventricular failure (section 2.6.1); extravasation (section 10.3)

**Cautions** section 2.6.1

**Contra-indications** section 2.6.1

**Hepatic impairment** section 2.6.1

**Renal impairment** section 2.6.1

**Pregnancy** section 2.6.1

**Breast-feeding** section 2.6.1

**Side-effects** section 2.6.1; also diarrhoea, burning, itching, and rectal bleeding

**Dose**

- see preparations

**Rectogesic®** (ProStrakan) (p. 1G)

**Rectal ointment**, glyceryl trinitrate 0.4%, net price 30 g = £34.80

Excipients include lanolin, propylene glycol

**Dose** ADULT over 18 years, apply 2.5 cm of ointment to anal canal every 12 hours until pain stops; max. duration of use 8 weeks

**Note** 2.5 cm of ointment contains glyceryl trinitrate 1.5 mg; discard tube 8 weeks after first opening

---

**1.8 Stoma care**

Prescribing for patients with stoma calls for special care. The following is a brief account of some of the main points to be borne in mind.

**Enteric-coated and modified-release preparations are unsuitable**, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

**Laxatives** Enemas and washouts should not be prescribed for patients with an ileostomy as they may cause rapid and severe loss of water and electrolytes.

Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs (section 1.6.1) may be tried. If they are insufficient, as small a dose as possible of senna (section 1.6.2) should be used.

**Antidiarrhoeals** Drugs such as loperamide, codeine phosphate, or co-phenotrope (diphenoxylate with atropine) are effective. Bulk-forming drugs (section 1.6.1) may be tried but it is often difficult to adjust the dose appropriately.

**Antibacterials** should not be given for an episode of acute diarrhoea.

**Antacids** The tendency to diarrhoea from magnesium salts or constipation from aluminium salts may be increased in these patients.

**Diuretics** Diuretics should be used with caution in patients with an ileostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic (see section 2.2.3).

**Digoxin** Patients with a stoma are particularly susceptible to hypokalaemia if on digoxin therapy and potassium supplements or a potassium-sparing diuretic may be advisable (for comment see section 9.2.1.1).

**Potassium supplements** Liquid formulations are preferred to modified-release formulations (see above).

**Analgesics** Opioid analgesics (see section 4.7.2) may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required paracetamol is usually suitable but anti-inflammatory analgesics may cause gastric irritation and bleeding.

**Iron preparations** Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated a modified-release preparation should be used. Modified-release preparations are unsuitable for the reasons given above.

**Care of stoma** Patients are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.
1.9 Drugs affecting intestinal secretions

1.9.1 Drugs affecting biliary composition and flow

The use of laparoscopic cholecystectomy and of endoscopic biliary techniques has limited the place of the bile acid ursodeoxycholic acid in gallstone disease. Ursodeoxycholic acid is suitable for patients with unimpaired gall bladder function, small or medium-sized radiolucent stones, and whose mild symptoms are not amenable to other treatment; it should be used cautiously in those with liver disease (but see below). Patients should be given dietary advice (including avoidance of excessive cholesterol and calories) and they require radiological monitoring. Long-term prophylaxis may be needed after complete dissolution of the gallstones has been confirmed because they may recur in up to 25% of patients within one year of stopping treatment.

Ursodeoxycholic acid is also used in primary biliary cirrhosis; liver tests improve in most patients but the effect on overall survival is uncertain.

**URSODEOXYCHOLIC ACID**

**Indications** see under Dose and under preparations

**Cautions** see notes above; **Interactions:** Appendix 1 (ursodeoxycholic acid)

**Contra-indications** radio-opaque stones, non-functioning gall bladder, inflammatory diseases and other conditions of the small intestine, colon and liver which interfere with entero-hepatic circulation of bile salts

**Hepatic impairment** avoid in chronic liver disease (but used in primary biliary cirrhosis)

**Pregnancy** no evidence of harm but manufacturer advises avoid

**Breast-feeding** not known to be harmful but manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhoea; gallstone calcification; pruritus

**Dose**

- Dissolution of gallstones, 8–12 mg/kg daily as a single dose at bedtime or in two divided doses, for up to 2 years; treatment is continued for 3–4 months after stones dissolve
- Primary biliary cirrhosis, see under Ursofalk®

**Ursodeoxycholic Acid (Non-proprietary)** [BNF]

- **Tablets**, ursodeoxycholic acid 150 mg, net price 60-tab pack = £20.48. Label: 21
- **Capsules**, ursodeoxycholic acid 250 mg, net price 60-cap pack = £38.86. Label: 21

**Destolit®** (Norgine) [BNF]

- **Tablets**, scored, ursodeoxycholic acid 150 mg, net price 60-tab pack = £17.67. Label: 21

**Urdox®** (Wockhardt) [BNF]

- **Tablets**, f/c, ursodeoxycholic acid 300 mg, net price 60-tab pack = £26.50. Label: 21

**Ursofalk®** (Dr Falk) [BNF]

- **Capsules**, ursodeoxycholic acid 250 mg, net price 60-cap pack = £30.17, 100-cap pack = £31.88. Label: 21

- **Suspension**, sugar-free, ursodeoxycholic acid 250 mg/5 mL, net price 250 mL = £26.98. Label: 21

**Dose**

- Primary biliary cirrhosis, 10–15 mg/kg daily as a single daily dose or in 2–4 divided doses
- Dissolution of gallstones, see Dose, above

**Ursogal®** (Galen) [BNF]

- **Tablets**, scored, ursodeoxycholic acid 150 mg, net price 60-tab pack = £17.05. Label: 21

**Other preparations for biliary disorders**

**A terpene mixture** (Rowacho®) raises biliary cholesterol solubility. It is not considered to be a useful adjunct.

**Rowachol®** (Rowa) [BNF]

- **Capsules**, green, e/c, borneol 5 mg, camphene 5 mg, cineole 2 mg, menthol 32 mg, menthone 6 mg, pinene 17 mg in olive oil. Net price 50-cap pack = £7.35. Label: 22

**Dose** 1–2 capsules 3 times daily before food (but see notes above)

**Interactions:** Appendix 1 (Rowacho®)

1.9.2 Bile acid sequestrants

Colestyramine is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves diarrhoea and pruritus by forming an insoluble complex with bile acids in the intestine. Colestyramine can interfere with the absorption of a number of drugs. Colestyramine is also used in hypercholesterolaemia (section 2.12).

**COLESTYRAMINE** (Cholestyramine)

**Indications** pruritus associated with partial biliary obstruction and primary biliary cirrhosis; diarrhoea associated with Crohn’s disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation; hypercholesterolaemia (section 2.12)

**Cautions** section 2.12

**Contra-indications** section 2.12

**Pregnancy** section 2.12

**Breast-feeding** section 2.12

**Side-effects** section 2.12

**Dose**

- Pruritus, 4–8 g daily in a suitable liquid; **CHILD** 1–18 years see BNF for Children
- Diarrhoea, initially 4 g daily increased by 4 g at weekly intervals to 12–24 g daily in a suitable liquid in 1–4
1.9.3 Aprotinin

Aprotinin is no longer used for the treatment of acute pancreatitis.

1.9.4 Pancreatin

Supplements of pancreatin are given by mouth to compensate for reduced or absent exocrine secretion in cystic fibrosis, and following pancreatectomy, gatroctomy, or chronic pancreatitis. They assist the digestion of starch, fat, and protein. Pancreatin may also be necessary if a tumour (e.g. pancreatic cancer) obstructs outflow from the pancreas.

Pancreatin is inactivated by gastric acid therefore pancreatin preparations are best taken with food (or immediately before or after food). Gastric acid secretion may be reduced by giving cinmetidine or ranitidine an hour beforehand (section 1.3). Concurrent use of antacids also reduces gastric acidity. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Higher-strength preparations are also available [important: see CSM advice below].

Since pancreatin is also inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; the resulting mixtures should not be kept for more than one hour.

Dosage is adjusted according to size, number, and consistency of stools, so that the patient thrives; extra allowance will be needed if snacks are taken between meals.

Pancreatin can irritate the perioral skin and buccal mucosa if retained in the mouth, and excessive doses can cause perianal irritation. The most frequent side-effects are gastro-intestinal, including nausea, vomiting, and abdominal discomfort; hyperuricaemia and hyperuricosuria have been associated with very high doses. Hypersensitivity reactions occur occasionally and may affect those handling the powder.

**PANCREATIN**

**Indications** see above

**Cautions** see above and (for higher-strength preparations) see below

**Pregnancy** not known to be harmful

**Side-effects** see above and (for higher-strength preparations) see below

**Dose**

- See preparations

**Creon® 10 000 (Solvay)**

**Capsules**, brown/clear, enclosing buff-coloured e/c granules of pancreatin (pork), providing: protease 1400 units, lipase 10 000 units, amylase 8000 units. Net price 100-cap pack = £12.93. Counselling, see dose

**Dose**

- **ADULT** and **CHILD** initially 1–2 capsules with each meal either taken whole or mixed with fluid or soft food (then swallowed immediately without chewing)

**Creon® Micro (Solvay)**

**Gastro-resistant granules**, brown, pancreatin (pork), providing: protease 200 units, lipase 3000 units, amylase 3600 units per 100 mg, net price 20 g = £13.50

Counselling, see dose

**Dose**

- **ADULT** and **CHILD** initially 100 mg with each meal either taken whole or mixed with acidic fluid or soft food (then swallowed immediately without chewing)

**Nutrizym 10® (Merck Serono)**

**Capsules**, red/yellow, enclosing e/c minitablets of pancreatin (pork), providing minimum of: protease 500 units, lipase 10 000 units, amylase 9000 units. Net price 100 = £14.47. Counselling, see dose

**Dose**

- **ADULT** and **CHILD** 1–2 capsules with meals and 1 capsule with snacks, swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing); higher doses may be required according to response

**Pancrex® (Paines & Byrne)**

**Granules**, pancreatin (pork), providing minimum of: protease 300 units, lipase 5000 units, amylase 4000 units/g. Net price 300 g = £20.39. Label: 25, counselling, see dose

**Dose**

- **ADULT** and **CHILD** 5–10 g just before meals washed down or mixed with a little milk or water

**Pancrex V® (Paines & Byrne)**

**Capsules**, pancreatin (pork), providing minimum of: protease 430 units, lipase 8000 units, amylase 9000 units. Net price 300-cap pack = £15.80. Counselling, see dose

**Dose**

- **ADULT** and **CHILD** over 1 year 2–6 capsules with each meal, swallowed whole or sprinkled on food; **INFANT** up to 1 year contents of 1–2 capsules mixed with feeds

**Capsules ‘125’,** pancreatin (pork), providing minimum of: protease 160 units, lipase 2950 units, amylase 3300 units, net price 300-cap pack = £9.72. Counselling, see dose

**Dose**

- **NEONATE** contents of 1–2 capsules mixed with feeds

**Tablets**, e/c, pancreatin (pork), providing minimum of: protease 110 units, lipase 1900 units, amylase 1700 units. Net price 300-tab pack = £4.51. Label: 5, 25, counselling, see dose

**Dose**

- **ADULT** and **CHILD** 5–15 tablets before each meal

**Tablets forte, e/c, pancreatin (pork), providing minimum of: protease 330 units, lipase 5600 units, amylase 5500 units. Net price 300-tab pack = £13.74. Label: 5, 25, counselling, see dose

**Dose**

- **ADULT** and **CHILD** 6–10 tablets before each meal

**Powder**, pancreatin (pork), providing minimum of: protease 1400 units, lipase 25 000 units, amylase 30 000 units/g. Net price 300 g = £24.28. Counselling, see dose

**Dose**

- **ADULT** and **CHILD** over 1 month, 0.5–2 g before each meal, washed down or mixed with liquid; **NEONATE** 250–500 mg with each feed
Higher-strength preparations

The high-strength pancreatin preparations Nutrizym 22® and Pancrease HL® have been associated with the development of large bowel strictures (fibrosing colonopathy) in children with cystic fibrosis aged between 2 and 13 years. No association was found with Creon® 25 000 and Creon® 40 000. The following is recommended:

- Pancrease HL® and Nutrizym 22® should not be used in children aged 15 years or less with cystic fibrosis;
- the total dose of pancreatic enzyme supplements used in patients with cystic fibrosis should not usually exceed 10 000 units of lipase per kg body-weight daily;
- if a patient on any pancreatin preparation develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

Possible risk factors are gender (boys at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years. Counselling It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

Creon® 25 000 (Solvay)
Capsules, orange/clear, enclosing brown-coloured e/c pellets of pancreatin (pork), providing: protease (total) 1000 units, lipase 25 000 units, amylase 18 000 units, net price 100-cap pack = £28.25. Counselling, see above and under dose

Dose
ADULT and CHILD initially 1 capsule with meals either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing)

Creon® 40 000 (Solvay)
Capsules, brown/clear, enclosing brown-coloured e/c granules of pancreatin (pork), providing: protease (total) 1600 units, lipase 40 000 units, amylase 25 000 units, net price 100-cap pack = £60.00. Counselling, see above and under dose

Dose
ADULT and CHILD initially 1–2 capsules with meals either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing)

Nutrizym 22® (Merck Serono)
Capsules, red/yellow, enclosing e/c minitablets of pancreatin (pork), providing minimum of: protease 1100 units, lipase 22 000 units, amylase 19 800 units. Net price 100-cap pack = £33.33. Counselling, see above and under dose

Dose
ADULT and CHILD over 15 years, 1–2 capsules with meals and 1 capsule with snacks, swallowed whole or contents mixed with water or soft food (then swallowed immediately without chewing)

Pancrease HL® (Janssen-Cilag)
Capsules, enclosing light brown e/c minitablets of pancreatin (pork), providing minimum of: protease 1250 units, lipase 25 000 units, amylase 22 500 units. Net price 100 = £31.70. Counselling, see above and under dose

Dose
ADULT and CHILD over 15 years, 1–2 capsules during each meal and 1 capsule with snacks swallowed whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

2.1 Positive inotropic drugs

2.1.1 Cardiac glycosides 124

2.1.1 Cardiac glycosides

Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

Digoxin is most useful for controlling ventricular response in persistent and permanent atrial fibrillation and atrial flutter (section 2.3.1). For reference to the role of digoxin in heart failure, see section 2.5.5.
2 Cardiovascular system

For management of atrial fibrillation the maintenance dose of digoxin can usually be determined by the ventricular rate at rest, which should not usually be allowed to fall persistently below 60 beats per minute.

Digoxin is now rarely used for rapid control of heart rate (see section 2.3 for the management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be divided to avoid nausea); renal function is the most important determinant of digoxin dosage.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Digoxin should be used with special care in the elderly, who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium-sparring diuretic or, if necessary, potassium supplementation.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage (see below).

### Digoxin

**Indications** heart failure (see also section 2.5.5), supraventricular arrhythmias (particularly atrial fibrillation and atrial flutter; see also section 2.3.2)

**Cautions** recent myocardial infarction; sick sinus syndrome; thyroid disease; reduce dose in the elderly; severe respiratory disease; hypokalaemia, hypomagnesaemia, hypercalcemia, and hypoxia (risk of digitalis toxicity); monitor serum electrolytes and renal function; avoid rapid intravenous administration (risk of hypertension and reduced coronary flow); interactions: Appendix 1 (cardiac glycosides)

**Contra-indications** intermittent complete heart block, second degree AV block; supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome; ventricular tachycardia or fibrillation; hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but use with caution); myocarditis; constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution)

**Renal impairment** reduce dose and monitor plasma-digoxin concentration; toxicity increased by electrolyte disturbances

**Pregnancy** may need dosage adjustment

**Breast-feeding** amount too small to be harmful

**Side-effects** see notes above; also nausea, vomiting, diarrhoea; arrhythmias, conduction disturbances; dizziness; blurred or yellow vision; rash, eosinophilia; less commonly depression; very rarely anorexia, intestinal ischaemia and necrosis, psychosis, apathy, confusion, headache, fatigue, weakness, gynaecomastia on long-term use, and thrombocytopenia

**Dose**
- Rapid digitalisation, for atrial fibrillation or flutter, by mouth, 0.75–1.5 mg over 24 hours in divided doses
- Maintenance, for atrial fibrillation or flutter, by mouth, according to renal function and initial loading dose; usual range 125–250 micrograms daily
- Heart failure (for patients in sinus rhythm), by mouth, 62.5–125 micrograms once daily
- Emergency loading dose, for atrial fibrillation or flutter, by intravenous infusion (but rarely necessary), 0.75–1 mg over at least 2 hours (see also Cautions) then maintenance dose by mouth on the following day

**Note** The above doses may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks. Digoxin doses in the BNF may differ from those in product literature. For plasma concentration monitoring, blood should ideally be taken at least 6 hours after a dose

### Digoxin

**Digoxin (Non-proprietary)**
- **Tablets**, digoxin 62.5 micrograms, net price 28-tab pack = £2.03; 125 micrograms, 28-tab pack = £1.12; 250 micrograms, 28-tab pack = £1.13
- **Injection**, digoxin 250 micrograms/mL, net price 2-mL amp = 70p
- **Paediatric injection**, digoxin 100 micrograms/mL
  - Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

**Lanoxin® (Aspen)**
- **Tablets**, digoxin 62.5 micrograms, net price 500-tab pack = £8.09; 250 micrograms (scored), 500-tab pack = £8.09
- **Injection**, digoxin 250 micrograms/mL, net price 2-mL amp = 66p

**Lanoxin-PG® (Aspen)**
- **Tablets**, blue, digoxin 62.5 micrograms, net price 500-tab pack = £8.09
- **Elixir**, yellow, digoxin 50 micrograms/mL. Do not dilute, measure with pipette. Net price 60 mL = £5.35. Counselling, use of pipette

### Digoxin-specific antibody

Digoxin-specific antibody fragments are indicated for the treatment of known or strongly suspected digoxin or other cardiac glycoside overdosage when measures beyond the withdrawal of the cardiac glycoside and correction of any electrolyte abnormalities are felt to be necessary (see also notes above).

**Digibind® (GSK)**
- **Injection**, powder for preparation of infusion, digoxin-specific antibody fragments (Fab) 36 mg, net price per vial = £93.97 (hosp. and poisons centres only)
- **Dose** consult product literature
2.1.2 Phosphodiesterase type-3 inhibitors

Enoximone and milrinone are phosphodiesterase type-3 inhibitors that exert most of their effect on the myocardium. Sustained haemodynamic benefit has been observed after administration, but there is no evidence of any beneficial effect on survival.

**Enoximone**

**Indications** congestive heart failure where cardiac output reduced and filling pressures increased

**Cautions** heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction; monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count, hepatic enzymes; avoid extravasation; **interactions:** Appendix 1 (phosphodiesterase type-3 inhibitors)

**Hepatic impairment** dose reduction may be required

**Renal impairment** consider dose reduction

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** ectopic beats; less frequently ventricular tachycardia, supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias); hypotension; also headache, insomnia, nausea and vomiting, diarrhea; occasionally, chills, oliguria, fever, urinary retention; upper and lower limb pain

**Dose**
- By slow intravenous injection (rate not exceeding 12.5 mg/minute), diluted before use, initially 0.5–1 mg/kg, then 500 micrograms/kg every 30 minutes until satisfactory response or total of 3 mg/kg given; maintenance, initial dose of up to 3 mg/kg may be repeated every 3–6 hours as required
- By intravenous infusion, initially 90 micrograms/kg/minute over 10–30 minutes, followed by continuous or intermittent infusion of 5–20 micrograms/kg/minute Total dose over 24 hours should not usually exceed 24 mg/kg

**Perfan** (INCA-Pharm) Injection, enoximone 5 mg/mL. For dilution before use. Net price 20-mL amp = £15.02

**Note** Plastic apparatus should be used; crystal formation if glass used

**Milrinone**

**Indications** short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction); acute heart failure, including low output states following heart surgery

**Cautions** see under Enoximone; also correct hypokalaemia; **interactions:** Appendix 1 (phosphodiesterase type-3 inhibitors)

**Renal impairment** reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m²—consult product literature for details

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** ectopic beats, ventricular tachycardia, supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias), hypotension; headache; less commonly ventricular fibrillation, chest pain, tremor, hypokalaemia, thrombocytopenia; very rarely bronchospasm, anaphylaxis, and rash

**Dose**
- By intravenous injection over 10 minutes, either undiluted or diluted before use, 50 micrograms/kg followed by intravenous infusion at a rate of 375–750 nanograms/kg/minute, usually for up to 12 hours following surgery or for 48–72 hours in congestive heart failure; max. daily dose 1.13 mg/kg

**Primacor** (Sanofi-Aventis) Injection, milrinone (as lactate) 1 mg/mL, net price 10-mL amp = £16.61

2.2 Diuretics

2.2.1 Thiazides and related diuretics

2.2.2 Loop diuretics

2.2.3 Potassium-sparing diuretics and aldosterone antagonists

2.2.4 Potassium-sparing diuretics with other diuretics

2.2.5 Osmotic diuretics

2.2.6 Mercurial diuretics

2.2.7 Carbonic anhydrase inhibitors

2.2.8 Diuretics with potassium

Thiazides (section 2.2.1) are used to relieve oedema due to chronic heart failure (section 2.5.5) and, in lower doses, to reduce blood pressure.

Loop diuretics (section 2.2.2) are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure (section 2.5.5).

Combination diuretic therapy may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

Elderly Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

**Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics (section 2.2.5) avoids the need to take potassium supplements.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic
Thiazides and related diuretics are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of hypertension a low dose of a thiazide, e.g. bendroflumethiazide 2.5 mg daily, produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. For reference to the use of thiazides in chronic heart failure see section 2.5.5.

**Bendroflumethiazide** is widely used for mild or moderate heart failure and for hypertension—alone in the treatment of mild hypertension or with other drugs in more severe hypertension.

**Chlortalidone**, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics.

Other thiazide diuretics (including benzthiazide, clopamide, cyclopenthiazide, hydrochlorothiazide, and hydroflumethiazide) do not offer any significant advantage over bendroflumethiazide or chlortalidone.

**Metolazone** is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

**Xipamide** and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

**Cautions** See also section 2.2. Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus. Electrolytes should be monitored, particularly with high doses, long-term use, or in renal impairment. Thiazides and related diuretics should also be used with caution in nephrotic syndrome, hyperaldosteronism, and malnourishment; *interactions*: Appendix 1 (diuretics)

**Contra-indications** Thiazides and related diuretics should be avoided in refractory hypokalaemia, hypernatraemia and hypercalcaemia, symptomatic hyperuricaemia, and Addison’s disease.

**Hepatic impairment** Thiazides and related diuretics should be used with caution in mild to moderate impairment and avoided in severe liver disease. Hypokalaemia may precipitate coma, although hypokalaemia can be prevented by using a potassium-sparing diuretic. There is an increased risk of hypermagnesaemia in alcoholic cirrhosis.

**Renal impairment** Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m² and should be avoided; metolazone remains effective but with a risk of excessive diuresis.

**Pregnancy** Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

**Breast-feeding** The amount of bendroflumethiazide, chlortalidone, cyclopenthiazide, and metolazone present in milk is too small to be harmful; large doses may suppress lactation. For indapamide and xipamide see individual drugs.

**Side-effects** Side-effects of thiazides and related diuretics include mild gastro-intestinal disturbances, postural hypotension, altered plasma-lipid concentrations, metabolic and electrolyte disturbances including hypokalaemia (see also notes above), hyperonatraemia, hypomagnesaemia, hypercalcaemia, hyperglycaemia, hyperchloroemic alkalosis, hyperuricaemia, and gout. Less common side-effects include blood disorders such as agranulocytosis, leucopenia, and thrombocytopenia, and impotence. Pancreatitis, intrahepatic cholestasis, cardiac arrhythmias, headache, dizziness, paraesthesia, visual disturbances, and hypersensitivity reactions (including pneumonitis, pulmonary oedema, photosensitivity, and severe skin reactions) have also been reported.

**BENDROFLUMETHIAZIDE**

**Indications** oedema, hypertension (see also notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- Oedema, initially 5–10 mg daily in the morning or on alternate days; maintenance 5–10 mg 1–3 times weekly
- Hypertension, 2.5 mg daily in the morning; higher doses rarely necessary (see notes above)

**Bendroflumethiazide** (Non-proprietary)

**Tablets**, bendroflumethiazide 2.5 mg, net price 28 = 79p; 5 mg, 28 = 86p

*Brands include Aprono®*
CHLORTALIDONE
(Chlorthalidone)
Indications ascites due to cirrhosis in stable patients (under close supervision), oedema due to nephrotic syndrome, hypertension (see also notes above), mild to moderate chronic heart failure; diabetes insipidus (see section 6.5.2)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above; also rarely jaundice and allergic interstitial nephritis
Dose
• Oedema, up to 50 mg daily
• Hypertension, 25 mg daily in the morning, increased to 50 mg daily if necessary (but see notes above)
• Heart failure, 25–50 mg daily in the morning, increased if necessary to 100–200 mg daily (reduce to lowest effective dose for maintenance)

Hygroton® (Alliance) Tablets, yellow, scored, chlortalidone 50 mg, net price 28-tab pack = £1.64

CYCLOPENTHIAZIDE
Indications oedema, hypertension (see also notes above); heart failure
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above; also rarely depression
Dose
• Oedema, 5–10 mg daily in the morning, increased if necessary to 20 mg daily in resistant oedema, max. 80 mg daily
• Hypertension, initially 5 mg daily in the morning; maintenance 5 mg on alternate days

Navidrex® (Goldshield) Tablets, scored, cyclopenthiazide 500 micrograms, net price 28-tab pack = £1.27
Excipients include gluten
Note May be difficult to obtain

INDAPAMIDE
Indications essential hypertension
Cautions see notes above; also acute porphyria (section 9.8.2)
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding present in milk—manufacturer advises avoid

Side-effects see notes above; also palpitation, diuresis with doses above 2.5 mg daily
Dose
• 2.5 mg daily in the morning

Indapamide (Non-proprietary) Tablets, s/c, indapamide 2.5 mg, net price 28-tab pack = £1.27, 56-tab pack = £2.01

Nafrilix® (Servier) Tablets, f/c, indapamide 2.5 mg. Net price 30-tab pack = £3.40, 60-tab pack = £6.80

XIPAMIDE
Indications oedema, hypertension (see also notes above)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding no information available
Side-effects see notes above
Dose
• Oedema, initially 40 mg daily in the morning, increased to 80 mg in resistant oedema, max. 20 mg daily in the morning
• Hypertension, 20 mg daily in the morning

Diurexan® (Meda) Tablets, scored, xipamide 20 mg, net price 140-tab pack = £19.46
2.2.2 Loop diuretics

Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and oedema due to peripheral venous stasis or calcium-channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide 5–10 mg daily or metolazone 5–20 mg daily).

If necessary, a loop diuretic can be added to anti-hypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henle in the renal tubule and are powerful diuretics. Furosemide and bumetanide are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration they have a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Torasemide has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

Cautions Hypovolaemia and hypotension should be corrected before initiation of treatment with loop diuretics; electrolytes should be monitored during treatment (see also Potassium Loss, section 2.2). Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and goit. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially; an adequate urinary output should be established before initiating treatment; interactions: Appendix 1 (diuretics).

Contra-indications Loop diuretics should be avoided in severe hypokalaemia, severe hyponatraemia, anuria, comatose and precomatose states associated with liver cirrhosis, and in renal failure due to nephrotic or hepatotoxic drugs.

Hepatic impairment Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this.

Renal impairment High doses of loop diuretics may occasionally be needed; high doses or rapid intravenous administration can cause tinnitus and deafness; high doses of bumetanide can also cause musculoskeletal pain.

Pregnancy Furosemide and bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.

Side-effects Side-effects of loop diuretics include mild gastrointestinal disturbances, pancreatitis, hepatic encephalopathy, postural hypotension, temporary increase in serum-cholesterol and triglyceride concentration, hyperglycaemia (less common than with thiazides), acute urinary retention, electrolyte disturbances (including hypokalaemia, hypokalaemia (see section 2.2), hypocalcaemia, hypochloraemia, and hypomagnesaemia), metabolic alkalosis, blood disorders (including bone-marrow depression, thrombocytopenia, and leucopenia), hyperuricaemia, visual disturbances, tinnitus and deafness (usually with high parenteral doses and rapid administration, and in renal impairment), and hypersensitivity reactions (including rash, photosensitivity, and pruritus).

Furosemide (frusemide)

Indications oedema (see notes above); resistant hypertension (see notes above)

Cautions see notes above; also hypoprotenaemia may reduce diuretic effect and increase risk of side-effects; hepatorenal syndrome; intravenous administration rate should not usually exceed 4 mg/minute, however single doses of up to 80 mg may be administered more rapidly

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above; also lower rate of infusion may be necessary

Pregnancy see notes above

Breast-feeding amount too small to be harmful; may inhibit lactation

Side-effects see notes above; also intrahepatic cholestasis and gout

Dose
- By mouth, oedema, initially 40 mg in the morning; maintenance 20–40 mg daily; Child under 18 years see BNF for Children
- Resistant oedema, 80–120 mg daily
- Resistant hypertension, 40–80 mg daily
- By intramuscular injection or slow intravenous injection (rate of administration, see Cautions above), initially 20–50 mg, increased if necessary in steps of 20 mg not less than every 2 hours; doses greater than 50 mg by intravenous infusion only; max. 1.5 g daily; Child under 18 years see BNF for Children

Furosemide (Non-proprietary)

Tablets, furosemide 20 mg, net price 28 = £1.85; 40 mg, 28 = £1.35; 80 mg, 28 = £2.60
Brands include Lyside®
Oral solution, sugar-free, furosemide, net price 20 mg/5 mL, 150 ml = £13.97; 40 mg/5 mL, 150 mL = £18.19; 50 mg/5 mL, 150 mL = £19.35
Brands include Prusol® (contains alcohol 10%)
Injection, furosemide 10 mg/mL, net price 2-mL amp = 30p, 5-mL amp = 38p, 25-mL amp = £2.50
Lasix® (Sanofi-Aventis)®
Injection, furosemide 10 mg/mL, net price 2-mL amp = 75p
Note Large-volume furosemide injections also available; brands include Minijet®

Bumetanide

Indications oedema (see notes above)

Cautions see notes above

Contra-indications see notes above
Potassium-sparing diuretics and aldosterone antagonists

2.2.3

Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding no information available; may inhibit lactation

Side-effects see notes above; also gynaecomastia, breast pain, musculoskeletal pain (associated with high doses in renal failure)

Dose
- By mouth, 1 mg in the morning, repeated after 6–8 hours if necessary; severe cases, 5 mg daily increased by 5 mg every 12–24 hours according to response; ELDERLY, 500 micrograms daily may be sufficient
- By intravenous injection, 1–2 mg, repeated after 20 minutes if necessary; ELDERLY, 500 micrograms daily may be sufficient
- By intravenous infusion, 2–5 mg over 30–60 minutes; ELDERLY, 500 micrograms daily may be sufficient
- By intramuscular injection, 1 mg initially then adjusted according to response; ELDERLY, 500 micrograms daily may be sufficient

Bumetanide (Non-proprietary)
Tablets, bumetanide 1 mg, net price 28-tab pack = £1.12; 5 mg, 28-tab pack = £4.33
Oral liquid, bumetanide 1 mg/5 mL, net price 150 mL = £128.00
Injection, bumetanide 500 micrograms/mL, net price 4-mL amp = £1.79

Burinex® (LEO)
Tablets, scored, bumetanide 1 mg, net price 28-tab pack = £1.52; 5 mg, 28 = £9.67

TORASEMIDE

Indications oedema (see notes above), hypertension
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy manufacturer advises avoid—no information available
Breast-feeding manufacturer advises avoid—no information available
Side-effects see notes above; also dry mouth; rarely limb paraesthesia

Dose
- Oedema, 5 mg once daily, preferably in the morning, increased if required to 20 mg once daily; usual max. 40 mg daily
- Hypertension, 2.5 mg daily, increased if necessary to 5 mg once daily

Torasemide (Non-proprietary)
Tablets, torasemide 2.5 mg, net price 28-tab pack = £3.78; 5 mg (scored), 28-tab pack = £5.53; 10 mg (scored), 28-tab pack = £8.14

AMILORITE HYDROCHLORIDE

Indications oedema; potassium conservation when used as an adjunct to thiazide or loop diuretics for hypertension, congestive heart failure, or hepatic cirrhosis with ascites
Cautions monitor electrolytes; diabetes mellitus; elderly; interactions: Appendix 1 (diuretics)
Contra-indications hyperkalaemia; anuria; Addison’s disease
Renal impairment monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment); manufacturers advise avoid in severe impairment
Pregnancy not used to treat gestational hypertension
Breast-feeding manufacturer advises avoid—no information available
Side-effects include gastro-intestinal disturbances, dry mouth, rashes, confusion, postural hypotension, hyperkalaemia, hyponatraemia

Dose
- Used alone, initially 10 mg daily or 5 mg twice daily, adjusted according to response; max. 20 mg daily
- With other diuretics, congestive heart failure and hypertension, initially 5–10 mg daily; cirrhosis with ascites, initially 5 mg daily

Amiloride (Non-proprietary)
Tablets, amiloride hydrochloride 5 mg, net price 28-tab pack = 96p
Oral solution, sugar-free, amiloride hydrochloride 5 mg/5 mL, net price 150 mL = £39.73
Brands include Amilamont® (Excipients include propylene glycol, see Excipients, p. 2)

Compound preparations with thiazide or loop diuretics
Section 2.2.4

TRIAMTERENE

Indications oedema, potassium conservation with thiazide and loop diuretics
Cautions see under Amilroide Hydrochloride; may cause blue fluorescence of urine
Contra-indications see under Amilroide Hydrochloride
Renal impairment monitor plasma-potassium concentration (high risk of hyperkalaemia in renal
Potassium-sparing diuretics and aldosterone antagonists

**Aldosterone antagonists**

Spironolactone potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide (section 2.2.2) can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure, see section 2.5.5.

Spironolactone is also used in primary hyperaldosteronism (Conn’s syndrome). It is given before surgery to enable a better perioperative course. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide (section 2.2.2) can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure, see section 2.5.5.

Potassium supplements must not be given with aldosterone antagonists.

**EPLERENONE**

**Indications**

adjunct in stable patients with left ventricular dysfunction with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event)

**Cautions**

measure plasma-potassium concentration before treatment, during initiation, and when dose changed; elderly; interactions: Appendix 1 (diuretics)

**Contra-indications**

hyperkalaemia; concomitant use of potassium-sparing diuretics or potassium supplements

**Hepatic impairment**

avoid in severe liver disease

**Renal impairment**

increased risk of hyperkalaemia—close monitoring required; avoid if eGFR less than 50 mL/minute/1.73 m²

**Pregnancy**

manufacturer advises caution—no information available

**Breast-feeding**

manufacturer advises use only if potential benefit outweighs risk

**Side-effects**

diarrhoea, nausea, hypotension; dizziness; hyperkalaemia; rash; less commonly: Fatigue, vomiting, atrial fibrillation, postural hypotension, arterial thrombosis, dyslipidaemia, pharyngitis, headache, insomnia, gynaecomastia, pyelonephritis, hyponatraemia, dehydration, eosinophilia, asthenia, malaise, back pain, leg cramps, impaired renal function, azotaemia, sweating and pruritus

**Dose**

● Initially 25 mg once daily, increased within 4 weeks to 50 mg once daily; CHILD not recommended

**Inspir®** (Pfizer) (BNM)

Tablets, yellow, f/c, eplerenone 25 mg, net price 28-tab pack = £42.72; 50 mg, 28-tab pack = £42.72

**SPIRONOLACTONE**

**Indications**

oedema and ascites in cirrhosis of the liver; malignant ascites, nephrotic syndrome, congestive heart failure (section 2.5.5); primary hyperaldosteronism

**Cautions**

potential metabolic products carcinogenic in rodents; elderly; monitor electrolytes (discontinue if hyperkalaemia); acute porphyria (section 9.8.2); interactions: Appendix 1 (diuretics)

**Contra-indications**

hyperkalaemia, hyponatraemia; anuria; Addison’s disease

**Renal impairment**

monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment); avoid if rapidly deteriorating or severe impairment

**Pregnancy**

feminisation of male fetus in animal studies

**Breast-feeding**

metabolites present in milk, but amount probably too small to be harmful

**Side-effects**

gastro-intestinal disturbances, hepatotoxicity; malaise, headache, confusion, drowsiness, dizziness; gynaecomastia, benign breast tumour, breast pain, menstrual disturbances, changes in libido, breast pain, menstrual disturbances, changes in libido; hypertrichosis, hyperkalaemia (discontinue), hyponatraemia, acute renal failure, hyperuricaemia, leucopenia, agranulocytosis, thrombocytopenia; leg cramps; alopecia, hirsutism, rash, and Stevens-Johnson syndrome

**Dose**

● 100–200 mg daily, increased to 400 mg if required; CHILD under 18 years, see BNF for Children

**Heart failure, see section 2.5.5**

**Spironolactone**

(Non-proprietary) (BNM)

**Tablets**, spironolactone 25 mg, net price 28 = £1.50; 50 mg, 28 = £2.11; 100 mg, 28 = £2.46. Label: 21

**Oral suspensions**, spironolactone 5 mg/5 mL, 10 mg/5 mL, 25 mg/5 mL, 50 mg/5 mL, and 100 mg/5 mL. Label: 21

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

**Aldactone®** (Pharmacia) (BNM)

**Tablets**, f/c, spironolactone 25 mg (buff), net price 100-tab pack = £8.89; 50 mg (white), 100-tab pack = £17.78; 100 mg (buff), 28-tab pack = £9.96. Label: 21

**With thiazides or loop diuretics**

Section 2.2.4
Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides (section 2.2.1) and potassium-sparing diuretics (section 2.2.3) separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops. For interactions, see Appendix 1 (diuretics).

Amiloride with thiazides

Co-amilozide (Non-proprietary)
Tablets, co-amilozide 2.5/25 (amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg), net price 28-tab pack = £3.73
Brands include Moduret 25®
Dose hypertension, initially 1 tablet daily, increased if necessary to max. 2 tablets daily
Congestive heart failure, initially 1 tablet daily, increased if necessary to max. 4 tablets daily
Oedema and ascites in cirrhosis of the liver, initially 2 tablets daily, increased if necessary to max. 4 tablets daily
Oedema and ascites in cirrhosis of the liver, initially ½ tablet daily, increased if necessary to max. 2 tablets daily

Amiloride with loop diuretics

Co-amilofruse (Non-proprietary)
Tablets, co-amilofruse 2.5/25 (amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg), net price 28-tab pack = £3.73
Brands include Moduret 25®
Dose hypertension, initially 1 tablet daily, increased if necessary to max. 2 tablets daily
Congestive heart failure, initially 1 tablet daily, increased if necessary to max. 4 tablets daily
Oedema and ascites in cirrhosis of the liver, initially 2 tablets daily, increased if necessary to max. 4 tablets daily
Oedema and ascites in cirrhosis of the liver, initially ½ tablet daily, increased if necessary to max. 2 tablets daily

Amiloride with bumetanide

Co-amilofruse (Non-proprietary)
Tablets, co-amilofruse 10/20 (amiloride hydrochloride 10 mg, furosemide 20 mg), net price 28-tab pack = £1.18, 56-tab pack = £1.83
Brands include Frumil LS®
Dose oedema, 1 tablet in the morning
Tablets, co-amilofruse 5/40 (amiloride hydrochloride 5 mg, furosemide 40 mg), net price 28-tab pack = £1.17, 56-tab pack = £1.42
Brands include Frumil®
Dose oedema, 1–2 tablets in the morning
Tablets, co-amilofruse 10/80 (amiloride hydrochloride 10 mg, furosemide 80 mg), net price 28-tab pack = £11.51
Dose oedema, 1 tablet in the morning

Spironolactone with thiazides

Triamterene with thiazides
Counselling Urine may look slightly blue in some lights

Spironolactone with loop diuretics

Triamterene with loop diuretics
Counselling Urine may look slightly blue in some lights

Osmotic diuretics

Mannitol is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.
2.2.6 Mercurial diuretics

MANNITOL

Indications  see notes above; glaucoma (section 11.6)
Cautions  extravasation causes inflammation and thrombophlebitis; monitor fluid and electrolyte balance, serum osmolality, and pulmonary and renal function; assess cardiac function before and during treatment; interactions: Appendix 1 (mannitol)
Contra-indications  severe cardiac failure; severe pulmonary oedema; intracranial bleeding (except during craniotomy); anuria; severe dehydration
Renal impairment  use with caution in severe impairment
Pregnancy  manufacturer advises avoid unless essential—no information available
Breast-feeding  manufacturer advises avoid unless essential—no information available
Side-effects  less commonly hypotension, thrombophlebitis, fluid and electrolyte imbalance; rarely dry mouth, thirst, nausea, vomiting, oedema, raised intracranial pressure, arrhythmia, hypertension, pulmonary oedema, chest pain, headache, convulsions, dizziness, chills, fever, urinary retention, focal osmotic nephrosis, dehydration, cramp, blurred vision, rhinitis, skin necrosis, and hypersensitivity reactions (including urticaria and anaphylaxis); very rarely congestive heart failure and acute renal failure

Dose  • Cerebral oedema and raised intraocular pressure, by intravenous infusion over 30–60 minutes, 0.25–2 g/kg repeated if necessary 1–2 times after 4–8 hours
Note  For mannitol 20%, an in-line filter is recommended (15-micron filters have been used)

Mannitol (Baxter)  
Intravenous infusion, mannitol 10%, net price 500-mL Viaflex® bag = £2.26, 500-mL Viaflora® bag = £2.15; 20%, net price 250-mL Viaflex® bag = £3.27, 250-mL Viaflora® bag = £3.27, 500-mL Viaflex® bag = £3.29, 500-mL Viaflora® bag = £3.12

2.2.6 Mercurial diuretics

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

2.2.7 Carbonic anhydrase inhibitors

The carbonic anhydrase inhibitor acetazolamide is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Acetazolamide and eye drops of dorzolamide and brinzolamide inhibit the formation of aqueous humour and are used in glaucoma (section 11.6).

2.2.8 Diuretics with potassium

Many patients on diuretics do not need potassium supplements (section 9.2.1.1). For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should not usually be given together.

Counselling  Modified-release potassium tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

Diurete K Continus® (Teofarma)  Tablets, white/orange, f/c, furosemide 40 mg, potassium 8 mmol for modified release, net price 30-tab pack = £3.00. Label: 25, 27, counselling, see above

Neo-NeClex-K® (Goldshield)  Tablets, pink/white, f/c, bendrofluamide 2.5 mg, potassium 8.4 mmol for modified release, net price 100 tab-pack = £8.99. Label: 25, 27, counselling, see above

2.3 Anti-arrhythmic drugs

2.3.1 Management of arrhythmias

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

Ectopic beats  If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

Atrial fibrillation  All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism, and thromboprophylaxis given if necessary (see below). Atrial fibrillation can be managed by either controlling the ventricular rate or by attempting to restore and maintain sinus rhythm.

All haemodynamically unstable patients with acute-onset atrial fibrillation should undergo electrical cardioversion. Intravenous amiodarone, or alternatively flecainide, can be used in non-life-threatening cases when electrical cardioversion is delayed. If urgent ventricular rate control is required, a beta-blocker, verapamil, or amiodarone can be given intravenously.

In haemodynamically stable patients, a rhythm-control treatment strategy is preferred for patients with paroxysmal atrial fibrillation; rate-control is preferred for those with permanent atrial fibrillation. For patients with persistent atrial fibrillation, the treatment strategy should be based on criteria such as age, co-morbidities, presence of symptoms, and the relative advantages and disadvantages of each treatment.

Ventricular rate can be controlled with a beta-blocker (section 2.4), or diltiazem [unlicensed indication], or verapamil. Digoxin is usually only effective for controlling the ventricular rate at rest, and should therefore
Like atrial fibrillation, treatment options depend on whether there are risk factors for stroke, or if warfarin is contraindicated at preventing emboli, but may be appropriate if the patient with atrial fibrillation is a candidate for cardioversion procedures (see section 2.8.1). Aspirin (section 2.9) is less effective than warfarin for stroke prevention in patients with atrial fibrillation. Anticoagulants are indicated during cardioversion procedures (see section 2.8.1). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored by electrical cardioversion (see section 2.8.2) for at least 3 weeks; if this is not possible, parenteral anticoagulation (section 2.8.1) should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks. For atrial fibrillation of over 48 hours duration, electrical cardioversion is preferred to pharmacological cardioversion. If treatment is required to maintain sinus rhythm, a beta-blocker is used. If a standard beta-blocker is not appropriate or is ineffective, an oral anti-arrhythmic drug such as sotalol (section 2.4), flecainide, propafenone, or amiodarone, is required.

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a beta-blocker. Alternatively, if symptoms persist or a beta-blocker is not appropriate, an oral anti-arrhythmic drug such as sotalol, flecainide, propafenone, or amiodarone can be given (see also Paroxysmal Supraventricular Tachycardia below, and Supraventricular Arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the 'pill-in-the-pocket' approach; this involves the patient taking oral flecainide or propafenone to self-treat an episode of atrial fibrillation when it occurs. All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis. Anticoagulants (section 2.8) are indicated for those with cardiovascular disease, diabetes, hypertension, or impaired left ventricular function; anticoagulants should be considered for those with atrial fibrillation and who are at high risk of stroke. Warfarin (section 2.6.2) or intravenous anti-arrhythmic drug such as sotalol, flecainide, propafenone, or amiodarone, is preferred if symptoms persist or a beta-blocker is not effective, and may be particularly useful in those with heart failure. Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated (see section 2.8.2) for at least 3 weeks; if this is not possible, parenteral anticoagulation (section 2.8.1) should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks. Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide or propafenone can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem [unlicensed indication], or verapamil. Amiodarone can be used when other drug treatments are contra-indicated or ineffective. All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation (see notes above).

**Paroxysmal supraventricular tachycardia** This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring. If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine (section 2.3.2) should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil (section 2.6.2) is an alternative, but it should be avoided in patients recently treated with beta-blockers (see p. 133).

Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found). Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem, verapamil, beta-blockers including sotalol (section 2.4), flecainide, or propafenone (section 2.3.2).

**Arrhythmias after myocardial infarction** In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an anti-arrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension,
2.3.2 Drugs for arrhythmias

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

- **Class I**: membrane stabilising drugs (e.g. lidocaine, flecaïnine)
- **Class II**: beta-blockers
- **Class III**: amiodarone; sotalol (also Class II)
- **Class IV**: calcium-channel blockers (includes verapamil but not dihydropyridines)

**Cautions** The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

---

**Supraventricular arrhythmias**

**Adenosine** is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole), most side-effects are short lived. Unlike verapamil, adenosine can be used after a beta-blocker. Verapamil may be preferable to adenosine in asthma.

**Dronedarone** is a multi-channel blocking anti-arrhythmic drug; it is licensed for use in clinically stable patients with previous or current non-permanent atrial fibrillation, to prevent recurrence or to lower the ventricular rate.

The **Scottish Medicines Consortium (p. 4)** has advised (August 2010) that dronedarone (Multaq<sup>®</sup>) is accepted for restricted use within NHS Scotland for the prevention of recurrence of atrial fibrillation in patients in whom conventional first-line anti-arrhythmic drugs are ineffective, contra-indicated, or not tolerated; treatment should be initiated on specialist advice only.

---

**Dronedarone for the treatment of non-permanent atrial fibrillation (August 2010)**

Dronedarone is an option for the treatment of non-permanent atrial fibrillation only in patients who:

- are not controlled on first-line therapy (usually including beta-blockers), and
- do not have unstable New York Heart Association class III or IV heart failure, and
- have at least one cardiovascular risk factor from the following:
  - hypertension managed by at least two different drug classes
  - diabetes mellitus
  - previous transient ischaemic attack, stroke, or systemic embolism
  - left atrial diameter ≥50 mm
  - left ventricular ejection fraction <40%
  - age ≥70 years

---

**NICE guidance**

**Dronedarone for the treatment of non-permanent atrial fibrillation (August 2010)**

Dronedarone is an option for the treatment of non-permanent atrial fibrillation only in patients who:

- are not controlled on first-line therapy (usually including beta-blockers), and
- do not have unstable New York Heart Association class III or IV heart failure, and
- have at least one cardiovascular risk factor from the following:
  - hypertension managed by at least two different drug classes
  - diabetes mellitus
  - previous transient ischaemic attack, stroke, or systemic embolism
  - left atrial diameter ≥50 mm
  - left ventricular ejection fraction <40%
  - age ≥70 years

---

2.3.2 Drugs for arrhythmias

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone), and those that act on ventricular arrhythmias (e.g. lidocaine).

---

2 Cardiovascular system

Ventricular tachycardia

Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary Resuscitation, section 2.7.3).

Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone (section 2.3.2) should be administered and direct current cardioversion repeated.

Patients with sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone is the preferred drug. Flecaïnine, propafenone (section 2.3.2), and, although less effective, lidocaine (section 2.3.2) have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered.

Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker (section 2.4).

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol (in place of a standard beta-blocker), or amiodarone (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

**Torsade de pointes** is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulphate (section 9.5.1.3) is usually effective. A beta-blocker (but not sotalol) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.
Oral administration of a cardiac glycoside (such as digoxin, section 2.1.1) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome).

Verapamil (section 2.6.2) is usually effective for supraventricular tachycardias. An initial intravenous dose (important: serious beta-blocker interaction hazard, see p. 133) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil with dangerous consequences.

Intravenous administration of a beta-blocker (section 2.4) such as esmolol or propranolol, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone, beta-blockers (see p. 98), disopyramide, flecainide, procainamide (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988), and propafenone, see below under Supraventricular and Ventricular Arrhythmias.

### ADENOSINE

**Indications** rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome); aid to diagnosis of broad or narrow complex supraventricular tachycardias

**Cautions** monitor ECG and have resuscitation facilities available; atrial fibrillation or flutter with accessory pathway (conduction down anomalous pathway may increase); first-degree AV block; bundle branch block; left main coronary artery stenosis; uncorrected hypovolaemia; stenotic valvular heart disease; left to right shunt; pericarditis; pericardial effusion; autonomic dysfunction; stenotic carotid artery disease with cerebrovascular insufficiency; recent myocardial infarction; heart failure; heart transplant (see below);

**Contra-indications** second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted); bradycardia; prolonged QT interval; haemodynamically unstable patients (including those with moderate or severe heart failure).

**Hepatic impairment** avoid in severe impairment

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid—毒性 in animal studies

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** gastro-intestinal disturbances; QT-interval prolongation, bradycardia; fatigue, asthenia; rash, pruritus; raised serum creatinine; less commonly taste disturbance; erythema, eczema, dermatitis, photosensitivity

**Dose**

- **By mouth**, 400 mg twice daily

**Multaq** (Sanofi-Aventis) ▼

| Tablets, f/c, dronedarone (as hydrochloride) 400 mg, net price 20-tab pack = £22.50, 60-tab pack = £87.50. | Label: 21 |

### DRONEDARONE

**Indications** see notes above

**Cautions** heart failure (avoid in patients with a recent history of moderate heart failure, or with a significantly reduced left ventricular function); correct hypokalaemia and hypomagnesaemia before starting and during treatment; measure serum creatinine 7 days after initiation; **interactions:** Appendix 1 (dronedarone)

**Contra-indications** second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted); bradycardia; prolonged QT interval; haemodynamically unstable patients (including those with moderate or severe heart failure).

**Hepatic impairment** avoid in severe impairment

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid—毒性 in animal studies

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** gastro-intestinal disturbances; QT-interval prolongation, bradycardia; fatigue, asthenia; rash, pruritus; raised serum creatinine; less commonly taste disturbance; erythema, eczema, dermatitis, photosensitivity

**Dose**

- **By mouth**, 400 mg twice daily

**Multaq** (Sanofi-Aventis) ▼

| Tablets, f/c, dronedarone (as hydrochloride) 400 mg, net price 20-tab pack = £22.50, 60-tab pack = £87.50. | Label: 21 |

### Supraventricular and ventricular arrhythmias

Amiodarone is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated. It can be used for paroxysmal supraventricu-
larr, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolf-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone, intravenous amiodarone acts relatively rapidly.

Intravenous injection of amiodarone can be used in cardiopulmonary resuscitation for ventricular fibrillation or pulseless tachycardia unresponsive to other interventions (section 2.7.3).

Amiodarone has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses can cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely (see also Appendix 1).

Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought. Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen (section 13.8.1) to protect against both long-wave ultraviolet and visible light should be used.

Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism may occur. Clinical assessment alone is unreliable, and laboratory tests should be performed before treatment and every 6 months. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis. The thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hyperthyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone. Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on cardiac contractility. Oral administration of disopyramide is useful, but it has an antimuscarnic effect which limits its use in patients susceptible to angle-closure glaucoma or with prostatic hyperplasia.

Flecainide belongs to the same general class as lidocaine and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for functional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

Propafenone is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contra-indicated if severe).

Drugs for supraventricular arrhythmias include adenosine, cardiac glycosides, and verapamil; see above under Supraventricular Arrhythmias. Drugs for ventricular arrhythmias include lidocaine; see under Ventricular Arrhythmias, p. 96.

Mexiletine and procainamide are both available from ‘special-order’ manufacturers or specialist importing companies, see p. 98. Mexiletine can be used for life-threatening ventricular arrhythmias; procainamide is given by intravenous injection to control ventricular arrhythmias.

### AMIODARONE HYDROCHLORIDE

**Indications** see notes above (should be initiated in hospital or under specialist supervision)

**Cautions** liver-function and thyroid-function tests required before treatment and then every 6 months (see notes above for tests of thyroid function); hypokalaemia (measure serum-potassium concentration before treatment); chest x-ray required before treatment; heart failure; elderly; severe bradycardia and conduction disturbances in excessive dosage; intravenous use may cause moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) or severe hepatocellular toxicity (monitor transaminases closely); administration by central venous catheter recommended if repeated or continuous infusion required—infusion via peripheral veins may cause pain and inflammation; ECG monitoring and resuscitation facilities must be available during intravenous use; acute porphyria (section 9.8.2), interactions: Appendix 1 (amiodarone)

**Contra-indications** (except in cardiac arrest) sinus bradycardia, sino-atrial heart block; unless pacemaker fitted avoid in severe conduction disturbances or sinus node disease; thyroid dysfunction; iodine sensitivity; avoid intravenous use in severe respiratory failure, circulatory collapse, or severe arterial hypertension; avoid bolus injection in congestive heart failure or cardiomyopathy

**Pregnancy** possible risk of neonatal goitre; use only if no alternative

**Breast-feeding** avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine

**Side-effects** nausea, vomiting, taste disturbances, raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders), jaundice; bradycardia (see Cautions):
2.3.2 Drugs for arrhythmias

BNF 61

Flecainide Acetate

Indications
- Ventricular arrhythmias, especially after myocardial infarction, supraventricular arrhythmias

Cautions
- Monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de pointes (discontinue if occur); atrial flutter or atrial tachycardia with partial block, bundle branch block, heart failure (avoid if severe); prostatic enlargement; susceptibility to angle-closure glaucoma; avoid in acute porphyria (section 9.8.2);

Contra-indications
- Second- and third-degree heart block and sinus node dysfunction (unless pacemaker fitted); cardiogenic shock; severe uncompensated heart failure

Hepatic impairment
- Half-life prolonged—may need dose reduction

Renal impairment
- Reduce dose by increasing dose interval; adjust according to response; avoid sustained-release preparation

Pregnancy
- May induce labour if used in third trimester

Breast-feeding
- Present in milk—use only if essential and monitor infant for antimuscarinic effects

Side-effects
- Ventricular tachycardia, ventricular fibrillation or torsade de pointes (usually associated with prolongation of QRS complex or QT interval—see Cautions above), myoccardial depression, hypotension, AV block; antimuscarinic effects include dry mouth, blurred vision, urinary retention, and very rarely angle-closure glaucoma; gastro-intestinal irritation; psychosis, cholestatic jaundice, hypoglycaemia also reported (see Cautions above)

Dose
- By mouth, 300–800 mg daily in divided doses
- By slow intravenous injection, 2 mg/kg over at least 5 minutes to a max. of 150 mg, with ECG monitoring, followed immediately either by 200 mg by mouth, then 200 mg every 8 hours for 24 hours or 400 micrograms/kg/hour by intravenous infusion; max. 300 mg in first hour and 800 mg daily

Disopyramide (Non-proprietary)
- Capsules, disopyramide (as phosphate) 100 mg, net price 84 = £24.38; 150 mg, 84 = £32.57

Rythmodan® (Sanofi-Aventis)
- Capsules, disopyramide 100 mg (green/beige), net price 84-cap pack = £14.14; 150 mg, 84-cap pack = £18.76

Injection, disopyramide (as phosphate) 10 mg/mL, net price 5-ml amp = £2.61

Modified release
- Rythmodan Retard® (Sanofi-Aventis)
- Tablets, m/r, scored, f/c, disopyramide (as phosphate) 250 mg, net price 60-cap pack = £27.72.

Label: 25
Dose
- 250-375 mg every 12 hours

Flecainide Acetate

Indications
- Capsules, tablets, and injection: AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g., Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily)

Immediate-release tablets only: symptomatic sustained ventricular tachycardia, disabling symptoms of premature ventricular contractions or non-sustained ventricular tachycardia in patients resistant to or intolerant of other therapy

Injection only: ventricular tachycarryrhythmias resistant to other treatment

Cautions
- Patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably); atrial fibrillation following heart surgery; elderly (accumulation may occur); ECG monitoring and resuscitation facilities

Disopyramide

Indications
- Ventricular arrhythmias, especially after myocardial infarction, supraventricular arrhythmias

Cautions
- Monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de pointes (discontinue if occur); atrial flutter or atrial tachycardia with partial block, bundle branch block, heart failure (avoid if severe); prostatic enlargement; susceptibility to angle-closure glaucoma; avoid in acute porphyria (section 9.8.2); Interactions: Appendix 1 (disopyramide)

Contra-indications
- Second- and third-degree heart block and sinus node dysfunction (unless pacemaker fitted); cardiogenic shock; severe uncompensated heart failure

Hepatic impairment
- Half-life prolonged—may need dose reduction

Renal impairment
- Reduce dose by increasing dose interval; adjust according to response; avoid sustained-release preparation

Pregnancy
- May induce labour if used in third trimester

Breast-feeding
- Present in milk—use only if essential and monitor infant for antimuscarinic effects

Side-effects
- Ventricular tachycardia, ventricular fibrillation or torsade de pointes (usually associated with prolongation of QRS complex or QT interval—see Cautions above), myoccardial depression, hypotension, AV block; antimuscarinic effects include dry mouth, blurred vision, urinary retention, and very rarely angle-closure glaucoma; gastro-intestinal irritation; psychosis, cholestatic jaundice, hypoglycaemia also reported (see Cautions above)

Dose
- By mouth, 200 mg 3 times daily for 1 week reduced to 200 mg twice daily for a further week; maintenance, usually 200 mg daily or the minimum required to control the arrhythmia
- By intravenous infusion (see Cautions above), initially 5 mg/kg over 20–120 minutes with ECG monitoring; subsequent infusion given if necessary according to response up to max. 1.2 g in 24 hours
- Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation, section 2.7.3

Amiodarone (Non-proprietary)
- Tablets, amiodarone hydrochloride 100 mg, net price 28-tab pack = £1.75; 200 mg, 28-tab pack = £2.22. Label: 11
- Injection, amiodarone hydrochloride 30 mg/mL, net price 10-mL prefilled syringe = £19.60

Sterile concentrate, amiodarone hydrochloride 50 mg/mL, net price 3-ml amp = £1.33, 6-ml amp = £2.86. For dilution and use as an infusion
- Excipients may include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 2)

Cordarone X® (Sanofi-Aventis)
- Tablets, scored, amiodarone hydrochloride 100 mg, net price 28-tab pack = £4.28; 200 mg, 28-tab pack = £6.99. Label: 11
- Sterile concentrate, amiodarone hydrochloride 50 mg/mL, net price 3-ml amp = £1.33. For dilution and use as an infusion
- Excipients may include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 2)

pulmonary toxicity (including pneumonitis and fibrosis); tremor, sleep disorders; hypothyroidism, hyperthyroidism; reversible corneal microdeposits (sometimes with night glare); phototoxicity, persistent slate-grey skin discoloration (see also notes above), injection-site reactions, less commonly onset or worsening of arrhythmia, conduction disturbances (see Cautions), peripheral neuropathy and myopathy (usually reversible on withdrawal); very rarely chronic liver disease including cirrhosis, sinus arrest, bronchospasm (in patients with severe respiratory failure), ataxia, benign intracranial hypertension, headache, vertigo, epididymo-orchitis, impotence, haemolytic or aplastic anaemia, thrombocytopenia, rash (including exfoliative dermatitis), hypersensitivity including vasculitis, alopecia, impaired vision due to optic neuritis or optic neuropathy (including blindness), anaphylaxis on rapid injection, also hypotension, respiratory distress syndrome, sweating, and hot flushes
must be available during intravenous use; interactions: Appendix 1 (flecainide)

**Contra-indications** heart failure; abnormal left ventricular function; history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia; long-standing atrial fibrillation where conversion to sinus rhythm not attempted; haemodynamically significant valvular heart disease; avoid in sinus node dysfunction, atrial conduction defects, second-degree or greater AV block, bundle branch block or distal block unless pacing rescue available

**Hepatic impairment** avoid (or reduce dose) in severe liver disease

**Renal impairment** reduce initial oral dose to max. 100 mg daily or reduce intravenous dose by 50%, if eGFR less than 35 mL/minute/1.73 m$^2$

**Pregnancy** used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hyperbilirubinemia also reported

**Breast-feeding** significant amount present in milk but not known to be harmful

**Side-effects** oedema, pro-arrhythmic effects; dizziness, asthenia, fatigue, fever; visual disturbances; rarely pneumonitis, hallucinations, depression, confusion, amnesia, dyskinesia, convulsions, peripheral neuropathy; also reported gastrointestinal disturbances, anorexia, hepatic dysfunction, flushing, syncope, drowsiness, tremor, vertigo, headache, anxiety, insomnia, ataxia, paraesthesia, anaesthesia, leucopenia, thrombocytopenia, corneal deposits, flushing, syncope, dizziness, hypotension, tinnitus, increased antinuclear antibodies, hypersensitivity reactions (including rash, urticaria, and photosensitivity), increased sweating

**Dose**

- **By mouth** (initiated under direction of hospital consultant), ventricular arrhythmias, initially 100 mg twice daily (max. 400 mg daily usually reserved for rapid control or in heavily built patients); reduced after 3–5 days to the lowest dose that controls arrhythmia

Supraventricular arrhythmias, 50 mg twice daily, increased if required to max. 300 mg daily

- **By slow intravenous injection** (in hospital), 2 mg/kg over 10–30 minutes, max. 150 mg, with ECG monitoring; followed if required by infusion at a rate of 1.5 mg/kg/hour for 1 hour, subsequently reduced to 100–250 micrograms/kg/hour for up to 24 hours; max. cumulative dose in first 24 hours, 600 mg; transfer to **oral** treatment, as above

**Flecainide** (Non-proproprietary) [A]

- **Tablets**, flecainide acetate 50 mg, net price 60-tab pack = £6.04; 100 mg, 60-tab pack = £8.95

- **Tambocor** [A] [C]
  - **Tablets**, flecainide acetate 50 mg, net price 60-tab pack = £11.57; 100 mg (scored), 60-tab pack = £16.53
  - **Injection**, flecainide acetate 10 mg/mL, net price 15-mL amp = £4.40

**Modified release**

**Tambocor** [A] [C]

- **Capsules**, m/c, grey/pink, flecainide acetate 200 mg, net price 30-cap pack = £14.77. Label: 25

**Ventricular arrhythmias** Intravenous lidocaine can be used for the treatment of ventricular tachycardia in haemodynamically stable patients (section 2.3.1), and ventricular fibrillation and pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation (section 2.7.3), however it is no longer the anti-arrhythmic drug of first choice.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone, beta-blockers, disopyramide, flecainide, procainamide (available from ‘special-order’ manufacturers or specialist importing
companies, see p. 988), and propafenone, see above under Supraventricular and Ventricular Arrhythmias.

Mexiletine is available from ‘special-order’ manufacturers or specialist importing companies (see p. 988) for treatment of life-threatening ventricular arrhythmias.

**LIDOCAINE HYDROCHLORIDE** (Lignocaine hydrochloride)

**Indications** ventricular arrhythmias, especially after myocardial infarction; eye (section 11.7); local anaesthesia (section 15.2)

**Cautions** lower doses in congestive cardiac failure and following cardiac surgery; monitor ECG and have resuscitation facilities available; elderly; **interactions:** Appendix 1 (lidocaine)

**Contra-indications** sino-atrial disorders, all grades of atrioventricular block, severe myocardial depression; acute porphyria (section 9.8.2)

**Hepatic impairment** caution—increased risk of side-effects

**Renal impairment** possible accumulation of lidocaine and active metabolite; caution in severe impairment

**Pregnancy** crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk

**Breast-feeding** present in milk but amount too small to be harmful

**Side-effects** dizziness, paraesthesia, or drowsiness (particularly if injection too rapid); other CNS effects include confusion, respiratory depression and convulsions; hypotension and bradycardia (may lead to cardiac arrest); rarely hypersensitivity reactions including anaphylaxis

**Dose**

- By intravenous injection, in patients without gross circulatory impairment, 100 mg as a bolus over a few minutes (50 mg in lighter patients or those whose circulation is severely impaired), followed immediately by infusion of 4 mg/minute for 30 minutes, 2 mg/minute for 2 hours, then 1 mg/minute; reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion)

**Note** Following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 50–100 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

**Lidocaine (Non-proprietary)**

- **Injection 1%**, lidocaine hydrochloride 10 mg/mL, net price 2-mL amp = 21p; 5-mL amp = 26p; 10-mL amp = 39p; 20-mL amp = 78p
- **Injection 2%**, lidocaine hydrochloride 20 mg/mL, net price 2-mL amp = 32p; 5-mL amp = 31p; 10-mL amp = 60p; 20-mL amp = 80p
- **Infusion**, lidocaine hydrochloride 0.1% (1 mg/mL) and 0.2% (2 mg/mL) in glucose intravenous infusion 5%, 500-ml containers

**Minijet® Lignocaine** (UCB Pharma)

- **Injection**, lidocaine hydrochloride 1% (10 mg/mL), net price 10-mL disposable syringe = £8.48; 2% (20 mg/mL), 5-mL disposable syringe = £8.18

**2.4 Beta-adrenoceptor blocking drugs**

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors. Oxrenolol, pindolol, acebutolol, and celiprolol have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. Atenolol, celiprolol, nadolol, and sotalol are the most water-soluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers, such as atenolol, bisoprolol, carvedilol, celiprolol, and nadolol, have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure (see also section 2.5.5). Sotalol may prolong the QT interval, and it occasionally causes life-threatening ventricular arrhythmias (important: particular care is required to avoid hypokalaemia in patients taking sotalol).

Labetalol, celiprolol, carvedilol, and nebivolol are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance. There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate bronchospasm and should therefore usually be avoided in patients with a history of asthma. When there is no suitable alternative, it may be necessary for a patient with well-controlled asthma, or chronic obstructive pulmonary disease (without significant reversible airways obstruction), to receive treatment with a beta-blocker for a co-existing condition (e.g. heart failure or following myocardial infarction). In this situation, a cardioselective beta-blocker should be selected and initiated at a low dose by a specialist; the patient should be closely monitored for adverse effects. Atenolol, bisoprolol, metoprolol, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta, (bronchial) receptors and are, therefore, relatively car-
dioselective, but they are not cardioselective. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA, see above), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers, see above).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers (see above) may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Pregnancy Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension. The use of labetalol in maternal hypertension is not understood, but they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect is also partly explained by their mode of action.

Pregnancy should be monitored as there is a risk of possible toxicity due to beta-blockade (and alpha-blockade with labetalol or carve-dilol), but the amount of most beta-blockers present in milk is too small to affect infants. Acebutolol, atenolol, nadolol, and sotalol are present in milk in greater amounts than other beta-blockers. The manufacturers of celiprolol, esmolol, and nebivolol advise avoidance if breast-feeding.

Hypertension The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high; for example, atenolol is given in a dose of 25–50 mg daily and it is rarely necessary to increase the dose to 100 mg.

Beta-blockers can be used to control the pulse rate in patients with *pseudochromocytoma* (section 2.5.4). However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamidine should always be used together with the beta-blocker.

Angina By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with *angina* (for further details on the management of stable angina and acute coronary syndromes, see section 2.10.1). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease (important: see p. 133).

Myocardial infarction For advice on the management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction, see section 2.10.1. Several studies have shown that some beta-blockers can reduce the recurrence rate of myocardial infarction. However, among patients with previous failure, hypotension, bradycardia, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol and metoprolol may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol, metoprolol, propranolol, and timolol have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less convincing; some have not been tested in trials of secondary prevention. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia.

Arrhythmias Beta-blockers act as *anti-arrhythmic drugs* principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response to atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachyarrhythmias, and are used to control those following myocardial infarction (see above).

Esmolol is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

Sotalol, a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

Heart failure Beta-blockers may produce benefit in heart failure by blocking sympathtic activity. Bisoprolol and carvedilol reduce mortality in any grade of stable heart failure, while nebivolol is licensed for stable mild to moderate heart failure in patients over 70
years. Treatment should be initiated by those experienced in the management of heart failure (section 2.5.5).

Thyrotoxicosis Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol can reverse clinical symptoms of thyrotoxicosis within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier (section 6.2.2).

Other uses Beta-blockers have been used to alleviate some symptoms of anxiety, probably patients with palpitation, tremor, and tachycardia respond best (see also section 4.1.2 and section 4.9.3). Beta-blockers are also used in the prophylaxis of migraine (section 4.7.4.2). Betaxolol, carteolol, levobunolol, metipranolol, and timolol are used topically in glaucoma (section 11.6).

**PROPRANOLOL HYDROCHLORIDE**

**Indications** see under Dose

**Cautions** see notes above; also avoid abrupt withdrawal especially in ischaemic heart disease; first-degree AV block; portal hypertension (risk of deterioration in liver function); diabetes; history of obstructive airways disease (introduce cautiously and monitor lung function—see notes above); myasthenia gravis; symptoms of hypeoglycaemia and thyrotoxicosis may be masked (also see notes above); pororrhea; history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity reaction, also may reduce response to adrenergic (epinephrine) (see also section 3.4.3); interactions: Appendix 1 (beta-blockers), important: verapamil interaction, see also p. 133

**Contra-indications** asthma (but see notes above), uncontrolled heart failure, Prinzmetal's angina, marked bradycardia, hypotension, sick sinus syndrome, second- or third-degree AV block, cardiogenic shock, metabolic acidosis, severe peripheral arterial disease; phaeochromocytoma (apart from specific use with alpha-blockers, see also notes above)

**Bronchospasm** Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma or bronchospasm. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision.

**Hepatic impairment** reduce oral dose

**Renal impairment** manufacturer advises caution—dose reduction may be required

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also gastro-intestinal disturbances; bradycardia, heart failure, hypotension, conduction disorders, peripheral vasaconstriction (including exacerbation of intermittent claudication and Raynaud’s phenomenon); bronchospasm (see above), dyspnoea; headache, fatigue, sleep disturbances, paraesthesia, dizziness, vertigo, psychoses; sexual dysfunction; purpura, thrombocytopenia; visual disturbances; exacerbation of psoriasis, alopecia; rarely rash and dry eyes (reversible on withdrawal); over dosage: see Emergency Treatment of Poisoning, p. 37

**Dose**

- **By mouth,** hypertension, initially 80 mg twice daily, increased at weekly intervals as required; maintenance 160–320 mg daily
- Prophylaxis of variceal bleeding in portal hypertension, initially 40 mg twice daily, increased to 80 mg twice daily according to heart rate; max. 160 mg twice daily
- Phaeochromocytoma (only with an alpha-blocker), 60 mg daily for 3 days before surgery or 30 mg daily in patients unsuitable for surgery
- Angina, initially 40 mg 2–3 times daily; maintenance 120–240 mg daily
- Arrhythmias, hypertrophic cardiomyopathy, anxiety tachycardia, and thyrotoxicosis (adjunct), 10–40 mg 3–4 times daily
- Anxiety with symptoms such as palpitation, sweating, tremor, 40 mg once daily, increased to 40 mg 3 times daily if necessary
- Prophylaxis after myocardial infarction, 40 mg 4 times daily for 2–3 days, then 80 mg twice daily, beginning 5 to 21 days after infarction
- Essential tremor, initially 40 mg 2–3 times daily; maintenance 80–160 mg daily
- Migraine prophylaxis, 80–240 mg daily in divided doses

- **By intravenous injection,** arrhythmias and thyrotoxic crisis, 1 mg over 1 minute; if necessary repeat at 2-minute intervals; max. total dose 10 mg (5 mg in anaesthesia)

**Note** Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms, for over dosage see Emergency Treatment of Poisoning, p. 37

**Propranolol** (Non-proprietary)

- **Tablets,** propranolol hydrochloride 10 mg, net price 28 = 92p; 40 mg, 28 = 93p; 80 mg, 56 = £1.54; 160 mg, 56 = £4.02. Label: 8

**Brands include**

- **Angles**

- **Injection,** propranolol hydrochloride 1 mg/mL, net price 1-mL amp = 21p

**Modified release**

**Note** Modified-release preparations can be used for once daily administration

**Half-**<BR>**Inderal LA<sup>®</sup> (AstraZeneca)**

- **Tablets,** m/r, lavender/pink, propranolol hydrochloride 80 mg, net price 28-cap pack = £5.40. Label: 8, 25

**Note** Modified-release capsules containing propranolol hydrochloride 80 mg also available; brands include Bedrolol SR<sup>®</sup>, Half Beta Prograne<sup>®</sup>

**Inderal LA<sup>®</sup> (AstraZeneca)**

- **Tablets,** m/r, lavender/pink, propranolol hydrochloride 160 mg, net price 28-cap pack = £1.91. Label: 8, 25

**Note** Modified-release capsules containing propranolol hydrochloride 160 mg also available; brands include Bedrolon SR<sup>®</sup>, Beta Prograne<sup>®</sup>, Slo-Pro<sup>®</sup>
100 2.4 Beta-adrenoceptor blocking drugs

**ACEBUTOLOL**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride

**Contra-indications** see under Propranolol Hydrochloride

**Renal impairment** halve dose if eGFR 25–50 mL/minute/1.73 m²; use quarter dose if eGFR less than 25 mL/minute/1.73 m²; do not administer more than once daily

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Propranolol Hydrochloride

**Dose**

- Hypertension, initially 400 mg once daily or 200 mg twice daily, increased after 2 weeks to 400 mg twice daily if necessary
- Angina, initially 400 mg once daily or 200 mg twice daily; 300 mg 3 times daily in severe angina; up to 1.2 g daily has been used
- Arrhythmias, 0.4–1.2 g daily in 2–3 divided doses

**Sectral** (Sanofi-Aventis)

**Capsules**, acebutolol (as hydrochloride) 100 mg (buff/white), net price 84-cap pack = £14.97; 200 mg (buff/pink), 56-cap pack = £19.18. Label: 8

**Tablets**, f/c, acebutolol 400 mg (as hydrochloride), net price 28-tab pack = £18.62. Label: 8

**ATENOLOL**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride

**Contra-indications** see under Propranolol Hydrochloride

**Renal impairment** max. 50 mg daily (10 mg on alternate days intravenously) if eGFR 15–35 mL/minute/1.73 m²; max. 25 mg daily or 50 mg on alternate days (10 mg every 4 days intravenously) if eGFR less than 15 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Propranolol Hydrochloride

**Dose**

- By mouth, hypertension, 25–50 mg daily (higher doses rarely necessary)
- Angina, 100 mg daily in 1 or 2 doses
- Arrhythmias, 50–100 mg daily

Migraine prophylaxis [unlicensed], 50–200 mg daily in divided doses

- By intravenous injection, arrhythmias, 2.5 mg at a rate of 1 mg/minute, repeated at 5-minute intervals to a max. of 10 mg

**Note** Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for overdosage see Emergency Treatment of Poisoning, p 37

- By intravenous infusion, arrhythmias, 150 micrograms/kg over 20 minutes, repeated every 12 hours if required

Early intervention within 12 hours of myocardial infarction (section 2.10.1), by intravenous injection over 5 minutes, 5 mg, then by mouth, 50 mg after 15 minutes, 50 mg after 12 hours, then 100 mg daily

**Atenolol** (Non-proprietary) 

**Tablets**, atenolol 25 mg, net price 28-tab pack = 83p; 50 mg, 28-tab pack = 86p; 100 mg, 28-tab pack = 91p. Label: 8

**Tenormin** (AstraZeneca) 

‘25’ tablets, f/c, atenolol 25 mg, net price 28-tab pack = £1.16. Label: 8

**TS tablets**, orange, f/c, scored, atenolol 50 mg, net price 28-tab pack = £2.94. Label: 8

**Tablets**, orange, f/c, scored, atenolol 100 mg, net price 28-tab pack = £3.46. Label: 8

**Syrup**, sugar-free, atenolol 25 mg/5 mL, net price 300 mL = £8.55. Label: 8

**Injection**, atenolol 500 micrograms/mL, net price 10-mL amp = 96p (hosp. only)

**With diuretic**

**Co-tenidone** (Non-proprietary)

**Tablets**, co-tenidone 50/12.5 (atenolol 50 mg, chlorothalidone 12.5 mg), net price 28-tab pack = £1.77; co-tenidone 100/25 (atenolol 100 mg, chlorothalidone 25 mg), 28-tab pack = £1.57. Label: 8

**Dose** hypertension, 1 tablet daily (but see also under Dose above)

**Kalten** (BPC 100)

**Capsules**, red/ivory, atenolol 50 mg, co-amiloide 2.5/25 (anhydrous amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg), net price 28-cap pack = £12.17. Label: 8

**Dose** hypertension, 1 capsule daily

**Tenoret 50** (AstraZeneca)

**Tablets**, brown, f/c, co-tenidone 50/12.5 (atenolol 50 mg, chlorothalidone 12.5 mg), net price 28-tab pack = £1.15. Label: 8

**Dose** hypertension, 1 tablet daily

**Tenoretic** (AstraZeneca)

**Tablets**, brown, f/c, co-tenidone 100/25 (atenolol 100 mg, chlorothalidone 25 mg), net price 28-tab pack = £1.25. Label: 8

**Dose** hypertension, 1 tablet daily (but see also under Dose above)

**With calcium-channel blocker**

**Note** Only indicated when calcium-channel blocker or beta-blocker alone proves inadequate. For prescribing information on nifedipine see section 2.6.2

**Beta-Adalat** (Bayer Schering)

**Capsules**, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £9.00. Label: 8, 25

**Dose** hypertension, 1 capsule daily, increased if necessary to twice daily. **ELDERLY**: 1 daily

**Angina**, 1 capsule twice daily

**Tenif** (AstraZeneca)

**Capsules**, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £10.63. Label: 8, 25

**Dose** hypertension, 1 capsule daily, increased if necessary to twice daily. **ELDERLY**: 1 daily

**Angina**, 1 capsule twice daily
Bisoprolol Fumarate

Indications see under Dose

Cautions see under Propranolol Hydrochloride; ensure heart failure not worsening before increasing dose

Contra-indications see under Propranolol Hydrochloride; also acute or decompensated heart failure requiring intravenous inotrope; sino-atrial block

Hepatic impairment max. 10 mg daily in severe impairment

Renal impairment reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 10 mg daily)

Pregnancy see notes above

Breast-feeding see notes above

Side-effects postural hypotension, dizziness, headache; occasionally diminished peripheral circulation, peripheral oedema and painful extremities, dry mouth, dry eyes, eye irritation or disturbed vision, impotence, disturbances of micturition, influenza-like symptoms; rarely angina, AV block, exacerbation of intermittent claudication or Raynaud’s phenomenon; allergic skin reactions, exacerbation of psoriasis, nasal stuffiness, wheezing, depressed mood, sleep disturbances, paraesthesia, heart failure, changes in liver enzymes, thrombocytopenia, leucopenia also reported

Dose

- Hypertension, initially 12.5 mg once daily, increased after 2 days to usual dose of 25 mg once daily; if necessary may be further increased at intervals of at least 2 weeks to max. 50 mg daily in single or divided doses

- Angina, initially 12.5 mg twice daily, increased after 2 days to 25 mg twice daily

- Adjunct in heart failure (section 2.5.5) initially 3.125 mg twice daily (with food), dose increased at intervals of at least 2 weeks to 6.25 mg twice daily, then to 12.5 mg twice daily, then to 25 mg twice daily; increase to highest dose tolerated, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg and 50 mg twice daily in patients over 85 kg

Carvedilol (Non-proprietary)

Tablets, carvedilol 3.125 mg, net price 28-tab pack = £1.10; 6.25 mg, 28-tab pack = £1.25; 12.5 mg, 28-tab pack = £1.37; 25 mg, 28-tab pack = £1.84. Label: 8

Eucardic® (Roche)

Tablets, scored, carvedilol 3.125 mg (pink), net price 28-tab pack = £7.13; 6.25 mg (yellow), 28-tab pack = £7.92; 12.5 mg (peach), 28-tab pack = £8.81; 25 mg, 28-tab pack = £11.00. Label: 8

Celliprolol Hydrochloride

Indications mild to moderate hypertension

Cautions see under Propranolol Hydrochloride

Contra-indications see under Propranolol Hydrochloride

Renal impairment reduce dose by half if eGFR 15–40 mL/minute/1.73 m²; avoid if eGFR less than 15 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Side-effects headache, dizziness, fatigue, nausea and somnolence; also bradycardia, bronchospasm; depression and pneumonitis reported rarely

Dose

- 200 mg once daily in the morning, increased to 400 mg once daily if necessary

Celiprolol (Non-proprietary)

Tablets, celiprolol hydrochloride 200 mg, net price 28-tab pack = £4.53; 400 mg, 28-tab pack = £7.13; 600 mg, 28-tab pack = £12.83. Label: 8

Celectol® (Winthrop)

Tablets, scored, celiprolol hydrochloride 200 mg (yellow), net price 28-tab pack = £19.83; 400 mg, 28-tab pack = £39.65. Label: 8, 22
2.4 Beta-adrenoceptor blocking drugs

**ESMOLOL HYDROCHLORIDE**

**Indications** short-term treatment of supraventricular arrhythmias (including atrial fibrillation, atrial flutter, sinus tachycardia); tachycardia and hypertension in peri-operative period.

**Cautions** see under Propranolol Hydrochloride

**Contra-indications** see under Propranolol Hydrochloride

**Renal impairment** manufacturer advises caution

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Propranolol Hydrochloride; also on infusion venous irritation and thrombophlebitis

**Dose**
- By intravenous infusion, usually within range 50–200 micrograms/kg/minute (consult product literature for details of dose titration and doses during peri-operative period)

**Brevibloc® (Baxter)**

Injection, esmolol hydrochloride 10 mg/mL, net price 10-mL vial = £7.79, 250-mL infusion bag = £89.69

**Labetalol Hydrochloride**

**Indications** hypertension (including hypertension in pregnancy; hypertension with angina, and hypertension following acute myocardial infarction); hypertensive crises (see section 2.5); controlled hypotension in anaesthesia

**Cautions** see under Propranolol Hydrochloride; interferes with laboratory tests for catecholamines; liver damage (see below)

**Liver damage** Severe hepatic cellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted

**Contra-indications** see under Propranolol Hydrochloride

**Hepatic impairment** avoid—severe hepatic cellular injury reported

**Renal impairment** dose reduction may be required

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Propranolol Hydrochloride

**Dose**
- By mouth, hypertension, initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses; max. 400 mg daily (but high doses rarely necessary)
- Angina, 50–100 mg 2–3 times daily
- Arrhythmias, usually 50 mg 2–3 times daily; up to 300 mg daily in divided doses if necessary
- Migraine prophylaxis, 100–200 mg daily in divided doses
- Hyperthyroidism (adjunct), 50 mg 4 times daily
- By intravenous injection, arrhythmias, up to 5 mg at rate 1–2 mg/minute, repeated after 5 minutes if necessary, total dose 10–15 mg

**Note** Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for overdosage see Emergency Treatment of Poisoning, p. 37

In surgery, by slow intravenous injection 2–4 mg at induction or to control arrhythmias developing during anaesthesia; 2-mg doses may be repeated to a max. of 10 mg

Early intervention within 12 hours of infarction, by intravenous injection 5 mg every 2 minutes to a max. of 15 mg, followed after 15 minutes by 50 mg by mouth every 6 hours for 48 hours; maintenance 200 mg daily in divided doses

**Metoprolol Tartrate**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride

**Contra-indications** see under Propranolol Hydrochloride

**Hepatic impairment** reduce dose in severe impairment

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Propranolol Hydrochloride

**Dose**
- By mouth, hypertension, initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses; max. 400 mg daily (but high doses rarely necessary)
- Angina, 50–100 mg 2–3 times daily
- Arrhythmias, usually 50 mg 2–3 times daily; up to 300 mg daily in divided doses if necessary
- Migraine prophylaxis, 100–200 mg daily in divided doses
- Hyperthyroidism (adjunct), 50 mg 4 times daily
- By intravenous injection, arrhythmias, up to 5 mg at rate 1–2 mg/minute, repeated after 5 minutes if necessary, total dose 10–15 mg

**Note** Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for overdosage see Emergency Treatment of Poisoning, p. 37

In surgery, by slow intravenous injection 2–4 mg at induction or to control arrhythmias developing during anaesthesia; 2-mg doses may be repeated to a max. of 10 mg

Early intervention within 12 hours of infarction, by intravenous injection 5 mg every 2 minutes to a max. of 15 mg, followed after 15 minutes by 50 mg by mouth every 6 hours for 48 hours; maintenance 200 mg daily in divided doses

**Metoprolol Tartrate** (Non-proprietary)

Tablets, metoprolol tartrate 50 mg, net price 28 = £1.31, 56 = £1.74; 100 mg, 28 = £1.59, 56 = £2.51. Label: 8

**Betaloc® (AstraZeneca)**

Injection, metoprolol tartrate 1 mg/mL, net price 5-mL amp = £4.2p

**Lopresor® (Novartis)**

Tablets, f/c, scored, metoprolol tartrate 50 mg (pink), net price 56-tab pack = £2.57; 100 mg (blue), 56-tab pack = £6.68. Label: 8
2.4 Beta-adrenoceptor blocking drugs

NADOLOL

Indications see under Dose
Cautions see under Propranolol Hydrochloride
Contra-indications see under Propranolol Hydrochloride
Hepatic impairment manufacturer advises caution
Renal impairment increase dosage interval if eGFR less than 50 mL/minute/1.73 m²
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Propranolol Hydrochloride
Dose
- Hypertension, initially 80 mg once daily, increased in increments of up to 80 mg at weekly intervals if required; max. 240 mg daily (higher doses rarely necessary)
- Angina, initially 40 mg once daily, increased at weekly intervals if required; usual max. 160 mg daily (rarely up to 240 mg may be required)
- Arrhythmias, initially 40 mg once daily, increased at weekly intervals up to 160 mg if required; reduce to 40 mg if bradycardia occurs
- Migraine prophylaxis, initially 40 mg once daily, increased in 40 mg increments at weekly intervals according to response; usual maintenance dose 80–160 mg once daily
- Thyrotoxicosis (adjunct), 80–160 mg once daily
Corgard® (Sanofi-Aventis) Tablets, blue, scored, nadolol 80 mg, net price 28-tab pack = £5.00. Label: 8.

NEBIVOLOL

Indications essential hypertension; adjunct in stable mild to moderate heart failure in patients over 70 years
Cautions see under Propranolol Hydrochloride
Contra-indications see under Propranolol Hydrochloride; also acute or decompensated heart failure requiring intravenous inotropes
Hepatic impairment no information available—manufacturer advises avoid
Renal impairment for hypertension, initially 2.5 mg once daily, increased to 5 mg once daily if required; for heart failure, manufacturer advises avoid if serum creatinine greater than 250 micromol/litre
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Propranolol Hydrochloride; also oedema and depression
Dose
- Hypertension, 5 mg daily; ELDERLY initially 2.5 mg daily, increased if necessary to 5 mg daily
- Adjunct in heart failure (section 2.5.5), initially 1.25 mg once daily, then if tolerated increased at intervals of 1–2 weeks to 2.5 mg once daily, then to 5 mg once daily, then to max. 10 mg once daily

Nebivolol (Non-proprietary) Tablets, nebivolol (as hydrochloride) 5 mg, net price 28-tab pack = £3.98. Label: 8.
Nebilet® (Menarini) Tablets, scored, nebivolol (as hydrochloride) 5 mg, net price 28-tab pack = £9.23. Label: 8.
Note Also available as Hypoloc™.

OXPRENOLOL HYDROCHLORIDE

Indications see under Dose
Cautions see under Propranolol Hydrochloride

Dose
- Hypertension, 80–160 mg daily in 2–3 divided doses, increased as required; max. 320 mg daily
- Angina, 80–160 mg daily in 2–3 divided doses; max. 320 mg daily
- Arrhythmias, 40–240 mg daily in 2–3 divided doses; max. 240 mg daily
- Anxiety symptoms (short-term use), 40–80 mg daily in 1–2 divided doses

Oxproprenol (Non-proprietary) Tablets, coated, oxproprenol hydrochloride 20 mg, net price 56-tab pack = £1.86; 40 mg, 56-tab pack = £3.73; 80 mg, 56-tab pack = £6.20; 160 mg, 20-tab pack = £2.36. Label: 8.
Trasicor® (Amdipharm) Tablets, f/c, oxproprenol hydrochloride 20 mg (contain gluten), net price 56-tab pack = £1.86; 40 mg (contain gluten), 56-tab pack = £3.73; 80 mg (yellow), 56-tab pack = £6.20. Label: 8.

Note See also pindolol.

PINDOLOL

Indications see under Dose
Cautions see under Propranolol Hydrochloride
Contra-indications see under Propranolol Hydrochloride
Renal impairment may adversely affect renal function in severe impairment—manufacturer advises avoid
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Propranolol Hydrochloride

Nebilet (Menarini) Tablets, m/r, oxprenolol hydrochloride 160 mg, net price 56-tab pack = £1.86; 200 mg, 56-tab pack = £3.73; 400 mg, 56-tab pack = £6.20. Label: 8.

Modified release

Lopresor SR® (Recordati) Tablets, m/r, yellow, f/c, metoprolol tartrate 200 mg, net price 28-tab pack = £9.80. Label: 8, 25
Dose hypertension, 200 mg daily; angina, 200–400 mg daily; migraine prophylaxis, 200 mg daily
### Hypertension and heart failure

#### Dose
- **Hypertension**, initially 5 mg 2–3 times daily or 15 mg once daily, increased as required at weekly intervals; usual maintenance 15–30 mg daily; max. 45 mg daily
- **Angina**, 2.5–5 mg up to 3 times daily

**Pindolol** (Non-proprietary)  
**Tablets**, pindolol 5 mg, net price 100-tab pack = £7.81. Label: 8

**Visken** (Amdipharm)  
**Tablets**, scored, pindolol 5 mg, net price 56-tab pack = £5.85; 15 mg, 28-tab pack = £8.79. Label: 8

### TIMOLOL MALEATE

#### Indications
- see under Dose; glaucoma (section 11.6)

#### Cautions
- see under Propranolol Hydrochloride

#### Contra-indications
- see under Propranolol Hydrochloride

#### Hepatic impairment
- dose reduction may be necessary

#### Renal impairment
- manufacturer advises caution—dose reduction may be required

#### Pregnancy
- see notes above

#### Breast-feeding
- see notes above

#### Side-effects
- see under Propranolol Hydrochloride

### SOTALOL HYDROCHLORIDE

#### Indications
- life-threatening arrhythmias including ventricular tachyarrhythmias; symptomatic non-sustained ventricular tachyarrhythmias; prophylaxis of paroxysmal atrial tachycardia or fibrillation; paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery; maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter

#### Cautions
- see under Propranolol Hydrochloride; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances; severe or prolonged diarrhoea; interactions: Appendix 1 (beta-blockers), important: verapamil interaction see also p. 133

#### Contra-indications
- see under Propranolol Hydrochloride; congenital or acquired long QT syndrome; tonsade de pointes; renal failure

#### Renal impairment
- use half normal dose if eGFR 30–60 mL/minute/1.73 m²; use one-quarter normal dose if eGFR 10–30 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²

#### Pregnancy
- see notes above

#### Breast-feeding
- see notes above

#### Side-effects
- see under Propranolol Hydrochloride; arrhythmogenic (pro-arrhythmic) effect (tonsade de pointes—increased risk in women)

#### Dose
- **By mouth** with ECG monitoring and measurement of corrected QT interval, arrhythmias, initially 80 mg daily in 1–2 divided doses increased gradually at intervals of 2–3 days to usual dose of 160–320 mg daily in 2 divided doses; higher doses of 480–640 mg daily for life-threatening ventricular arrhythmias under specialist supervision

**Sotalol** (Non-proprietary)  
**Tablets**, sotalol hydrochloride 40 mg, net price 56 = £1.29; 80 mg, 56 = £1.91; 160 mg, 28 = £2.32. Label: 8

**Beta-Cardone** (UCB Pharma)  
**Tablets**, scored, sotalol hydrochloride 40 mg (green), net price 56-tab pack = £1.29; 80 mg (pink), 56-tab pack = £1.91; 200 mg, 28-tab pack = £2.40. Label: 8

**Sotacor** (Bristol-Myers Squibb)  
**Tablets**, scored, sotalol hydrochloride 80 mg, net price 28-tab pack = £3.06. Label: 8

### 2.5 Hypertension and heart failure

#### Hypertension
- Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of the Joint British Societies (JBS2: British Societies’ guidelines on prevention of cardiovascular disease in clinical practice. Heart 2005; 91 (Suppl V): v1–v52).
- Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle
2. Cardiovascular system

2.5 Hypertension and heart failure

Changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

Thresholds and targets for treatment The following thresholds for treatment are recommended:

- Severe hypertension with acute target-organ damage causes prompt treatment (systolic blood pressure ≥180 mmHg or diastolic ≥110 mmHg) without acute target-organ damage, treat promptly (see Hypertensive crises, p. 106).
- When the initial blood pressure is systolic 160–179 mmHg or diastolic 100–109 mmHg, and the patient has cardiovascular complications, target-organ damage (e.g. left ventricular hypertrophy, renal impairment) or diabetes mellitus (type 1 or 2), confirm over 3–4 weeks then treat if these values are sustained;
- When the initial blood pressure is systolic 160–179 mmHg or diastolic 100–109 mmHg, but the patient has no cardiovascular complications, no target-organ damage, or no diabetes, advise lifestyle changes, reassess weekly initially and treat if these values are sustained on repeat measurements over 4–12 weeks;
- When the initial blood pressure is systolic 140–159 mmHg or diastolic 90–99 mmHg and the patient has cardiovascular complications, target-organ damage or diabetes, confirm within 12 weeks and treat if these values are sustained;
- When the initial blood pressure is systolic 140–159 mmHg or diastolic 90–99 mmHg and no cardiovascular complications, no target-organ damage, or no diabetes, advise lifestyle changes and reassess monthly; treat persistent mild hypertension if the 10-year cardiovascular disease risk is 20% or more.  

A target systolic blood pressure < 140 mmHg and diastolic blood pressure < 90 mmHg is suggested. A lower target systolic blood pressure < 130 mmHg and diastolic blood pressure < 80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, diabetes, or chronic renal failure. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

Drug treatment of hypertension Response to drug treatment for hypertension may be affected by the patient’s age and ethnic background. An ACE inhibitor (section 2.5.5.1) or an angiotensin-II receptor antagonist (section 2.5.5.2) may be the most appropriate initial drug in younger Caucasians; however a beta-blocker may be considered if an ACE inhibitor or an angiotensin-II receptor antagonist is not tolerated or is contraindicated (see also Hypertension in Pregnancy).

1. Thresholds and targets for treatment based on blood pressure measured in clinic may not apply to ambulatory or home blood-pressure monitoring, which usually give lower values.

2. Cardiovascular disease risk may be determined from the chart issued by the Joint British Societies (Heart 2005; 91 Suppl V: v1–v52)—see inside back cover. The Joint British Societies’ ‘Cardiac Risk Assessor’ computer program may also be used to determine cardiovascular disease risk.

P. 106). Afro-Caribbean patients and those aged over 55 years respond less well to ACE inhibitors and angiotensin-II receptor antagonists, therefore a thiazide (section 2.2.1) or a calcium-channel blocker (section 2.6.2) may be chosen for initial treatment.

Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes. A single antihypertensive drug is often not adequate and other antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently, an interval of at least 4 weeks should be allowed to determine response.

When two antihypertensive drugs are needed, an ACE inhibitor or an angiotensin-II receptor antagonist can be combined with either a thiazide or a calcium-channel blocker.

If control is inadequate with 2 drugs, a thiazide and a calcium-channel blocker can be added. The addition of an alpha-blocker (section 2.5.4), spironolactone, another diuretic, or a beta-blocker should be considered in resistant hypertension. In patients with primary hyperaldosteronism, spironolactone (section 2.2.3) is effective.

Other measures to reduce cardiovascular risk

Aspirin (section 2.9) in a dose of 75 mg daily reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease. Use of aspirin in primary prevention, in those with or without diabetes, is of unproven benefit (see also section 2.9).

Lipid-regulating drugs can also be of benefit in cardiovascular disease or in those who are at high risk of developing cardiovascular disease (section 2.12).

Hypertension in the elderly Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. The thresholds for treatment are diastolic pressure averaging ≥ 90 mmHg or systolic pressure averaging ≥ 160 mmHg over 3 to 6 months’ observation (despite appropriate lifestyle interventions). Treatment with a low dose of a thiazide or a dihydropyridine calcium-channel blocker is effective. An ACE inhibitor (or an angiotensin-II receptor antagonist) (section 2.5.5) can be added if necessary.

Isolated systolic hypertension Isolated systolic hypertension (systolic pressure ≥ 160 mmHg, diastolic pressure < 90 mmHg) is associated with an increased cardiovascular disease risk, particularly in those aged over 60 years. Systolic blood pressure averaging 160 mmHg or higher over 3 to 6 months (despite appropriate lifestyle interventions) should be lowered in those over 60 years, even if diastolic hypertension is absent. Treatment with a low dose of a thiazide or a dihydropyridine calcium-channel blocker is effective. An ACE inhibitor (or an angiotensin-II receptor antagonist) (sec-
Hypertension in diabetes

For patients with diabetes, the aim should be to maintain systolic pressure < 130 mmHg and diastolic pressure < 80 mmHg. However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension is common in type 2 diabetes, and antihypertensive treatment prevents macrovascular and microvascular complications. In type 1 diabetes, hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy (section 6.1.5); in patients with type 2 diabetes, an ACE inhibitor (or an angiotensin-II receptor antagonist) can delay progression of microalbuminuria to nephropathy.

Hypertension in renal disease

The threshold for antihypertensive treatment in patients with renal impairment or persistent proteinuria is a systolic blood pressure > 140 mmHg or a diastolic blood pressure > 90 mmHg. Optimal blood pressure is a systolic blood pressure < 130 mmHg and a diastolic pressure < 80 mmHg, or lower if proteinuria exceeds 1 g in 24 hours. An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment, see section 2.5.5.1. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required. A dihydropyridine calcium channel blocker can be added.

Hypertension in pregnancy

Hypertensive complications in pregnancy can be hazardous for both the mother and the fetus, and are associated with a significant risk of morbidity and mortality; complications can occur in pregnant women with pre-existing chronic hypertension, or in those who develop hypertension in the latter half of pregnancy.

Labetalol (section 2.4) is widely used for treating hypertension in pregnancy. Methyldopa (section 2.5.2) is considered safe for use in pregnancy. Modified-release preparations of nifedipine [unlicensed] are also used, but see section 2.6.2 (p. 132) for warnings on use during pregnancy.

The following advice takes into account the recommendations of NICE Clinical Guideline 107 (August 2010), Hypertension in Pregnancy.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should have their drug therapy reviewed. In uncomplicated chronic hypertension, a target blood pressure of <150/100 mmHg is recommended; women with target-organ damage as a result of chronic hypertension, and in women with chronic hypertension who have given birth, a target blood pressure of <140/90 mmHg is advised. Long-term antihypertensive treatment should be reviewed 2 weeks following the birth. Women managed with methyldopa during pregnancy should discontinue treatment and restart their original antihypertensive medication within 2 days of the birth.

Pregnant women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin (section 2.9) in a dose of 75 mg once daily [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor (first pregnancy, aged ≥40 years, pregnancy interval >10 years, BMI ≥35 kg/m² at first visit, multiple pregnancy, or family history of pre-eclampsia) for developing pre-eclampsia are also advised to take aspirin 75 mg once daily [unlicensed indication] from week 12 of pregnancy until the baby is born.

Women with pre-eclampsia or gestational hypertension who present with a blood pressure over 150/100 mmHg should receive initial treatment with oral labetalol to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. If labetalol is unsuitable, methyldopa or modified-release nifedipine may be considered. Women with gestational hypertension or pre-eclampsia who have been managed with methyldopa during pregnancy should discontinue treatment within 2 days of the birth. Women with a blood pressure of ≥160/110 mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol, intravenous hydralazine (section 2.5.1), or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg.

For use of magnesium sulphate in pre-eclampsia and eclampsia, see section 9.5.1.3.

Hypertensive crises

If blood pressure is reduced too quickly in the management of hypertensive crises, there is a risk of reduced organ perfusion leading to cerebral infarction, blindness, deterioration in renal function, and myocardial ischaemia.

A hypertensive emergency is defined as severe hypertension with acute damage to the target organs (e.g. signs of papilloedema or retinal haemorrhage, or the presence of clinical conditions such as acute coronary syndromes, acute aortic dissection, acute pulmonary oedema, hypertensive encephalopathy, acute cerebral infarction, intracerebral or subarachnoid haemorrhage, eclampsia, or rapidly progressing renal failure); prompt treatment with intravenous antihypertensive therapy is generally required. Over the first few minutes or within 2 hours, blood pressure should be reduced by 20–25%.

When intravenous therapy is indicated, treatment options include sodium nitroprusside [unlicensed] (section 2.5.1), labetalol (section 2.4), glyceryl trinitrate (section 2.6.1), phentolamine (section 2.5.4), hydralazine (section 2.5.1), or esmolol (section 2.4); choice of drug is dependent on concomitant conditions and clinical status of the patient.

Severe hypertension (blood pressure ≥180/110 mmHg) without acute target-organ damage is defined as a hypertensive urgency; blood pressure should be reduced gradually over 24–48 hours with oral antihypertensive therapy, such as labetalol, or the calcium-channel block-
2.5.1 Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. Important: for a warning on the hazards of a very rapid fall in blood pressure, see Hypertensive crises, p. 106.

Diazoxide has been used by intravenous injection in hypertensive emergencies, however alternative treatments are preferred (see section 2.5).

Hydralazine is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention. The incidence of side-effects is lower if the dose is kept below 100 mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

Sodium nitroprusside [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for women.

Prazosin, doxazosin, and terazosin (section 2.5.4) have alpha-blocking and vasodilator properties.

Ambrisentan, bosentan, iloprost, sildenafil, sitaxentan, and tadalafil are licensed for the treatment of pulmonary arterial hypertension and should be used under specialist supervision. Epoprostenol (section 2.8.1) can be used in patients with primary pulmonary hypertension resistant to other treatments. Bosentan is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease.

The Scottish Medicines Consortium (p. 4) has advised (November 2005) that iloprost (Ventavis®) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

The Scottish Medicines Consortium (p. 4) has advised (October 2008) that ambrisentan (Volibris®) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

The Scottish Medicines Consortium (p. 4) has advised (January 2010) that sildenafil (Revatio®) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

Sitaxentan

Sitaxentan (Thelin®) is to be withdrawn from worldwide markets due to severe, sometimes fatal, hepatotoxicity; the benefits of treatment with sitaxentan no longer outweigh the risks. Patients currently taking sitaxentan are advised not to stop until their treatment has been reviewed by their prescriber; patients should be switched to a suitable alternative as soon as possible. Patients with abnormal liver function tests at the time of sitaxentan discontinuation should be monitored regularly until liver enzymes return to within the normal range.

**AMBRISENTAN**

Indications pulmonary arterial hypertension

Cautions not to be initiated in significant anaemia; monitor haemoglobin concentration or haematocrit after 1 month and 3 months of starting treatment, and periodically thereafter (reduce dose or discontinue treatment if significant decrease in haemoglobin concentration or haematocrit observed); monitor liver function before treatment, and monthly thereafter—discontinue if liver enzymes raised significantly or if symptoms of liver impairment develop

Hepatic impairment avoid in severe impairment

Renal impairment use with caution if eGFR less than 30 mL/minute/1.73 m²

Pregnancy avoid (teratogenic in animal studies); exclude pregnancy before treatment and ensure effective contraception during treatment; monthly pregnancy tests advised

Breast-feeding manufacturer advises avoid—no information available

Side-effects abdominal pain, constipation; palpitation, flushing, peripheral oedema; upper respiratory-tract disorders; headache; anaemia; less commonly hypersensitivity reactions (including angioedema and rash)

Dose

- **ADULT** over 18 years, 5 mg once daily, increased if necessary to 10 mg once daily

Volibris® (GSK) ▼ Tablet, f/c, ambrisentan 5 mg (pale pink), net price 30-tab pack = £1618.08; 10 mg (dark pink), 30-tab pack = £1618.08

**BOSENTAN**

Indications pulmonary arterial hypertension; systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)

Cautions not to be initiated if systemic systolic blood pressure is below 85 mmHg; monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly); avoid abrupt withdrawal; monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment; interactions: Appendix 1 (bosentan)

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment avoid in moderate and severe impairment
Pregnancy avoid (teratogenic in animal studies); effective contraception required during and for at least 3 months after administration (hormonal contraception not considered effective); monthly pregnancy tests advised

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastrointestinal disturbances, dry mouth, rectal haemorrhage, hepatic impairment (see Cautions; above); flushing, hypotension, palpitation, oedema, chest pain; dyspnoea; headache, dizziness, fatigue; back pain and pain in extremities; anaemia; hypersensitivity reactions (including rash, pruritus, and anaphylaxis)

Dose
- Pulmonary arterial hypertension, initially 62.5 mg twice daily increased after 4 weeks to 125 mg twice daily; CHILD under 12 twice daily
- Systemic sclerosis with ongoing digital ulcer disease, initially 62.5 mg twice daily increased after 4 weeks to 125 mg twice daily

Tracleer® (Actelion) ▼ ▽
- Tablets, 2.5 mg/mL, yellow, s/c, diazoxide 15 mg/mL, net price 20-mL amp = £8.26
- Injection, diazoxide 15 mg/mL, net price 20-mL amp = £20.00

HYDRAZINE HYDROCHLORIDE

Indications moderate to severe hypertension (adjunct); heart failure (with long-acting nitrate, but see section 2.5.5); hypertensive emergencies (including during pregnancy) (see section 2.5)

Cautions coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised); cerebrovascular disease; occasionally blood pressure reduction too rapid even with low parental doses; manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose above 100 mg daily, but evidence of clinical value unsatisfactory; interactions: Appendix 1 (hydralazine)

Contra-indications idiopathic systemic lupus erythematosus, severe tachycardia, high output heart failure, myocardial insufficiency due to mechanical obstruction, cor pulmonale, dissecting aortic aneurysm; acute porphyria (section 9.8.2)

Hepatic impairment reduce dose

Renal impairment reduce dose if eGFR less than 30 mL/minute/1.73 m²

Pregnancy neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension; manufacturer advises avoid before third trimester

Breast-feeding present in milk but not known to be harmful; monitor infant

Side-effects tachycardia, palpitation, flushing, hypotension, fluid retention, gastro-intestinal disturbances; headache, dizziness; systemic lupus erythematosus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals) (see also notes above); rarely rashes, fever, peripheral neuritis, polynuertitis, paraesthesia, arthralgia, myalgia, increased lacrimation, nasal congestion, dyspnoea, agitation, anxiety, anorexia; blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia), abnormal liver function, jaundice, raised plasma creatinine, proteinuria and haematuria reported

Dose
- By mouth, hypertension, 25 mg twice daily, increased to usual max. 50 mg twice daily (see notes above)
  - Heart failure (initiated in hospital) 25 mg 3–4 times daily, increased every 2 days if necessary; usual maintenance dose 50–75 mg 4 times daily
  - By slow intravenous injection, hypertensive emergencies and hypertension with renal complications, 5–10 mg diluted with 10 mL sodium chloride 0.9%; may be repeated after 20–30 minutes (see Cautions)
  - By intravenous infusion, hypertensive emergencies and hypertension with renal complications, initially 200–300 micrograms/minute; maintenance usually 50–150 micrograms/minute

Hydralazine (Non-proprietary) ▽
- Tablets, hydralazine hydrochloride 25 mg, net price 56 = £9.32; 50 mg, 56 = £16.84
- Apresoline® (Amidipharm) ▽
  - Tablets, yellow, s/c, hydralazine hydrochloride 25 mg, net price 84-tab pack = £3.38
  - Excipients include gluten

Injection, powder for reconstitution, hydralazine hydrochloride, net price 20-mg amp = £2.22

ILOPROST

Indications idiopathic or familial pulmonary arterial hypertension

Cautions unstable pulmonary hypertension with advanced right heart failure; hypotension (do not initiate if systolic blood pressure below 85 mmHg); acute pulmonary infection; chronic obstructive pulmonary disease; severe asthma; interactions: Appendix 1 (iloprost)

Contra-indications unstable angina; within 6 months of myocardial infarction; decompensated cardiac failure (unless under close medical supervision);
severe arrhythmias; congenital or acquired heart-valve defects; within 3 months of cerebrovascular events; pulmonary veno-occlusive disease; conditions which increase risk of bleeding

**Hepatic impairment** elimination reduced—initially 2.5 micrograms no more frequently than every 3 hours (max. 6 times daily), adjusted according to response (consult product literature)

**Pregnancy** manufacturer advises avoid (toxicity in animal studies); effective contraception must be used during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** vasodilatation, hypotension, syncope, cough, headache, throat or jaw pain; nausea, vomiting, diarrhoea, chest pain, dyspnoea, bronchospasm, and wheezing also reported

**Dose**
- By inhalation of nebulised solution, initial dose 2.5 micrograms increased to 5 micrograms for second dose, if tolerated maintain at 5 micrograms 6–9 times daily according to response; reduce to 2.5 micrograms 6–9 times daily if higher dose not tolerated; CHILD 8–18 years see **BNF for Children**

**Ventavis®** (Bayer Schering) \( ^{TM} \)
**Nebuliser solution**, iloprost (as trometamol)
10 micrograms/mL, net price 30 \( \times \) 1-mL (10-microgram unit-dose vials = £400.19, 168 \( \times \) 1-mL = £2241.08. For use with **Prodose** or **Venta-Neb** nebuliser

---

**MINOXIDIL**

**Indications** severe hypertension, in addition to a diuretic and a beta-blocker

**Cautions** see notes above: angina; after myocardial infarction (until stabilised); lower doses in dialysis patients; acute porphyria (section 9.8.2); interactions: Appendix 1 (vasodilator antihypertensives)

**Contra-indications** phaeochromocytoma

**Renal impairment** use with caution in significant impairment

**Pregnancy** avoid—possible toxicity including reduced placental perfusion; neonatal hirsutism reported

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** sodium and water retention; weight gain, peripheral oedema, tachycardia, hypertrichosis; reversible rise in creatinine and blood urea nitrogen; occasionally, gastro-intestinal disturbances, breast tenderness, rashes

**Dose**
- Initially 5 mg (ELDERLY, 2.5 mg) daily, in 1–2 divided doses, increased in steps of 5–10 mg at intervals of at least 3 days; max. 100 mg daily (seldom necessary to exceed 50 mg daily)

**Loniten®** (Pharmacia) \( ^{TM} \)
**Tablets**, scored, minoxidil 2.5 mg, net price 60-tab pack = £8.88; 5 mg, 60-tab pack = £15.83; 10 mg, 60-tab pack = £30.68

---

**SILDENAFIL**

**Indications** pulmonary arterial hypertension; erectile dysfunction (section 7.4.5)

**Cautions** hypotension (avoid if systolic blood pressure below 90 mmHg); intravascular volume depletion; left ventricular outflow obstruction; cardiovascular disease; autonomic dysfunction; pulmonary veno-occlusive disease; anatomical deformation of the penis, predisposition to priapism; bleeding disorders or active peptic ulceration; consider gradual withdrawal; interactions: Appendix 1 (sildenafil)

**Contra-indications** recent history of stroke or myocardial infarction, history of non-arteritic anterior ischaemic optic neuropathy; hereditary degenerative retinal disorders; avoid concomitant use of nitrates

**Hepatic impairment** for pulmonary hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily, or reduce intravenous dose to 10 mg twice daily; manufacturer advises avoid in severe impairment

**Renal impairment** for pulmonary hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily, or reduce intravenous dose to 10 mg twice daily

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no evidence of harm in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances, dry mouth; flushing, oedema; bronchitis; cough; headache, migraine, night sweats, paraesthesia, insomnia; anxiety, tremor, vertigo; fever, influenza-like symptoms; anaemia; back and limb pain, myalgia; visual disturbances, retinal haemorrhage, photophobia, painful red eyes; nasal congestion, epistaxis; cellulitis, alopecia; less commonly gynaecomastia, priapism; also reported rash, retinal vascular occlusion and non-arteritic anterior ischaemic optic neuropathy (discontinue if sudden visual impairment), and sudden hearing loss (advise patient to seek medical help)

**Dose**
- By mouth, 20 mg 3 times daily; CHILD under 18 years see **BNF for Children**
- By intravenous injection, when oral route not appropriate, 10 mg three times daily

**Revatio®** (Pfizer) \( ^{TM} \)
**Tablets**, f/c, sildenafil (as citrate), 20 mg, net price 90-tab pack = £373.50
**Injection**, sildenafil (as citrate), 800 micrograms/mL, net price 50-mL vial = £45.28

**Viagra®** (Pfizer) \( ^{TM} \)
Section 7.4.5 (erectile dysfunction)

---

**SITAXENTAN SODIUM**

**Indications** pulmonary arterial hypertension (but see notes above)

**Cautions** test liver function before treatment and monitor monthly during treatment (discontinue treatment if liver enzymes significantly raised); measure haemoglobin concentration before treatment, after 1–3 months, then every 3 months; interactions: Appendix 1 (sitaxentan)

**Hepatic impairment** avoid

**Pregnancy** avoid unless essential—toxicity in animal studies; manufacturer advises effective contraception during treatment

---
2.5.2 Centrally acting antihypertensive drugs

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects gastro-intestinal disturbances; peripheral oedema, flushing; headache, insomnia, fatigue, dizziness; decreased haemoglobin, prolonged prothrombin time, increased INR; muscle cramp; nasal congestion, epistaxis

Dose
  • ADULT over 18 years 100 mg once daily

Thelin® (Encysive) ▼ (BNF)

Tablets, f/c, yellow-orange, sitaxentan sodium 100 mg, net price 28-tab pack = £1540.00

Note All orders of Thelin should be based on a prescription from a specialist in Pulmonary Arterial Hypertension, who has received appropriate training as part of the Programmed Access to Sitaxentan Sodium (PASS) scheme. Orders should be placed with Polarspeed at 01525 217211

Sodium Nitroprusside

Indications hypertensive emergencies (see section 2.5); controlled hypotension in anaesthesia; acute or chronic heart failure

Cautions hypothyroidism, hyponaetraemia, ischaemic heart disease, impaired cerebral circulation, elderly; hypothermia; monitor blood pressure and blood-cyanide concentration and if treatment exceeds 3 days, also blood-thiocyanate concentration; avoid sudden withdrawal—terminate infusion over 15–30 minutes; protect infusion from light; interactions: Appendix 1 (sodium nitroprusside)

Contra-indications severe vitamin B12 deficiency; Leber’s optic atrophy; compensatory hypertension

Hepatic impairment use with caution; avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate

Renal impairment avoid prolonged use—cyanide or thiocyanate metabolites may accumulate

Pregnancy avoid prolonged use—potential for accumulation of cyanide in fetus

Breast-feeding no information available; caution advised due to thiocyanate metabolite

Side-effects associated with rapid reduction in blood pressure (reduce infusion rate): headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort; occasionally reduced platelet count, acute transient phlebitis

Cyanide Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, hypertension, seizures, myalgia, back and limb pain, increased uterine bleeding, blurred vision, facial oedema, rash; less commonly tachycardia, hypertension, seizures, amnesia, priapism, hyperhidrosis; also reported unstable angina, arrhythmia, myocardial infarction, stroke, hearing loss, non-arteritic anterior ischaemic optic neuropathy, visual field defect, Stevens-Johnson syndrome

Dose
  • ADULT over 18 years 40 mg once daily

Adcirca® (Lilly) ▼ (BNF)

Tablets, f/c, tadalafil 20 mg (orange), net price 56-tab pack = £491.22

Tadalafil

Indications pulmonary arterial hypertension; erectile dysfunction (section 7.4.5)

Cautions hypotension (avoid if systolic blood pressure below 90 mmHg); aortic and mitral valve disease; pericardial constriction; congestive cardiomyopathy; left ventricular dysfunction; life-threatening arrhythmias; coronary artery disease; uncontrolled hypertension; pulmonary veno-occlusive disease; predisposition to priapism; anatomical deformation of the penis; hereditary degenerative retinal disorders; interactions: Appendix 1 (tadalafil)

Contra-indications acute myocardial infarction in past 90 days; history of non-arteritic anterior ischaemic optic neuropathy; avoid concomitant use of nitrates

Hepatic impairment initially 20 mg once daily in mild to moderate impairment; avoid in severe impairment

Renal impairment initially 20 mg once daily in mild to moderate impairment, increased to 40 mg once daily if tolerated; avoid in severe impairment

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects nausea, vomiting, dyspepsia, gastrooesophageal reflux, chest pain, palpitation, flushing, hypotension, nasopharyngitis, epistaxis, headache, myalgia, back and limb pain, increased uterine bleeding, blurred vision, facial oedema, rash; less commonly tachycardia, hypertension, seizures, amnesia, priapism, hyperhidrosis; also reported unstable angina, arrhythmia, myocardial infarction, stroke, hearing loss, non-arteritic anterior ischaemic optic neuropathy, retinal vascular occlusion, visual field defect, Stevens-Johnson syndrome

Dose
  • ADULT over 18 years 100 mg once daily

Methyl Dopamine 100 mg, net price 28-tab pack = £1540.00

Note All orders of Thelin should be based on a prescription from a specialist in Pulmonary Arterial Hypertension, who has received appropriate training as part of the Programmed Access to Sitaxentan Sodium (PASS) scheme. Orders should be placed with Polarspeed at 01525 217211

SODIUM NITROPRUSSIDE

Indications hypertensive emergencies (see section 2.5); controlled hypotension in anaesthesia; acute or chronic heart failure

Cautions hypothyroidism, hyponaetraemia, ischaemic heart disease, impaired cerebral circulation, elderly; hypothermia; monitor blood pressure and blood-cyanide concentration and if treatment exceeds 3 days, also blood-thiocyanate concentration; avoid sudden withdrawal—terminate infusion over 15–30 minutes; protect infusion from light; interactions: Appendix 1 (sodium nitroprusside)

Contra-indications severe vitamin B12 deficiency; Leber’s optic atrophy; compensatory hypertension

Hepatic impairment use with caution; avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate

Renal impairment avoid prolonged use—cyanide or thiocyanate metabolites may accumulate

Pregnancy avoid prolonged use—potential for accumulation of cyanide in fetus

Breast-feeding no information available; caution advised due to thiocyanate metabolite

Side-effects associated with rapid reduction in blood pressure (reduce infusion rate): headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort; occasionally reduced platelet count, acute transient phlebitis

Cyanide Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, hypertension, seizures, myalgia, back and limb pain, increased uterine bleeding, blurred vision, facial oedema, rash; less commonly tachycardia, hypertension, seizures, amnesia, priapism, hyperhidrosis; also reported unstable angina, arrhythmia, myocardial infarction, stroke, hearing loss, non-arteritic anterior ischaemic optic neuropathy, visual field defect, Stevens-Johnson syndrome

Dose
  • ADULT over 18 years 40 mg once daily

Adcirca® (Lilly) ▼ (BNF)

Tablets, f/c, tadalafil 20 mg (orange), net price 56-tab pack = £491.22

Tadalafil

Indications pulmonary arterial hypertension; erectile dysfunction (section 7.4.5)

Cautions hypotension (avoid if systolic blood pressure below 90 mmHg); aortic and mitral valve disease; pericardial constriction; congestive cardiomyopathy; left ventricular dysfunction; life-threatening arrhythmias; coronary artery disease; uncontrolled hypertension; pulmonary veno-occlusive disease; predisposition to priapism; anatomical deformation of the penis; hereditary degenerative retinal disorders; interactions: Appendix 1 (tadalafil)

Contra-indications acute myocardial infarction in past 90 days; history of non-arteritic anterior ischaemic optic neuropathy; avoid concomitant use of nitrates

Hepatic impairment initially 20 mg once daily in mild to moderate impairment; avoid in severe impairment

Renal impairment initially 20 mg once daily in mild to moderate impairment, increased to 40 mg once daily if tolerated; avoid in severe impairment

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects nausea, vomiting, dyspepsia, gastro-oesophageal reflux, chest pain, palpitation, flushing, hypotension, nasopharyngitis, epistaxis, headache, myalgia, back and limb pain, increased uterine bleeding, blurred vision, facial oedema, rash; less commonly tachycardia, hypertension, seizures, amnesia, priapism, hyperhidrosis; also reported unstable angina, arrhythmia, myocardial infarction, stroke, hearing loss, non-arteritic anterior ischaemic optic neuropathy, retinal vascular occlusion, visual field defect, Stevens-Johnson syndrome

Dose
  • ADULT over 18 years 100 mg once daily

Methyl Dopamine 100 mg, net price 28-tab pack = £1540.00

Note All orders of Thelin should be based on a prescription from a specialist in Pulmonary Arterial Hypertension, who has received appropriate training as part of the Programmed Access to Sitaxentan Sodium (PASS) scheme. Orders should be placed with Polarspeed at 01525 217211

SODIUM NITROPRUSSIDE

Indications hypertensive emergencies (see section 2.5); controlled hypotension in anaesthesia; acute or chronic heart failure

Cautions hypothyroidism, hyponaetraemia, ischaemic heart disease, impaired cerebral circulation, elderly; hypothermia; monitor blood pressure and blood-cyanide concentration and if treatment exceeds 3 days, also blood-thiocyanate concentration; avoid sudden withdrawal—terminate infusion over 15–30 minutes; protect infusion from light; interactions: Appendix 1 (sodium nitroprusside)

Contra-indications severe vitamin B12 deficiency; Leber’s optic atrophy; compensatory hypertension

Hepatic impairment use with caution; avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate

Renal impairment avoid prolonged use—cyanide or thiocyanate metabolites may accumulate

Pregnancy avoid prolonged use—potential for accumulation of cyanide in fetus

Breast-feeding no information available; caution advised due to thiocyanate metabolite

Side-effects associated with rapid reduction in blood pressure (reduce infusion rate): headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort; occasionally reduced platelet count, acute transient phlebitis

Cyanide Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see p. 39)

Dose
  • Hypertensive emergencies, by intravenous infusion, initially 0.5–1.5 micrograms/kg/minute, then increased in steps of 500 nanograms/kg/minute every 5 minutes within range 0.5–8 micrograms/kg/minute (lower doses if already receiving other anti-hypertensives); stop if response unsatisfactory with max. dose in 10 minutes
  • Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure, 20–400 micrograms/minute (lower doses for patients being treated with other antihypertensives)

Methyldopa

Methyldopa is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy. Side-effects are minimised if the daily dose is kept below 1 g.

Clonidine has the disadvantage that sudden withdrawal of treatment may cause severe rebound hypertension.

Moxonidine, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.
### CLONIDINE HYDROCHLORIDE

**Indications**  
Hypertension; migraine (section 4.7.4.2); menopausal flushing (section 6.4.1.1)

**Cautions**  
Must be withdrawn gradually to avoid severe rebound hypertension; Raynaud’s syndrome or other occlusive peripheral vascular disease; history of depression; interactions: Appendix 1 (clonidine)

**Driving**  
Drowsiness may affect performance of skilled tasks (e.g., driving); effects of alcohol may be enhanced

**Pregnancy**  
May lower fetal heart rate, but risk should be balanced against risk of uncontrolled maternal hypertension; avoid intravenous injection

**Breast-feeding**  
Manufacturer advises avoid—present in milk

**Side-effects**  
Dry mouth, sedation, depression, fluid retention, bradycardia, Raynaud’s phenomenon, headache, dizziness, euphoria, nocturnal unrest, rash, nausea, constipation, rarely impotence

**Dose**  
- By mouth, 50–100 micrograms 3 times daily, increased every second or third day; usual max. dose 1.2 mg daily

**Catapres® (Boehringer Ingelheim)**  
Tablets, scored, clonidine hydrochloride 100 micrograms, net price 100-tab pack = £5.32; 300 micrograms, 100-tab pack = £12.39. Label: 3, 8

**Dixart® **  
Section 4.7.4.2

### METHYLDOPA

**Indications**  
Hypertension

**Cautions**  
Monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs; history of depression; positive direct Coombs’ test in up to 20% of patients (may affect blood cross-matching); interference with laboratory tests; interactions: Appendix 1 (methyldopa)

**Driving**  
Drowsiness may affect performance of skilled tasks (e.g., driving); effects of alcohol may be enhanced

**Contra-indications**  
Depression, phaeochromocytoma; acute porphyria (section 9.8.2)

**Hepatic impairment**  
Manufacturer advises caution in hepatic function tests; avoid in active liver disease

**Renal impairment**  
Start with small dose; increased sensitivity to hypotensive and sedative effect

**Pregnancy**  
Not known to be harmful

**Breast-feeding**  
Amount too small to be harmful

**Side-effects**  
Gastro-intestinal disturbances, dry mouth, stomatitis, sialadenitis; bradycardia, exacerbation of angina, postural hypotension, oedema; sedation, headache, dizziness, asthenia, myalgia, arthralgia, paraesthesia, nightmares, mild psychosis, depression, impaired mental acuity; Parkinsonism, Bell’s palsy; hepatitis, jaundice; pancreatitis; haemolytic anaemia; bone-marrow depression, leucopenia, thrombocytopenia, eosinophilia; hypersensitivity reactions including lupus erythematosus-like syndrome, drug fever, myocarditis, pericarditis; rashes (including toxic epidermal necrolysis); nasal congestion, failure of ejaculation, impotence, decreased libido, gynaecomastia, hyperprolactinaemia, amenorrhoea

**Dose**  
- Initially 250 mg 2–3 times daily, increased gradually at intervals of at least 2 days, max. 3 g daily; Elderly initially 125 mg twice daily, increased gradually, max. 2 g daily

**Methyldopa (Non-proprietary) Tablets**  
Coated, methyldopa (anhydrous) 125 mg, net price 56-tab pack = £16.29; 250 mg, 56-tab pack = £8.26; 500 mg, 56-tab pack = £11.49. Label: 3, 8

**Aldomet® (Rofok) Tablets**  
All yellow, f/c, methyldopa (anhydrous) 250 mg, net price 60 = £6.15; 500 mg, 30 = £4.55. Label: 3, 8

### MOXONIDINE

**Indications**  
Mild to moderate essential hypertension

**Cautions**  
Avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days); severe coronary artery disease; unstable angina; first-degree AV block; moderate heart failure; interactions: see Appendix 1 (moxonidine)

**Contra-indications**  
Conduction disorders (sick sinus syndrome, sino-atrial block, second- or third-degree AV block); bradycardia; severe heart failure

**Renal impairment**  
Max. single dose 200 micrograms and max. daily dose 400 micrograms if eGFR 30–60 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**  
Manufacturer advises avoid—no information available

**Breast-feeding**  
Present in milk—manufacturer advises avoid

**Side-effects**  
Dry mouth, diarrhoea, nausea, vomiting, headache, dizziness, euphoria, nocturnal unrest, rash, retention, bradycardia, Raynaud’s phenomenon, interference with laboratory tests; interactions: Appendix 1 (moxonidine)

**Moxonidine (Non-proprietary) Tablets**  
f/c, moxonidine 200 micrograms, net price 28-tab pack = £3.76; 300 micrograms, net price 28-tab pack = £4.82; 400 micrograms, net price 28-tab pack = £5.01. Label: 3

**Physiotens® (Solvay) Tablets**  
f/c, moxonidine 200 micrograms (pink), net price 28-tab pack = £9.72; 300 micrograms (red), 28-tab pack = £11.49; 400 micrograms (red), 28-tab pack = £13.26. Label: 3

### 2.5.3 Adrenergic neurone blocking drugs

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.
2 Cardiovascular system

Guanethidine, which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure, however alternative treatments are preferred (see section 2.5).

**GUANETHIDINE MONOSULPHATE**

**Indications** hypertensive crisis (but no longer recommended—see section 2.5)

**Cautions** coronary or cerebral arteriosclerosis, asthma, history of peptic ulceration; **interactions:** Appendix 1 (adrenergic neurone blockers)

**Contra-indications** phaeochromocytoma, heart failure

**Renal impairment** reduce dose if eGFR 40–65 mL/minute/1.73 m²; avoid if eGFR less than 40 mL/minute/1.73 m²

**Pregnancy** postural hypotension and reduced utero-placental perfusion; should not be used to treat hypertension in pregnancy

**Side-effects** postural hypotension, failure of ejaculation, fluid retention, nasal congestion, headache, diarrhoea, drowsiness

**Dose**
- By intramuscular injection, 10–20 mg, repeated after 3–6 hours if required
- Ismelin® (Amdipharm) Injection, guanethidine monosulphate 10 mg/mL, net price 1-mL amp = £1.56

**2.5.4 Alpha-adrenoceptor blocking drugs**

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Doxazosin, indoramin, and terazosin have properties similar to those of prazosin. Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension (section 2.5).

**Prostatic hyperplasia** Alfuzosin, doxazosin, indoramin, prazosin, tamsulosin, and terazosin are indicated for benign prostatic hyperplasia (section 7.4.1).

**DOXAZOSIN**

**Indications** hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1)

**Cautions** care with initial dose (postural hypotension); pulmonary oedema due to aortic or mitral stenosis; cataract surgery (risk of intra-operative floppy iris syndrome); heart failure; **interactions:** Appendix 1 (alpha-blockers)

**Driving** May affect performance of skilled tasks e.g. driving

**Contra-indications** history of hypotension; monotherapy in overflow bladder or anuria

**Hepatic impairment** use with caution; manufacturer advises in severe impairment—no information available

**Pregnancy** no evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk

**Breast-feeding** accumulates in milk—manufacturer advises avoid

**Side-effects** see section 7.4.1; also dyspnoea, coughing, fatigue, vertigo, paraesthesia, sleep disturbance, anxiety, influenza-like symptoms; back pain, myalgia; less commonly weight changes, angina, myocardial infarction, hypoaesthesia, tremor, agitation, micturition disturbance, epistaxis, arthralgia, tinnitus, and gout; very rarely cholestasis, hepatitis, jaundice, bradycardia, arrhythmias, bronchospasm, hot flushes, gynaecomastia, abnormal ejaculation, leucopenia, thrombocytopenia, and alopecia

**Dose**
- Hypertension, 1 mg daily, increased after 1–2 weeks to 2 mg once daily, and thereafter to 4 mg once daily, if necessary; max. 16 mg daily

**Doxazosin** (Non-proprietary) 

**Tablets**
- Tablets, doxazosin (as mesilate) 1 mg, net price 28-tab pack = £9.39; 2 mg, 28-tab pack = £9.98; 4 mg, 28-tab pack = £11.39. Counselling, initial dose, driving

**Brands include** Doxadura®

**Cardura®** (Pfizer) 

**Tablets**
- Tablets, doxazosin (as mesilate) 1 mg, net price 28-tab pack = £10.56; 2 mg, 28-tab pack = £14.08. Counselling, initial dose, driving

**Modified-release**

**Doxazosin** (Non-proprietary) 

**Tablets**
- Tablets, m/r, doxazosin (as mesilate) 4 mg, net price 28-tab pack = £6.33. Label: 25, counselling, initial dose, driving

**Dose** hypertension, benign prostatic hyperplasia, 4 mg once daily, increased to 8 mg once daily after 4 weeks if necessary

**Brands include** Doxadura® XL, Rapores® XL, Slocinx® XL

**Cardura®** (Pfizer) 

**Tablets**
- Tablets, m/r, doxazosin (as mesilate) 4 mg, net price 28-tab pack = £5.70; 8 mg, 28-tab pack = £9.98. Label: 25, counselling, driving, initial dose

**Dose** hypertension, benign prostatic hyperplasia, 4 mg once daily, increased to 8 mg once daily after 4 weeks if necessary

**INDORAMIN**

**Indications** hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1)

**Cautions** avoid alcohol (enhances rate and extent of absorption); control incipient heart failure before initiating indoramin; elderly; Parkinson’s disease (extrapyramidal disorders reported); epilepsy (convulsions in animal studies); history of depression, cataract surgery (risk of intra-operative floppy iris syndrome); **interactions:** Appendix 1 (alpha-blockers)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

**Contra-indications** established heart failure

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** no evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk

**Breast-feeding** no information available

**Side-effects** see section 7.4.1; also sedation; less commonly fatigue, weight gain, failure of ejaculation;
Phaeochromocytoma

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker (section 2.4); a cardioselective beta-blocker is preferred.

Phenoxybenzamine, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. Phentolamine is a short-acting alpha-blocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

Metiozine (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of phaeochromocytoma, and long term in patients unsuitable for surgery; an

Also reported extrapyramidal disorders, urinary frequency, and incontinence

**Dose**

- Hypertension, initially 25 mg twice daily, increased by 25–50 mg daily at intervals of 2 weeks; max. daily dose 200 mg in 2–3 divided doses
- Raynaud’s syndrome (but efficacy not established; see section 2.6.4); benign prostatic hyperplasia (section 7.4.1)
- Congestive heart failure (but see section 2.5.5; see also section 2.6.4); benign prostatic hyperplasia (section 7.4.1)
- Hypertension (see notes above), 500 micrograms 2–3 times daily followed by 1 mg at bedtime (compliance with long-term treatment important)
- Renal impairment initially 500 micrograms daily in moderate to severe impairment; increased with caution
- Pregnancy no evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk
- Breast-feeding no information available

**PRAZOSIN**

**Indications** hypertension (see notes above); congestive heart failure (but see section 2.5.5); Raynaud’s syndrome (see also section 2.6.4); benign prostatic hyperplasia (section 7.4.1)

**Cautions** first dose may cause collapse due to hypotension (therefore should be taken on retiring to bed); elderly; cataract surgery (risk of intra-operative floppy iris syndrome); interactions: Appendix 1 (alpha-blockers)

**Driving** May affect performance of skilled tasks e.g. driving

**Contra-indications** not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

**Hepatic impairment** initially 500 micrograms daily; increased with caution

**Renal impairment** initially 500 micrograms daily in moderate to severe impairment; increased with caution

**Pregnancy** no evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk

**Breast-feeding** amount probably too small to be harmful

**Side-effects** see section 7.4.1; also drowsiness; nervousness; urinary frequency; less commonly insomnia, paraesthesia, sweating, arthritis, eye disorders, tinnitus, and epistaxis; rarely pancreatitis, flushing, vasculitis, bradycardia, hallucinations, worsening of hyperplasia (section 7.4.1)

**Dose**

- Hypertension (see notes above), 500 micrograms 2–3 times daily for 3–7 days, the initial dose on retiring to bed (to avoid collapse, see Cautions); increased to 1 mg 2–3 times daily for a further 3–7 days; further increased if necessary to max. 20 mg daily in divided doses
- Congestive heart failure (but see section 2.5.5), 500 micrograms 2–4 times daily for 3–7 days, the initial dose on retiring to bed (to avoid collapse, see Cautions); increased to 1 mg 2–3 times daily for a further 3–7 days; further increased if necessary to max. 20 mg daily in divided doses
- Raynaud’s syndrome (but efficacy not established, see section 2.6.4), initially 500 micrograms twice daily (initial dose at bedtime, see above) increased, if necessary, after 3–7 days to usual maintenance 1–2 mg twice daily

**Prazosin** (Non-proprietary)

**Pharmaceuticals** Tablets, prazosin (as hydrochloride) 500 micrograms, net price 60-tab pack = £2.51; 1 mg, 60-tab pack = £3.23; 2 mg, 56-tab pack = £4.39; 5 mg, 56-tab pack = £8.75. Counselling, initial dose, driving

**HYPOVASE®** (Pfizer)

**Pharmaceuticals** Tablets, prazosin (as hydrochloride) 500 micrograms, net price 60-tab pack = £2.69; 1 mg, scored, 60-tab pack = £3.46. Counselling, initial dose, driving

**TARAZOSIN**

**Indications** mild to moderate hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1)

**Cautions** first dose may cause collapse due to hypotension (within 30–90 minutes, therefore should be taken on retiring to bed) (may also occur with rapid dose increase); cataract surgery (risk of intra-operative floppy iris syndrome); interactions: Appendix 1 (alpha-blockers)

**Driving** May affect performance of skilled tasks e.g. driving

**Pregnancy** no evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk

**Breast-feeding** no information available

**Side-effects** see section 7.4.1; also reported weight gain, drowsiness, parasthesia, nervousness, decreased libido, thrombocytopenia, back pain, and pain in extremities

**Dose**

- Hypertension, 1 mg at bedtime (compliance with bedtime dose important, see Cautions); dose doubled after 7 days if necessary; usual maintenance dose 2–10 mg once daily; more than 20 mg daily rarely improves efficacy
- Terazosin (Non-proprietary)

**Pharmaceuticals** Tablets, terazosin (as hydrochloride) 2 mg, net price 28-tab pack = £2.16; 5 mg, 28-tab pack = £2.58; 10 mg, 28-tab pack = £7.88. Counselling, initial dose, driving

**Hytrin®** (Amdipharm)

**Pharmaceuticals** Tablets, terazosin (as hydrochloride) 2 mg (yellow), net price 28-tab pack = £2.29; 5 mg (tan), 28-tab pack = £4.29; 10 mg (blue), 28-tab pack = £8.57; starter pack (for hypertension) of 7 × 1-mg tabs with 21 × 2-mg tabs = £13.00. Counselling, initial dose, driving

**Phaeochromocytoma**

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker (section 2.4); a cardioselective beta-blocker is preferred.

Phenoxybenzamine, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. Phentolamine is a short-acting alpha-blocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

Metiozine (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of phaeochromocytoma, and long term in patients unsuitable for surgery; an
alpha-adrenoceptor blocking drug may also be required. Metrosine should not be used to treat essential hypertension.

**PHENOXYBENZAMINE HYDROCHLORIDE**

**Indications** hypertensive episodes in phaeochromocytoma

**Cautions** elderly; congestive heart failure; severe inchaemic heart disease; concurrent use of other alpha-blocking agents; increased risk of hypotension; heart failure; cerebral vascular accident; monitor blood pressure regularly during infusion; carcinogenic in animals; avoid in acute porphyria (section 9.8.2); avoid extravasation (irritant to tissues)

**Contra-indications** history of cerebrovascular accident; during recovery period after myocardial infarction (usually 3–4 weeks); avoid infusion in hypovolaemia

**Renal impairment** use with caution

**Pregnancy** hypotension may occur in newborn

**Breast-feeding** may be present in milk

**Side-effects** postural hypotension with dizziness and marked compensatory tachycardia, lassitude, nasal congestion, miosis, inhibition of ejaculation; rarely gastro-intestinal disturbances; decreased sweating and dry mouth after intravenous infusion; idiosyncratic profound hypotension within few minutes of starting infusion; convulsions following rapid intravenous infusion also reported

**Dose**

- See under preparations

**Phenoxybenzamine (Goldshield)**

- **Injection concentrate**, phenoxybenzamine hydrochloride 50 mg/mL. To be diluted before use, net price 2-mL amp = £57.14 (hosp. only)

- **Dose** by intravenous infusion (preferably through large vein), adjacent in severe shock (but rarely used) and phaeochromocytoma, 1 mg/kg/daily over at least 2 hours; do not repeat within 24 hours (intensive care facilities needed)

- **Caution** Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands

**Dibenylene® (Alliance)**

- **Capsules**, red/white, phenoxybenzamine hydrochloride 10 mg, net price 30-cap pack = £10.84

- **Dose** phaeochromocytoma, 10 mg daily, increased by 10 mg daily; usual dose 1–2 mg/kg daily in 2 divided doses

**PHENTOLAMINE MESILATE**

**Indications** hypertensive episodes due to phaeochromocytoma e.g. during surgery; diagnosis of phaeochromocytoma (but see notes above)

**Cautions** monitor blood pressure (avoid in hypertension), heart rate; gastritis, peptic ulcer; elderly; interactions: Appendix 1 (alpha-blockers)

**Contra-indications** hypotension; history of myocardial infarction; coronary insufficiency, angina, or other evidence of coronary artery disease

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** use with caution—may cause marked decrease in maternal blood pressure with resulting fetal anoxia

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** postural hypotension, tachycardia, dizziness, flushing; nausea and vomiting, diarrhoea, nasal congestion; also acute or prolonged hypotension, angina, chest pain, arrhythmias

**Dose**

- Hypertensive episodes, by intravenous injection, 2–5 mg repeated if necessary

- Diagnosis of phaeochromocytoma, consult product literature

**Rogitine® (Alliance)**

- **Injection**, phentolamine mesilate 10 mg/mL, net price 1-mL amp = £1.53

- Excipients include sulphites

**2.5.5 Drugs affecting the renin-angiotensin system**

**2.5.5.1 Angiotensin-converting enzyme inhibitors**

**2.5.5.2 Angiotensin-II receptor antagonists**

**2.5.5.3 Renin inhibitors**

**Heart failure**

Drug treatment of heart failure associated with a reduced left ventricular ejection fraction (left ventricular systolic dysfunction) is covered below; optimal management of heart failure with a preserved left ventricular ejection fraction has not been established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An ACE inhibitor, titrated to a ‘target dose’ (or the maximum tolerated dose if lower), together with a beta-blocker, form the basis of treatment for all patients with heart failure due to left ventricular systolic dysfunction. An ACE inhibitor (section 2.5.5.1) is generally advised for patients with asymptomatic left ventricular systolic dysfunction or symptomatic heart failure. An angiotensin-II receptor antagonist (section 2.5.5.2) may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit. Candesartan, an angiotensin-II receptor antagonist, can also be added to ACE inhibitor and beta-blocker therapy in patients with mild to moderate heart failure who continue to remain symptomatic.

The beta-blockers bisoprolol and carvedilol (section 2.4) are of value in any grade of stable heart failure due to left ventricular systolic dysfunction; nebivolol (section 2.4) is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

The aldosterone antagonist spironolactone (section 2.2.3) can be considered for patients with moderate to severe heart failure who are already taking an ACE inhibitor and a beta-blocker; low doses of spironolactone (usually 25 mg daily) reduce symptoms and mortality in these patients. If spironolactone cannot be
ACE inhibitors are used for the management of heart failure after an acute myocardial infarction with evidence of left ventricular systolic dysfunction. Close monitoring of serum creatinine, eGFR, and potassium is necessary, particularly following any change in treatment or any change in the patient’s clinical condition.

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contraindicated, may be given isosorbide dinitrate (section 2.6.1) with hydralazine (section 2.5.1), but this combination may be poorly tolerated. In patients of African or Caribbean origin, and those with moderate to severe heart failure, the combination of isosorbide dinitrate and hydralazine may be considered in addition to standard therapy with an ACE inhibitor and a beta-blocker, if necessary.

Digoxin (section 2.1.1) improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with worsening or severe heart failure due to left ventricular systolic dysfunction who remain symptomatic despite treatment with an ACE inhibitor and a beta-blocker in combination with either an aldosterone antagonist, candesartan, or isosorbide dinitrate with hydralazine.

Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A thiazide diuretic (section 2.2.1) may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (eGFR less than 30 mL/minute/1.73 m², see Renal Impairment, section 2.2.1) and a loop diuretic (section 2.2.2) is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone (section 2.2.1) may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

**2.5.5.1 Angiotensin-converting enzyme inhibitors**

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

**Heart failure** ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker (section 2.5.5). Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone may be beneficial in severe heart failure (section 2.5.5) and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide 80 mg daily or more). Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision, see below. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

**Hypertension** An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well (see section 2.5). ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy (see section 2.5.1). They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy (see Cautions, below); the first dose should preferably be given at bedtime.

**Diabetic nephropathy** For comment on the role of ACE inhibitors in the management of diabetic nephropathy, see section 6.1.5.

**Prophylaxis of cardiovascular events** ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction, see section 2.10.1. ACE inhibitors may also have a role in preventing cardiovascular events.

**Initiation under specialist supervision** ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- with hypovolaemia;
- with hyperkalaemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

**Renal effects** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced (see Renal Impairment below and under individual drugs). Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor. Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in
patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

**Caution**

ACE inhibitors need to be initiated with care in patients receiving diuretics (important: see Concomitant diuretics, below); first doses can cause hypertension especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure (see above). They should also be used with caution in peripheral vascular disease or generalised atherosclerosis owing to risk of clinically silent renovascular disease; for use in pre-existing renovascular disease, see Renal Effects above. The risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended). ACE inhibitors should be used with care in patients with severe or symptomatic aortic stenosis (risk of hypotension) and in hypertrophic cardiomyopathy. They should also be used with care (or avoided) in those with a history of idiopathic or hereditary angioedema. If jaundice or marked elevations of hepatic enzymes occur during treatment then the ACE inhibitor should be discontinued—risk of hepatic necrosis (see also Hepatic impairment, below). **Interactions:** Appendix 1 (ACE inhibitors).

**Anaphylactoid reactions** To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulphate; they should also be withheld before desensitisation with wasp or bee venom.

**Concomitant diuretics** ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor; for at least 2 hours or until the blood pressure has stabilised.

**Contraindications** ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).

**Hepatic impairment** Use of prodrugs such as cilazapril, enalapril, fosinopril, imidapril, moexipril, perindopril, quinapril, ramipril, andtrandolapril requires close monitoring in patients with impaired liver function.

**Renal impairment** ACE inhibitors should be used with caution and the response monitored (see Renal effects above); hyperkalaemia and other side effects more common; the dose may need to be reduced, see individual drugs.

**Pregnancy** ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.

**Side-effects** ACE inhibitors can cause profound hypotension (see Caution) and renal impairment (see Renal effects above), and a persistent dry cough. They can also cause angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients), rash (which may be associated with pruritus and urticaria), pancreatitis, and upper respiratory-tract symptoms such as sinusitis, rhinitis, and sore throat. Gastro-intestinal effects reported with ACE inhibitors include nausea, vomiting, dyspepsia, diarrhoea, constipation, and abdominal pain. Altered liver function tests, cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure have been reported—discontinue if marked elevation of hepatic enzymes or jaundice. Hyperkalaemia, hypoglycaemia, and blood disorders including thrombocytopenia, leucopenia, neutropenia, and haemolytic anaemia have also been reported. Other reported side effects include headache, dizziness, fatigue, malaise, taste disturbance, paraesthesia, bronchospasm, fever, soroitis, vasculitis, myalgia, arthralgia, positive antinuclear antibody, raised erythrocyte sedimentation rate, eosinophilia, leucocytosis, and photosensitivity.

**Combination products** Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

**CAPTOPRIL**

**Indications** Mild to moderate essential hypertension alone or with thiazide therapy and severe hypertension resistant to other treatment; congestive heart failure with left ventricular dysfunction (adjunct—see section 2.5.5); following myocardial infarction, see
Co-zidocapt (Non-proprietary)  
Capoten (Non-proprietary)  
Captopril  

Diabetic nephropathy, 75–100 mg daily in divided doses;
Prophylaxis after infarction in clinically stable patients.
Heart failure (adjunct), initially 6.25–12.5 mg 2–3 times daily under close medical supervision (see notes above), increased gradually at intervals of at least 2 weeks up to max. 150 mg daily in divided doses if tolerated.

Prophylaxis after infarction in clinically stable patients with asymptomatic or symptomatic left ventricular dysfunction (radionuclide ventriculography or echocardiography undertaken before initiation), initially 6.25 mg, starting as early as 3 days after infarction, then increased over several weeks to 150 mg daily (if tolerated) in divided doses.

Diabetic nephropathy, 75–100 mg daily in divided doses; if further blood pressure reduction required, other antihypertensives may be used in conjunction with captopril; in severe renal impairment, initially 12.5 mg twice daily (if concomitant diuretic therapy required, loop diuretic rather than thiazide should be chosen).

Captopril (Non-proprietary)  
Tablets, captopril 12.5 mg, net price 56-tab pack = £1.96; 50 mg, 56-tab pack = £1.96
Brands include Ecopace®, Kaplon®

Capoten® (Squibb)  
Tablets, captopril 25 mg, net price 28-tab pack = £5.26; 50 mg (scored), 56-tab pack = £17.96

With diuretic
Note For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on thiazides, see section 2.2.1

Co-zidocapt (Non-proprietary)  
Tablets, co-zidocapt 12.5/25 (hydrochlorothiazide 12.5 mg, captopril 25 mg), net price 28-tab pack = £14.10
Brands include Capto-co®

Tablets, co-zidocapt 25/50 (hydrochlorothiazide 25 mg, captopril 50 mg), net price 28-tab pack = £14.00
Brands include Capto-co®

Capozide® (Squibb)  
LS tablets, scored, co-zidocapt 12.5/25 (hydrochlorothiazide 12.5 mg, captopril 25 mg), net price 28-tab pack = £10.05
Tablets, scored, co-zidocapt 25/50 (hydrochlorothiazide 25 mg, captopril 50 mg), net price 28-tab pack = £7.02

CILAZAPRIL  
Indications essential hypertension; congestive heart failure (adjunct—see section 2.5.5)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above; max. dose 500 micrograms daily in liver cirrhosis; manufacturer advises avoid in asics
Renal impairment see notes above; max. initial dose 500 micrograms once daily (do not exceed 2.5 mg once daily) if eGFR 10–40 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²
Pregnancy see notes above
Breast-feeding see notes above

Side-effects see notes above; also less commonly dry mouth, decreased appetite, angina, tachycardia, palpitation, flushing, dyspnoea, impotence, excessive sweating; rarely glossitis, bronchitis, interstitial lung disease, gynaecomastia, peripheral neuropathy, Stevens-Johnson syndrome, toxic epidermal necrolysis

Hypertension, initially 1 mg once daily (reduced to 0.5 mg if eGFR less than 30 mL/minute/1.73 m² of 250 micrograms once daily if used in addition to diuretic (see notes above), or in cardiac decompensation, in severe hypertension, in volume depletion, in the elderly, or in renal impairment), then adjusted according to response; usual maintenance dose 2.5–5 mg once daily; max. 5 mg daily.

Heart failure (adjunct), initially 500 micrograms once daily under close medical supervision (see notes above), or in cardiac decompensation, in severe hypertension, in volume depletion, in the elderly, or in renal impairment), then adjusted according to response; usual maintenance dose 2.5–5 mg once daily; max. 5 mg once daily.

Vascace® (Roche)  
Tablets, f/c, cilazapril 500 micrograms (white), net price 30-tab pack = £3.68; 1 mg (yellow), 30-tab pack = £6.07; 2.5 mg (pink), 28-tab pack = £7.20; 5 mg (brown), 28-tab pack = £12.51

ENALAPRIL MALEATE  
Indications hypertension; symptomatic heart failure (adjunct—see section 2.5.5); prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above; max. initial dose 2.5 mg daily if eGFR less than 30 mL/minute/1.73 m²
Pregnancy see notes above
Breast-feeding see notes above

Side-effects see notes above; also dyspnoea; depression, asthenia; blurred vision; less commonly dry mouth, peptic ulcer, anorexia, ileus; arrhythmias, palpitation, flushing; confusion, nervousness, drowsiness, insomnia, vertigo; impotence; muscle cramps; tinnitus; alopecia, sweating; hyponatraemia; rarely...
stomatitis, glossitis, Raynaud’s syndrome, pulmonary infiltrates, allergic alveolitis, dream abnormalities, gynaecomastia, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, pemphigus; very rarely gastro-intestinal angioedema

Dose

- Hypertension, used alone, initially 5 mg once daily; if used in addition to diuretic (see notes above), or in renal impairment, lower initial doses may be required; usual maintenance dose 20 mg once daily; max. 40 mg once daily
- Heart failure (adjunct), asymptomatic left ventricular dysfunction, initially 2.5 mg once daily under close medical supervision (see notes above), increased gradually over 2–4 weeks to 10–20 mg twice daily if tolerated

Enalapril Maleate (Non-proprietary) (Trade)

Tablets, enalapril maleate 2.5 mg, net price 28-tab pack = £1.05; 5 mg, 28-tab pack = £9.60; 10 mg, 28-tab pack = £1.05; 20 mg, 28-tab pack = £1.24

Brands include: Ednyp®

Innovace® (MSD) (Trade)

Tablets, yellow, scored, enalapril maleate 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £12.82

Note: Non-proprietary tablets containing enalapril maleate (20 mg) and hydrochlorothiazide (12.5 mg) are available

With diuretic

Note: For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on thiazides, see section 2.2.1

Innozide® (MSD) (Trade)

Tablets, yellow, scored, enalapril maleate 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £12.82

Note: Non-proprietary tablets containing enalapril maleate (20 mg) and hydrochlorothiazide (12.5 mg) are available

FOSINOPRIL SODIUM

Indications: hypertension; congestive heart failure (adjunct—see section 2.5.5)

Cautions: see notes above

Contra-indications: see notes above

Hepatic impairment: see notes above

Renal impairment: see notes above

Pregnancy: see notes above

Breast-feeding: see notes above

Side-effects: see notes above; chest pain; musculoskeletal pain

Dose

- Hypertension, initially 10 mg daily, increased if necessary after 4 weeks; usual dose range 10–40 mg (doses over 40 mg not shown to increase efficacy); if used in addition to diuretic see notes above
- Heart failure (adjunct), initially 10 mg once daily under close medical supervision (see notes above), increased gradually to 40 mg once daily if tolerated

Fosinopril sodium (Non-proprietary) (Trade)

Tablets, fosinopril sodium 10 mg, net price 28-tab pack = £2.18; 20 mg, 28-tab pack = £2.53

IMIDAPRIL HYDROCHLORIDE

Indications: essential hypertension

Cautions: see notes above

Contra-indications: see notes above

Hepatic impairment: see notes above

Renal impairment: see notes above; initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy: see notes above

Breast-feeding: see notes above

Side-effects: see notes above; dry mouth, glossitis, ileus; bronchitis, dyspnoea; sleep disturbances, depression, confusion, blurred vision, tinnitus, impotence

Dose

- Initially 5 mg daily before food; if used in addition to diuretic (see notes above), in elderly, in patients with heart failure, angina or cerebrovascular disease, or in renal or hepatic impairment, initially 2.5 mg daily; if necessary increase dose at intervals of at least 3 weeks; usual maintenance dose 10 mg once daily; max. 20 mg daily (elderly, 10 mg daily)

Tanatril® (Chiesi) (Trade)

Tablets, scored, imidapril hydrochloride 5 mg, net price 28-tab pack = £6.40; 10 mg, 28-tab pack = £7.22; 20 mg, 28-tab pack = £8.67

Lisinopril

Indications: hypertension (but see notes above); symptomatic heart failure (adjunct—see section 2.5.5); short-term treatment following myocardial infarction in haemodynamically stable patients; renal complications of diabetes mellitus

Cautions: see notes above

Contra-indications: see notes above

Renal impairment: see notes above; max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m² (max. 40 mg daily); 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m² (max. 40 mg daily); 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m²

Pregnancy: see notes above

Breast-feeding: see notes above

Side-effects: see notes above; also less commonly tachycardia, palpitation, cerebrovascular accident, myocardial infarction, Raynaud’s syndrome, confusion, mood changes, vertigo, sleep disturbances, asthenia, impotence; rarely dry mouth, gynaecomastia, alopecia, psoriasis; very rarely allergic alveolitis, pulmonary infiltrates, profuse sweating, pemphigus, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

- Hypertension, initially 10 mg once daily; if used in addition to diuretic (see notes above) or in cardiac decompensation or in volume depletion, initially 2.5–5 mg once daily; usual maintenance dose 20 mg once daily; max. 80 mg once daily
- Heart failure (adjunct), initially 2.5 mg once daily under close medical supervision (see notes above); increased in steps no greater than 10 mg at intervals of at least 2 weeks up to max. 35 mg once daily if tolerated
- Prophylaxis after myocardial infarction, systolic blood pressure over 120 mmHg, 5 mg within 24 hours, followed by further 5 mg 24 hours later, then 10 mg after a further 24 hours, and continuing with 10 mg once daily for 6 weeks (or continued if heart failure), sys-
tolic blood pressure 100–120 mmHg, initially 2.5 mg once daily, increased to maintenance dose of 5 mg once daily

**Note** Should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg; temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

- Renal complications of diabetes mellitus, initially 2.5–5 mg once daily adjusted according to response; usual dose range 10–20 mg once daily

**Lisinopril** (Non-proprietary) Tablets, lisinopril (as dihydrate) 2.5 mg, net price 28-tab pack = £87p; 5 mg, 28-tab pack = £93p; 10 mg, 28-tab pack = £1.01; 20 mg, 28-tab pack = £1.19

**Zestril** (AstraZeneca) Tablets, lisinopril (as dihydrate) 2.5 mg, net price 28-tab pack = £1.19; 5 mg (pink), 28-tab pack = £1.31; 10 mg (pink), 28-tab pack = £2.05; 20 mg (pink), 28-tab pack = £2.17

**With diuretic**

**Note** For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on thiazides, see section 2.2.1

**Carace Plus** (MSD) Tablets, carace plus tablets, blue, lisinopril 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £10.10

**Carace 20 Plus tablets** yellow, scored, lisinopril 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.43

**Lisicostad** (Genus) Tablets, lisicostad 10/12.5 mg tablets, scored, lisinopril (as dihydrate) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £10.99

**Lisicostad 20/12.5 mg tablets** scored, lisinopril (as dihydrate) 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.99

**Zestoretic** (AstraZeneca) Tablets, zestoretic tablets, peach, lisinopril (as dihydrate) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £2.27

**Zestoretic 20 tablets** lisinopril (as dihydrate) 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £3.84

**MOEXIPRIL HYDROCHLORIDE**

**Indications** essential hypertension

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above; if eGFR less than 40 mL/minute/1.73 m², initial dose 3.75 mg once daily titrated to max. 15 mg once daily

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; arrhythmias, angina, chest pain, syncope, cerebrovascular accident, myocardial infarction; appetite and weight changes; dry mouth, photosensitivity, flushing, nervousness, mood changes, anxiety, drowsiness, sleep disturbance, tin-

**nitus, influenza-like syndrome, sweating and dyspnoea**

**Dose**

- Monotherapy, initially 7.5 mg once daily; if used in addition to diuretic (see notes above), with nifedipine, or in elderly, initially 3.75 mg once daily; usual range 7.5–30 mg once daily; doses above 30 mg daily not shown to increase efficacy

**Perdix** (UCB Pharma) Tablets, f/c, pink, scored, moexipril hydrochloride 7.5 mg, net price 28-tab pack = £6.04; 15 mg, 28-tab pack = £6.96

**PERINDOPRIL ERBUMINE**

**Indications** hypertension (but see notes above); symptomatic heart failure (adjunct—see section 2.5.5); prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above; max. initial dose 2 mg once daily if eGFR 30–60 mL/minute/1.73 m²; 2 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also asthenia, mood and sleep disturbances

**Dose**

- Hypertension, initially 4 mg once daily in the morning for 1 month, subsequently adjusted according to response; if used in addition to diuretic (see notes above), in elderly, in renal impairment, in cardiac decompensation, or in volume depletion, initially 2 mg once daily; max. 8 mg daily

- Heart failure (adjunct), initially 2 mg once daily in the morning under close medical supervision (see notes above), increased after at least 2 weeks to max. 4 mg once daily if tolerated

- Following myocardial infarction or revascularisation, initially 4 mg once daily in the morning increased after 2 weeks to 8 mg once daily if tolerated; elderly 2 mg once daily for 1 week, then 4 mg once daily for 1 week, thereafter increased to 8 mg once daily if tolerated

**Perindopril** (Non-proprietary) Tablets, perindopril erbumine (= tert-butylamine) 2 mg, net price 30-tab pack = £1.72; 4 mg, 30-tab pack = £1.81; 8 mg, 30-tab pack = £1.94. Label: 22

**PERINDOPRIL ARGININE**

**Indications** see under Perindopril Erbumine and notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above; max. initial dose 2.5 mg once daily if eGFR 30–60 mL/minute/1.73 m²; 2.5 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** see notes above
**Side-effects** see under Perindopril Erbumine and notes above

**Dose**
- Hypertension, initially 5 mg once daily in the morning for 1 month, subsequently adjusted according to response; if used in addition to diuretic (see notes above), in elderly, in renal impairment, in cardiac decompensation, or in volume depletion, initially 2.5 mg once daily; max. 10 mg daily
- Heart failure (adjunct), initially 2.5 mg once daily in the morning under close medical supervision (see notes above), increased after 2 weeks to max. 5 mg once daily if tolerated
- Following myocardial infarction or revascularisation, initially 5 mg once daily in the morning increased after 2 weeks to 10 mg once daily if tolerated; elderly, 2.5 mg once daily for 1 week, then 5 mg once daily for 1 week, thereafter increased to 10 mg once daily if tolerated

**Conversyl® Arginine** (Servier)

*Tablets, f/c, perindopril arginine 2.5 mg (white), net price 30-tab pack = £8.27; 5 mg (light green, scored), 30-tab pack = £9.36; 10 mg (green), 30-tab pack = £11.02. Label: 22

**Perindopril arginine with diuretic**

*Note* For hypertension not adequately controlled by perindopril alone. For prescribing information on indapamide, see section 2.2.1

**Conversyl® Arginine Plus** (Servier)

*Tablets, f/c, perindopril arginine 5 mg, indapamide 1.25 mg, net price 30-tab pack = £12.65. Label: 22

**QUINAPRIL**

**Indications** essential hypertension; congestive heart failure (adjunct—see section 2.5.5)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above; max. initial dose 2.5 mg once daily if eGFR less than 40 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; asthenia, chest pain, oedema, flatulence, nervousness, depression, insomnia, blurred vision, impotence, and back pain

**Dose**
- Hypertension, initially 10 mg once daily; with a diuretic (see notes above), in elderly, or in renal impairment initially 2.5 mg daily; usual maintenance dose 20–40 mg daily in single or 2 divided doses; up to 80 mg daily has been given
- Heart failure (adjunct), initial dose 2.5 mg daily under close medical supervision (see notes above), increased gradually at intervals of 1–2 weeks to max. 10 mg daily if tolerated; max. 40 mg daily

**Quinapril (Non-proprietary)**

*Tablets, quinapril (as hydrochloride) 5 mg, net price 28-tab pack = £2.05; 10 mg, net price 28-tab pack = £2.39; 40 mg, 28-tab pack = £8.81

*Brands include: Quinapril®*

**Accupro® (Pfizer)**

*Tablets, f/c, quinapril (as hydrochloride) 5 mg (brown), net price 28-tab pack = £8.60; 10 mg (brown), 28-tab pack = £8.60; 20 mg (brown), 28-tab pack = £10.79; 40 mg (red-brown), 28-tab pack = £9.75

**With diuretic**

*Note* For hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on thiazides, see section 2.2.1

**Accuretic® (Pfizer)**

*Tablets, pink, f/c, scored, quinapril (as hydrochloride) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.75

**RAMIPRIL**

**Indications** hypertension; symptomatic heart failure (adjunct—see section 2.5.5); following myocardial infarction in patients with clinical evidence of heart failure; prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or with diabetes mellitus and at least one additional risk factor for cardiovascular disease; nephropathy (consult product literature)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** max. daily dose 2.5 mg; see also notes above

**Renal impairment** see notes above; max. daily dose 5 mg if eGFR 30–60 mL/minute/1.73 m²; max. initial dose 1.25 mg once daily (do not exceed 5 mg once daily) if eGFR 10–30 mL/minute/1.73 m²; max. initial dose 1.25 mg once daily (do not exceed 2.5 mg once daily) if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; arrhythmias, angina, chest pain, syncope, cerebrovascular accident, myocardial infarction, loss of appetite, stomatitis, dry mouth, skin reactions including erythema multiforme and pemphigoid exanthema; precipitation or exacerbation of Raynaud’s syndrome; conjunctivitis, onycholyisis, confusion, nervousness, depression, anxiety, impotence, decreased libido, alopecia, bronchitis and muscle cramps

**Dose**
- Hypertension, initially 1.25–2.5 mg once daily, increased at intervals of 2–4 weeks to max. 10 mg once daily; if used in addition to diuretic see notes above
- Heart failure (adjunct), initially 1.25 mg once daily under close medical supervision (see notes above), increased gradually at intervals of 1–2 weeks to max. 10 mg daily if tolerated (preferably taken in 2 divided doses)
- Prophylaxis after myocardial infarction (started at least 48 hours after infarction), initially 2.5 mg twice daily, increased after 3 days to 5 mg twice daily

**Note** If initial 2.5 mg dose not tolerated, give 1.25 mg twice daily for 2 days before increasing to 2.5 mg twice daily, then 5 mg twice daily; withdraw if dose cannot be increased to 2.5 mg twice daily

- Prophylaxis of cardiovascular events, initially 2.5 mg once daily, increased after 1–2 weeks to 5 mg once daily; then increased after a further 2–3 weeks to 10 mg once daily
2.5.5 Drugs affecting the renin-angiotensin system

- Nephropathy, initially 1.25 mg once daily, increased after 2 weeks to 2.5 mg once daily, then increased after a further 2 weeks to 5 mg once daily if tolerated

Ramipril (Non-proprietary) (£19.43)

Capsules, ramipril 1.25 mg, net price 28-cap pack = £1.10; 2.5 mg, 28-cap pack = £1.18; 5 mg, 28-cap pack = £1.25; 10 mg, 28-cap pack = £1.41

Tablets, ramipril 1.25 mg, net price 28-tab pack = £1.71; 2.5 mg, 28-tab pack = £1.42; 5 mg, 28-tab pack = £1.66; 10 mg, 28-tab pack = £1.89

Tritace® (Sanofi-Aventis) (£11.07)

Tablets, scored, ramipril 1.25 mg (white), net price 28-tab pack = £5.09; 2.5 mg (yellow), 28-tab pack = £7.22; 5 mg (red), 28-tab pack = £10.05; 10 mg (white), 28-tab pack = £13.68

Tiratric® tablets, 35-day starter pack of ramipril 7 × 2.5 mg with 21 × 5 mg and 7 × 10 mg, net price = £13.00

With calcium-channel blocker

Note For hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on felodipine, see section 2.6.2

Triapin® (Sanofi-Aventis) (£24.55)

Capsules, trandolapril 1.25 mg, net price 28-cap pack = £1.49; 1 mg, 28-cap pack = £7.23; 2 mg, 28-cap pack = £3.75; 4 mg, 28-cap pack = £12.31

Gopten® (Abbott) (£24.55)

Capsules, trandolapril 500 micrograms (red/yellow), net price 14-cap pack = £1.19; 1 mg (red/orange), 28-cap pack = £3.81; 2 mg (red/red), 28-cap pack = £5.81; 4 mg (red/maroon), 28-cap pack = £9.86

With calcium-channel blocker

Note For hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on verapamil, see section 2.6.2

Tarka® (Abbott) (£24.55)

Capsules, pink, trandolapril 2 mg, verapamil hydrochloride 180 mg (m/r), net price 28 cap-pack = £10.29. Label: 25

2.5.5.2 Angiotensin-II receptor antagonists

Candesartan, eprosartan, irbesartan, losartan, olmesartan, telmisartan, and valsartan are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure (section 2.5.5) or diabetic nephropathy (section 6.1.5).

Cautions Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal Effects under ACE Inhibitors, section 2.5.5.1). Monitoring of plasma-potassium concentration is advised, particularly in the elderly and in patients with renal impairment; lower initial doses may be appropriate in these patients. Angiotensin-II receptor antagonists should be used with caution in aortic or mitral valve stenosis and in hypertrophic cardiomyopathy. Those with primary aldosteronism, and Afro-Caribbean patients (particularly those with left ventricular hypertrophy), may not benefit from an angiotensin-II receptor antagonist. Interactions: Appendix 1 (angiotensin-II receptor antagonists).

Pregnancy Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.

Breast-feeding Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

Side-effects Side-effects are usually mild. Symptomatic hypotension including dizziness may occur, particularly in patients with intravascular volume depletion

TRANDOLAPRIL

Indications mild to moderate hypertension; following myocardial infarction in patients with left ventricular dysfunction

Cautions see notes above

Contra-indications see notes above

Renal impairment see notes above; max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Dose

- Hypertension, initially 500 micrograms once daily, increased at intervals of 2–4 weeks; usual range 1–2 mg once daily; max. 4 mg daily; if used in addition to diuretics see notes above

- Prophylaxis after myocardial infarction (starting as early as 3 days after infarction), initially 500 micrograms once daily; gradually increased to max. 4 mg once daily

Note If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril

Trandolapril (Non-proprietary) (£24.55)

Capsules, trandolapril 500 micrograms, net price 14-cap pack = £1.49; 1 mg, 28-cap pack = £7.23; 2 mg, 28-cap pack = £3.75; 4 mg, 28-cap pack = £12.31

Gopten® (Abbott) (£24.55)

Capsules, trandolapril 500 micrograms (red/yellow), net price 14-cap pack = £1.19; 1 mg (red/orange), 28-cap pack = £3.81; 2 mg (red/red), 28-cap pack = £5.81; 4 mg (red/maroon), 28-cap pack = £9.86

Angiotensin-II receptor antagonists

Candesartan, eprosartan, irbesartan, losartan, olmesartan, telmisartan, and valsartan are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure (section 2.5.5) or diabetic nephropathy (section 6.1.5).

Cautions Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal Effects under ACE Inhibitors, section 2.5.5.1). Monitoring of plasma-potassium concentration is advised, particularly in the elderly and in patients with renal impairment; lower initial doses may be appropriate in these patients. Angiotensin-II receptor antagonists should be used with caution in aortic or mitral valve stenosis and in hypertrophic cardiomyopathy. Those with primary aldosteronism, and Afro-Caribbean patients (particularly those with left ventricular hypertrophy), may not benefit from an angiotensin-II receptor antagonist. Interactions: Appendix 1 (angiotensin-II receptor antagonists).

Pregnancy Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.

Breast-feeding Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

Side-effects Side-effects are usually mild. Symptomatic hypotension including dizziness may occur, particularly in patients with intravascular volume depletion
2.5.5 Drugs affecting the renin-angiotensin system

EPROSARTAN

Indications hypertension (see also notes above)

Cautions see notes above

Hepatic impairment half dose in severe liver disease

Renal impairment initial dose if eGFR less than 60 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also flatulence, hypertriglyceridaemia, arthralgia, rhinitis; rarely headache, asthenia, anaemia, hypersensitivity reactions (including rash, pruritus, urticaria); very rarely anaphylaxis, angioedema

Dose

600 mg once daily (elderly over 75 years, moderate hepatic impairment, renal impairment, initially 300 mg once daily); if necessary increased after 2–3 weeks to 800 mg once daily

Teveten® (Solvay) Tablets, f/c, eprosartan (as mesilate) 300 mg (white), net price 28-tab pack = £7.31; 400 mg (pink), 56-tab pack = £15.77; 600 mg (white), 28-tab pack = £14.31. Label: 21

IRBESARTAN

Indications hypertension; renal disease in hypertensive type 2 diabetes mellitus (see also notes above)

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also nausea, vomiting; fatigue; musculoskeletal pain; less commonly diarrhoea, dyspepsia, flushing, tachycardia, chest pain, cough, and sexual dysfunction; rarely rash, urticaria; very rarely headache, myalgia, arthralgia, tinnitus, taste disturbance, hepatitis, renal dysfunction, and cutaneous vasculitis

Dose

Hypertension, initially 150 mg once daily, increased if necessary to 300 mg once daily (in haemodialysis or in ELDERLY over 75 years, initial dose of 75 mg once daily may be used); CHILD not recommended

Renal disease in hypertensive type 2 diabetes mellitus, initially 150 mg once daily, increased to 300 mg once daily if tolerated (in haemodialysis or in ELDERLY over 75 years, consider initial dose of 75 mg once daily); CHILD not recommended

Aprovel® (Bristol-Myers Squibb, Sanofi-Aventis) Tablets, f/c, irbesartan 75 mg, net price 28-tab pack = £9.69; 150 mg, 28-tab pack = £11.84; 300 mg, 28-tab pack = £15.93

With diuretic

Note For hypertension not adequately controlled with irbesartan alone. For prescribing information on thiazides, see section 2.2.1

CoAprovel® (Bristol-Myers Squibb, Sanofi-Aventis) Tablets, f/c, irbesartan 150 mg, hydrochlorothiazide 12.5 mg (peach), net price 28-tab pack = £11.84; irbesartan 300 mg, hydrochlorothiazide 12.5 mg (peach), 28-tab pack = £15.93; irbesartan 300 mg, hydrochlorothiazide 25 mg (pink), 28-tab pack = £15.93

LOSARTAN POTASSIUM

Indications hypertension (including reduction of stroke risk in hypertension with left ventricular hypertrophy); chronic heart failure when ACE inhibitors are unsuitable or contra-indicated; diabetic nephropathy in type 2 diabetes mellitus (see also notes above)

Cautions see notes above; severe heart failure

Hepatic impairment consider dose reduction in mild to moderate impairment; manufacturer advises avoid in severe impairment—no information available

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; asthenia, fatigue, vertigo; less commonly gastro-intestinal disturbances, angina, palpitation, oedema, dyspnoea, headache, sleep disorders, urticaria, pruritus, rash; rarely hepatitis, atrial fibrillation, cerebrovascular accident, syncope, paraesthesia; also reported pancreatitis, anaphylaxis, cough, depression, erectile dysfunction, anaemia, thrombocytopenia, hyponatraemia, arthralgia, myalgia, rhabdomyolysis, tinnitus, photosensitivity, and vasculitis (including Henoch-Schönlein purpura)

Dose

Hypertension, diabetic nephropathy in type 2 diabetes mellitus, usually 50 mg once daily (intravenous volume depletion, initially 25 mg once daily); if
chronic heart failure, 12.5 mg once daily, increased at weekly intervals to 50 mg once daily if tolerated.

**Losartan Potassium** (Non-proprietary)

**Tablets**, losartan potassium 12.5 mg, net price 28-tab pack = £7.70; 25 mg, 28-tab pack = £2.64; 50 mg, 28-tab pack = £2.58; 100 mg, 28-tab pack = £2.64.

**Cozaar** (MSD)

**Tablets**, f/c, losartan potassium 12.5 mg (blue), net price 28-tab pack = £8.09; 25 mg (white), net price 28-tab pack = £16.18; 50 mg (white, scored), 28-tab pack = £12.80; 100 mg (white), 28-tab pack = £16.18.

**Oral suspension**, losartan potassium 12.5 mg/5 mL when reconstituted with solvent provided, net price 200-mL (berry-citrus flavour) = £53.68.

**With diuretic**

**Note** For hypertension not adequately controlled with losartan alone. For prescribing information on thiazides, see section 2.2.1.

**Cozaar-Comp** (MSD)

**Tablets**, 50/12.5, yellow, f/c, losartan potassium 50 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £12.80.

**Tablets**, 100/12.5, white, f/c, losartan potassium 100 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £16.18.

**Tablets**, 100/25, yellow, f/c, losartan potassium 100 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £16.18.

**OLMESARTAN MEDOXOMIL**

**Indications** hypertension (see also notes above)

**Cautions** see notes above

**Contra-indications** biliary obstruction

**Hepatic impairment** dose should not exceed 20 mg daily in moderate impairment; manufacturer advises avoid in severe impairment—no information available

**Renal impairment** max. 20 mg daily if eGFR 20–60 mL/minute/1.73 m²; avoid if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also gastrointestinal disturbances; chest pain, peripheral oedema, hypertriglyceridaemia; fatigue; influenza-like symptoms, cough, pharyngitis, rhinitis; urinary-tract infection; haematuria, hyperuricaemia; arthritis; musculoskeletal pain; less commonly angina, vertigo, rash; very rarely headache, thrombocytopenia, myalgia, pruritus, urticaria

**Dose**

- Initially 10 mg once daily; if necessary increased to 20 mg once daily; max. 40 mg daily

**Ometec** (Daiichi Sankyo)

**Tablets**, f/c, olmesartan medoxomil 10 mg, net price 28-tab pack = £10.95; 20 mg, 28-tab pack = £12.95; 40 mg, 28-tab pack = £17.50

**With calcium-channel blocker**

**Note** For hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on amlodipine, see section 2.6.2

**Sevikar** (Daiichi Sankyo)

**Tablets** 20/5, white, f/c, olmesartan medoxomil 20 mg, amlodipine (as besilate) 5 mg, net price 28-tab pack = £16.95.

**Tablets** 40/5, ivory, f/c, olmesartan medoxomil 40 mg, amlodipine (as besilate) 5 mg, net price 28-tab pack = £16.95.

**Tablets** 40/10, brownish-red, f/c, olmesartan medoxomil 40 mg, amlodipine (as besilate) 10 mg, net price 28-tab pack = £16.95.

**With diuretic**

**Note** For hypertension not adequately controlled with olmesartan alone. For prescribing information on thiazides, see section 2.2.1.

**Ometec Plus** (Daiichi Sankyo)

**Tablets**, f/c, olmesartan medoxomil 20 mg, hydrochlorothiazide 12.5 mg (red-yellow), net price 28-tab pack = £12.95; olmesartan medoxomil 20 mg, hydrochlorothiazide 25 mg (pink), 28-tab pack = £12.95; olmesartan medoxomil 40 mg, hydrochlorothiazide 12.5 mg (red-yellow), 28-tab pack = £17.50

**TELMSARTAN**

**Indications** hypertension (see also notes above); prevention of cardiovascular events in patients with established atherosclerotic cardiovascular disease, or type 2 diabetes mellitus with target-organ damage

**Cautions** see notes above

**Hepatic impairment** 20–40 mg once daily in mild or moderate impairment; avoid in severe impairment or biliary obstruction

**Renal impairment** manufacturer advises initial dose of 20 mg once daily in severe impairment

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also gastrointestinal disturbances; chest pain; influenza-like symptoms including pharyngitis and sinusitis; urinary-tract infection; arthralgia, myalgia, back pain, leg cramps; eczema; less commonly dry mouth, flatulence, anxiety, vertigo, tendinitis-like symptoms, abnormal vision, increased sweating; rarely Bradycardia, tachycardia, dyspnoea, insomnia, depression, blood disorders, increase in uric acid, eosinophilia, rash, and pruritus; syncope and asthenia also reported

**Dose**

- Hypertension, usually 40 mg once daily (but 20 mg may be sufficient), increased if necessary after at least 4 weeks, to max. 80 mg once daily

- Prevention of cardiovascular events, 80 mg once daily

**Micardis** (Boehringer Ingelheim)

**Tablets**, telmisartan 20 mg, net price 28-tab pack = £8.00; 40 mg, 28-tab pack = £12.50; 80 mg, 28-tab pack = £17.00
2.6 Nitrates, calcium-channel blockers, and other antianginal drugs

### Nitrates

**Diovan**
- **Capsules**, valsartan 40 mg (grey), net price 28-caps pack = £13.97; 80 mg (grey/pink), 28-caps pack = £13.97; 160 mg (dark grey/pink), 28-caps pack = £18.41
- **Tablets**, f/c, valsartan 40 mg (yellow, scored), net price 7-tab pack = £3.49; 320 mg (dark grey-violet), 28-tab pack = £20.23

### Calcium-channel blockers

**Co-Diovan**
- **Tablets** 80/12.5, orange, f/c, valsartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £13.97

**Micardis Plus**
- **Tablets** 40/12.5, red/white, telmisartan 40 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £12.50
- **Tablets** 80/12.5, red/white, telmisartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £17.00
- **Tablets** 80/25, yellow/white, telmisartan 80 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £17.00

### Other antianginal drugs

**ALISKIREN**
- **Indications** essential hypertension
- **Cautions** patients taking concomitant diuretics, on a low-sodium diet, or who are dehydrated (first doses may cause hypotension—initiate with care); renal artery stenosis; patients at risk of renal impairment; monitor plasma-potassium concentration and renal function in diabetes mellitus and heart failure; interactions: Appendix 1 (aliskiren)
- **Renal impairment** caution in renal artery stenosis or if eGFR less than 30 mL/minute/1.73 m²—no information available; monitor plasma-potassium concentration
- **Pregnancy** manufacturer advises avoid—no information available; other drugs acting on the renin-angiotensin system have been associated with fetal malformations and neonatal death
- **Breast-feeding** present in milk in animal studies—manufacturer advises avoid
- **Side-effects** diarrhoea; less commonly rash; rarely angioedema; acute renal failure (reversible on discontinuation of treatment), anaemia, and hyperkalaemia also reported
- **Dose**
  - **ADULT** over 18 years, 150 mg once daily, increased if necessary to 300 mg once daily

**Rasilez**
- **Tablets**, f/c, aliskiren (as hemifumarate) 150 mg (pink), net price 28-tab pack = £19.80; 300 mg (red), net price 28-tab pack = £23.80. Label: 21

### Peripheral vasodilators and related drugs

**Nitrites**
- **Diethylnitrite**
- **Isosorbide dinitrate**
- **Isosorbide nitrate**

### With diuretic

**Note** For patients with hypertension not adequately controlled by telmisartan alone. For prescribing information on thiazides, see section 2.2.1

### With diuretic

**Note** For hypertension not adequately controlled by valsartan alone. For prescribing information on thiazides, see section 2.2.1

### Renin inhibitors

Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I. **Aliskiren** is licensed for the treatment of hypertension, either alone or in combination with other antihypertensives. The Scottish Medicines Consortium (p. 4) has advised (January 2010) that aliskiren (**Rasilez**) is not recommended for use within NHS Scotland.
left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation, which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

For details on the management of stable angina and acute coronary syndromes, see section 2.10.1.

2.6.1 Nitrates

Nitrates have a useful role in angina (for details on the management of stable and unstable angina, see section 2.10.1). Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when angina is severe or when patients are unusually sensitive to the effects of nitrates.

Sublingual glyceryl trinitrate is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The aerosol spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by modified-release and transdermal preparations (but tolerance may develop, see below).

Isosorbide dinitrate is active sublingually and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis, although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for modified-release preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate or isosorbide dinitrate may be tried by intravenous injection when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

Tolerance Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 8 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for several consecutive hours in each 24 hours; in these cases of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

GLYCERYL TRINITRATE

Indications

anal fissure (section 1.7.4); extravasation (section 10.3)

Sublingual prophylaxis and treatment of angina

Buccal: prophylaxis and treatment of angina; adjunct in unstable angina; acute and congestive heart failure

Injection: control of hypertension and myocardial ischaemia during and after cardiac surgery; induction of controlled hypotension during surgery; congestive heart failure; unstable angina

Transferable: see under preparations below

Cautions

hypothyroidism; malnutrition; hypothermia; recent history of myocardial infarction; heart failure due to obstruction; hypoxaemia or other ventilation and perfusion abnormalities; susceptibility to angle-closure glaucoma; metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy; avoid abrupt withdrawal; monitor blood pressure and heart rate during intravenous infusion; tolerance (see notes above); interactions: Appendix I (nitrates)

Contra-indications

hypersensitivity to nitrates; hypertensive conditions and hypovolaemia; hypertrophic cardiomyopathy; aortic stenosis; cardiac tamponade; constrictive pericarditis; mitral stenosis; toxic pulmonary oedema; head trauma; cerebral haemorrhage; cerebrovascular disease; marked anaemia

Hepatic impairment caution in severe impairment

Renal impairment manufacturers advise use with caution in severe impairment

Pregnancy not known to be harmful

Breast-feeding no information available—manufacturers advise use only if potential benefit outweighs risk

Side-effects

postural hypotension, tachycardia (but paradoxical bradycardia also reported); throbbing headache, dizziness; less commonly nausea, vomiting, heartburn, flushing, syncope, temporary hypoxaemia, rash, application site reactions with transdermal patches; very rarely angle-closure glaucoma

Injection Specific side-effects following injection (particular if given too rapidly) include severe hypotension, diaphoresis, apprehension, restlessness, muscle twitching, retrosternal discomfort, palpitation, abdominal pain, prolonged administration has been associated with methaemoglobinemia

Dose

Sublingually, 0.3–1 mg, repeated as required; see also under preparations

By buccal administration, see under preparation

By intravenous infusion, 10–200 micrograms/minute, adjusted according to response; max. 400 micrograms/minute; consult product literature for recommended starting doses specific to indication

By transdermal application, see under preparations

Short-acting tablets and sprays

Glyceryl Trinitrate (Non-proprietary)

Sublingual tablets, glyceryl trinitrate 300 micrograms, net price 100 = £2.71; 500 micrograms, 100 = £3.27; 600 micrograms, 100 = £12.31. Label: 16

Note Glyceryl trinitrate tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use

Aerosol spray, glyceryl trinitrate 400 micrograms/ metered dose, net price 200-dose unit = £3.13

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth
2.6.1 Nitrates

**Coro-Nitro Pump Spray®** (Aytont Saunders)  
**Aerosol spray,** glyceryl trinitrate 400 micrograms/metered dose, net price 200-dose unit = £3.13

**Dose**  
Treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth.

**Glytrin Spray®** (Sanofi-Aventis)  
**Aerosol spray,** glyceryl trinitrate 400 micrograms/metered dose, net price 200-dose unit = £3.29

**Dose**  
Treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth.

**Cautions**  
Flammable.

**GTN 300 mcg** (Martindale)  
**Sublingual tablets,** glyceryl trinitrate 300 micrograms, net price 100 = £2.71. Label: 16

**Nitroglycerin Pumpspray®** (Merck Serono)  
**Aerosol spray,** glyceryl trinitrate 400 micrograms/metered dose, net price 200-dose unit = £3.44

**Dose**  
Treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth.

**Nitromin®** (Egis)  
**Aerosol spray,** glyceryl trinitrate 400 micrograms/metered dose, net price 180-dose unit = £2.63, 200-dose unit = £2.71

**Dose**  
Treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth.

**Cautions**  
Flammable.

**Nitrolingual Pumpspray**  
**Injection**, glyceryl trinitrate 5 mg/mL. To be diluted before use or given undiluted with syringe pump. Net price 50-mL vial = £15.90

**Injection**, glyceryl trinitrate 1 mg/mL. To be diluted before use. Net price 5-mL amp = £6.49; 10-mL amp = £12.98

**Excipients** may include ethanol, propylene glycol (see Excipients, p. 2)

**Nitrospray®** (UCB Pharma)  
**Injection**, glyceryl trinitrate 1 mg/mL. To be diluted before use or given undiluted with syringe pump. Net price 10-mL amp = £5.88; 50-mL bottle = £13.77

**Excipients** include propylene glycol (see Excipients, p. 2)

**Nitronal®** (Merck Serono)  
**Injection**, glyceryl trinitrate 1 mg/mL. To be diluted before use or given undiluted with syringe pump. Net price 5-mL vial = £1.80; 50-mL vial = £14.76

### Transdermal preparations

**Deponit®** (UCB Pharma)  
**Patches,** self-adhesive, transparent, glyceryl trinitrate, '5' patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £12.77; '10' patch (releasing approx. 10 mg/24 hours), 28 = £14.06

**Dose**  
Prophylaxis of angina, apply one '5' or one '10' patch to lateral chest wall, upper arm, thigh, abdomen, or shoulder. Increase to two '10' patches every 24 hours if necessary; replace every 24 hours, site replacement patch on different area; see also notes above (Tolerance).

**Minitran®** (Meda)  
**Patches,** self-adhesive, transparent, glyceryl trinitrate, '5' patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 30 = £11.62; '10' patch (releasing approx. 10 mg/24 hours), 30 = £12.87; '15' patch (releasing approx. 15 mg/24 hours), 30 = £14.19

**Dose**  
Prophylaxis of angina, apply one '5' patch to chest or upper arm; replace every 24 hours, site replacement patch on different area; adjust dose according to response; see also notes above (Tolerance).

Maintenance of venous patency ('5' patch only), consult product literature.

**Nitro-Dur®** (Schering-Plough)  
**Patches,** self-adhesive, buff, glyceryl trinitrate, '0.2 mg/h' patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £10.59; '0.4 mg/h' patch (releasing approx. 10 mg/24 hours), 28 = £11.72; '0.6 mg/h' patch (releasing approx. 15 mg/24 hours), 28 = £12.90

**Dose**  
Prophylaxis of angina, apply one '0.2 mg/h' patch to chest or outer upper arm; replace every 24 hours, site replacement patch on different area; adjust dose according to response; max. 15 mg in 24 hours; see also notes above (Tolerance).

**Perculot®** (Aspire)  
**Ointment,** glyceryl trinitrate 2%, net price 60 g = £59.65. Counselling, see administration below

**Excipients** include wool fat

**Dose**  
Prophylaxis of angina, usual dose 1–2 inches of ointment measured on to Appletrides®, and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, every 3–4 hours as required; to determine dose, ½ inch on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch

**Note**  
Approx. 800 micrograms/hour absorbed from 1 inch of ointment

### ISOSORBIDE DINITRATE

#### Indications  
Prophylaxis and treatment of angina; left ventricular failure

**Cautions**  
see under Glyceryl Trinitrate

**Contra-indications**  
see under Glyceryl Trinitrate

**Hepatic impairment**  
see under Glyceryl Trinitrate

**Renal impairment**  
see under Glyceryl Trinitrate

**Pregnancy**  
may cross placenta—manufacturers advise avoid unless potential benefit outweighs risk

**Breast-feeding**  
see under Glyceryl Trinitrate
Isosorbide Mononitrate
• Initially 20 mg 2–3 times daily.
• By mouth, daily in divided doses, angina 30–120 mg, left ventricular failure 40–160 mg, up to 240 mg if required.
• By intravenous infusion, 2–10 mg/hour; higher doses up to 20 mg/hour may be required.

Short-acting tablets and sprays
Isosorbide Dinitrate (Non-proprietary)
Tablets, isosorbide dinitrate 10 mg, net price 56-tab pack = £12.24; 20 mg, 56-tab pack = £13.50

Angitak® (LPC)
Aerosol spray, isosorbide dinitrate 1.25 mg/metered dose, net price 200-dose unit = £3.95
Dose: treatment or prophylaxis of angina, spray 1–3 doses under tongue whilst holding breath; allow 30 second interval between each dose.

Modified-release preparations
Isoket Retard® (UCB Pharma)
Retard-20 tablets, m/r, scored, isosorbide dinitrate 20 mg, net price 56-tab pack = £2.58. Label: 25
Retard-40 tablets, m/r, scored, isosorbide dinitrate 40 mg, net price 56-tab pack = £6.36. Label: 25
Dose: prophylaxis of angina, 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses.

Parenteral preparations
Isoket® (UCB Pharma) (w)
Injection 0.1%, isosorbide dinitrate 1 mg/mL. To be diluted before use. Net price 10-mL amp = £2.69
Note: Glass or polyethylene infusion apparatus is preferable, loss of potency if PVC used.

Isosorbide Mononitrate
Indications: prophylaxis of angina; adjunct in congestive heart failure
Cautions: see under Glyceryl Trinitrate
Contra-indications: see under Glyceryl Trinitrate
Hepatic impairment: see under Glyceryl Trinitrate
Renal impairment: see under Glyceryl Trinitrate
Pregnancy: manufacturers advise avoid unless potential benefit outweighs risk
Breast-feeding: see under Glyceryl Trinitrate
Side-effects: see under Glyceryl Trinitrate
Dose:
• Initially 20 mg 2–3 times daily or 40 mg twice daily (10 mg twice daily in those who have not previously received nitrates); up to 120 mg daily in divided doses if required.

Isosorbide Mononitrate (Non-proprietary)
Tablets, isosorbide mononitrate 10 mg, net price 56 = £1.05; 20 mg, 56 = £1.08; 40 mg, 56 = £1.40. Label: 25
Brands include: Anginec®

Elantan® (UCB Pharma)
Elantan 10 tablets, scored, isosorbide mononitrate 10 mg, net price 56-tab pack = £1.32; 84-tab pack = £4.97. Label: 25
Elantan 20 tablets, scored, isosorbide mononitrate 20 mg, net price 56-tab pack = £1.73; 84-tab pack = £8.13. Label: 25
Elantan 40 tablets, scored, isosorbide mononitrate 40 mg, net price 56-tab pack = £2.81; 84-tab pack = £10.56. Label: 25

Ismo® (Riemser)
Ismo 10 tablets, isosorbide mononitrate 10 mg, net price 60-tab pack = £3.31. Label: 25
Ismo 20 tablets, scored, isosorbide mononitrate 20 mg, net price 60-tab pack = £4.85. Label: 25

Modified release
Chemydur® 60XL (Sovereign) (w)
Tablets, m/r, scored, isosorbide mononitrate 60 mg, net price 28-tab pack = £3.99. Label: 25
Dose: prophylaxis of angina, 1 tablet in the morning (half a tablet for 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets.

Elantan LA® (UCB Pharma)
Elantan LA 25 capsules, m/r, brown/white, enclosing white micropellets, isosorbide mononitrate 25 mg, net price 28-cap pack = £2.64. Label: 25
Dose: prophylaxis of angina, 1 capsule in the morning, increased if necessary to 2 capsules
Elantan LA 50 capsules, m/r, brown/pink, enclosing white micropellets, isosorbide mononitrate 50 mg, net price 28-cap pack = £3.69. Label: 25
Dose: prophylaxis of angina, 1 capsule daily in the morning, increased if necessary to 2 capsules

Imdur® (AstraZeneca)
Durules® (= tablets m/r), yellow, f/c, scored, isosorbide mononitrate 60 mg, net price 28-cap pack = £10.50. Label: 25
Dose: prophylaxis of angina, 1 tablet in the morning (half a tablet if headache occurs), increased to 2 tablets in the morning if required.

Isib 60XL® (Ranbaxy)
Tablets, m/r, scored, yellow, isosorbide mononitrate 60 mg, net price 28-tab pack = £8.15. Label: 25
Dose: prophylaxis of angina, 1 tablet in the morning (half a tablet for 2–4 days if headache occurs), increased if necessary to 2 tablets
Note: Also available as Cibral 60XL®, Ximox 60XL®

Ismo Retard® (Riemser)
Tablets, m/r, s/c, isosorbide mononitrate 40 mg, net price 30-tab pack = £10.71. Label: 25
Dose: prophylaxis of angina, 1 tablet daily in morning

Isodur® (Galeni)
Isodur 25XL capsules, m/r, brown/white, isosorbide mononitrate 25 mg, net price 28-cap pack = £5.50. Label: 25
Isodur 50XL capsules, m/r, brown/red, isosorbide mononitrate 50 mg, net price 28-cap pack = £6.50. Label: 25
Dose: prophylaxis of angina, 25–50 mg daily in the morning, increased if necessary to 50–100 mg once daily

Isotard® (ProStrakan)
Isotard 25XL tablets, m/r, ivory, isosorbide mononitrate 25 mg, net price 28-tab pack = £5.95. Label: 25
Isotard 40XL tablets, m/r, ivory, isosorbide mononitrate 40 mg, net price 28-tab pack = £6.78. Label: 25
Isotard 50XL tablets, m/r, ivory, isosorbide mononitrate 50 mg, net price 28-tab pack = £6.78. Label: 25
Isotard 60XL tablets, m/r, ivory, isosorbide mononitrate 60 mg, net price 28-tab pack = £5.75. Label: 25
Dose: prophylaxis of angina, 25–60 mg daily in the morning, increased if necessary to 60–120 mg daily

Modisal XL® (Sandoz)
Tablets, m/r, ivory, isosorbide mononitrate 60 mg, net price 28-tab pack = £10.36. Label: 25
Dose: prophylaxis of angina, 1 tablet daily in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily.
2.6.2 Calcium-channel blockers

Calcium-channel blockers (less correctly called ‘calcium-antagonists’) interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil, diltiazem, and the dihydropyridine calcium-channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine). Verapamil and diltiazem should usually be avoided in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil is used for the treatment of angina (section 2.10.1), hypertension (section 2.5), and arrhythmias (section 2.3.2). It is a highly negatively inotropic calcium-channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should not be used with beta-blockers (see p. 153). Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil, and unlike verapamil has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work. Short-acting formulations of nifedipine are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia. Nicardipine has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine, amlodipine, and felodipine are used for the treatment of angina (section 2.10.1) or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Iratazpine, lacidipine, and lercanidipine have similar effects to those of nicardipine and nifedipine; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem is effective in most forms of angina (section 2.10.1); the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

Unstable angina

Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem or verapamil should be reserved for patients resistant to treatment with beta-blockers.

Withdrawal

There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of angina.

AMLODIPINE

Indications hypertension, prophylaxis of angina
Cautions acute porphyria (but see section 9.8.2); interactions: Appendix 1 (calcium-channel blockers)
Contra-indications cardiogenic shock, unstable angina, significant aortic stenosis
Hepatic impairment may need dose reduction—half-life prolonged
Pregnancy no information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension
Breast-feeding manufacturer advises avoid—no information available

Monoxam® SR, capsules, m/r, isosorbide mononitrate 40 mg, net price 28-cap pack = £6.52; 60 mg, 28-cap pack = £8.86. Label: 25
Note Available as Anerge SR®

Monoxam XL tablets, m/r, isosorbide mononitrate 60 mg, net price 28-tab pack = £5.25. Label: 25
Note Prophylaxis of angina, in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets

Monoxim XL® (TEVA UK) Tablets, m/r, isosorbide mononitrate 60 mg, net price 28-tab pack = £3.98. Label: 25
Note Prophylaxis of angina, 1 tablet daily in the morning (half a tablet daily for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily

Monosorb XL 60® (Dexcel) Tablets, m/r, f/c, isosorbide mononitrate 60 mg, net price 28-tab pack = £16.66. Label: 25
Note Prophylaxis of angina, 1 tablet daily in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets

Zemon® (Neolab)
Zemon 40XL tablets, m/r, t/c, isosorbide mononitrate 40 mg, net price 28-tab pack = £14.25. Label: 25
Zemon 60XL tablets, scored, m/r, t/c, isosorbide mononitrate 60 mg, net price 28-tab pack = £11.14. Label: 25
Note Prophylaxis of angina, 40–60 mg daily in the morning (half a 60 mg tablet may be given for 2–4 days to minimise possibility of headache), increased if necessary to 80–120 mg once daily
Side-effects abdominal pain, nausea; palpitation, flushing, oedema; headache, dizziness, sleep disturbances, fatigue; less commonly gastro-intestinal disturbances, dry mouth, taste disturbances, hypotension, syncope, chest pain, dyspnoea, rhinitis, mood changes, asthenia, tremor, paraesthesia, urinary disturbances, impotence, gynaecomastia, weight changes, myalgia, muscle cramps, back pain, arthralgia, visual disturbances, tinnitus, pruritus, rashes (including isolated reports of erythema multiforme), sweating, alopecia, purpura, and skin discolouration; very rarely gastritis, pancreatitis, hepatitis, jaundice, cholestasis, gingival hyperplasia, myocardial infarction, arrhythmias, tachycardia, vasculitis, coughing, peripheral neuropathy, hyperglycaemia, thrombocytopenia, angioedema, and urticaria

Dose
- Hypertension or angina, initially 5 mg once daily; max. 10 mg once daily
Note Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

Amlodipine (Non-proprietary)

Tablets, amlodipine (as maleate or as mesilate) 5 mg, net price 28-tab pack = £1.05; 10 mg, 28-tab pack = £1.20
Brands include Amlodin®

Istin® (Pfizer)
Tablets, amlodipine (as besilate) 5 mg, net price 28-tab pack = £1.10; 10 mg, 28-tab pack = £1.55

With valsartan
Note For hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on valsartan, see section 2.5.5.2

Exforge® (Novartis) ▼

Tablets 5/80, I/c, dark yellow, amlodipine 5 mg, valsartan 80 mg, net price 28-tab pack = £13.97
Tablets 5/160, I/c, dark yellow, amlodipine 5 mg, valsartan 160 mg, net price 28-tab pack = £18.41
Tablets 10/160, I/c, light yellow, amlodipine 10 mg, valsartan 160 mg, net price 28-tab pack = £18.41

DILTIAZEM HYDROCHLORIDE

Indications prophylaxis and treatment of angina; hypertension

Cautions heart failure or significantly impaired left ventricular function, bradycardia (avoid if severe), first degree AV block, or prolonged PR interval; interactions: Appendix 1 (calcium-channel blockers)

Contra-indications severe bradycardia, left ventricular failure with pulmonary congestion, second- or third-degree AV block (unless pacemaker fitted), sick sinus syndrome; acute porphyria (section 9.6.2)

Hepatic impairment reduce-dose

Renal impairment start with smaller dose

Pregnancy avoid

Breast-feeding significant amount present in milk—no evidence of harm but avoid unless no safer alternative

Side-effects bradycardia, sino-atrial block, AV block, palpitation, dizziness, hypotension, malaise, asthenia, headache, hot flushes, gastro-intestinal disturbances, oedema (notably of ankles); rarely rashes (including erythema multiforme and exfoliative dermatitis), photosensitivity; hepatitis, gynaecomastia, gum hyperplasia, extrapyramidal symptoms, depression reported

Dose
- Angina, 60 mg 3 times daily (elderly initially twice daily); increased if necessary to 360 mg daily
- Longer-acting formulations, see under preparations below

Standard formulations
Note These formulations are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation ‘modified-release’ their duration of action corresponds to that of tablets requiring administration 3 times daily

Diltiazem (Non-proprietary) ▼

Tablets, m/r (but see note above), diltiazem hydrochloride 60 mg, net price 84 = £2.93. Label: 25
Brands include Opti®

Tildiem® (Sanofi-Aventis) ▼
Tablets, m/r (but see note above), off-white, diltiazem hydrochloride 60 mg, net price 90-tab pack = £7.96. Label: 25

Longer-acting formulations
Note Different versions of modified-release preparations containing more than 60 mg diltiazem hydrochloride may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed

Adizem-SR® (Napp) ▼
Capsules, m/r, diltiazem hydrochloride 90 mg (white), net price 56-cap pack = £8.45; 120 mg (brown/white), 56-cap pack = £9.40; 180 mg (brown/white), 56-cap pack = £14.08. Label: 25
Tablets, m/r, I/c, scored, diltiazem hydrochloride 120 mg, net price 56-tab pack = £14.72. Label: 25
Dose mild to moderate hypertension, usually 120 mg twice daily (dose form not appropriate for initial dose titration)
Angina, initially 90 mg twice daily (elderly, dose form not appropriate for initial dose titration), increased to 180 mg twice daily if required

Adizem-XL® (Napp) ▼
Capsules, m/r, diltiazem hydrochloride 120 mg (pink/blue), net price 28-cap pack = £9.09; 180 mg (dark pink/blue), 28-cap pack = £10.32; 200 mg (brown), 28-cap pack = £6.66; 240 mg (red/blue), 28-cap pack = £11.46; 300 mg (maroon/blue), 28-cap pack = £9.09. Label: 25
Dose angina and mild to moderate hypertension, initially 240 mg once daily, increased if necessary to 300 mg once daily; in elderly and in hepatic or renal impairment, initially 120 mg daily

Angitil SR® (Chiesi) ▼
Capsules, m/r, diltiazem hydrochloride 90 mg (white), net price 56-cap pack = £7.03; 120 mg (brown), 56-cap pack = £6.91; 180 mg (brown), 56-cap pack = £13.27. Label: 25
Dose angina and mild to moderate hypertension, initially 90 mg twice daily; increased if necessary to 120 mg or 180 mg twice daily

Angitil XL® (Chiesi) ▼
Capsules, m/r, diltiazem hydrochloride 240 mg (white), net price 28-cap pack = £7.94; 300 mg (yellow), 28-cap pack = £8.98. Label: 25
Dose angina and mild to moderate hypertension, initially 240 mg once daily (elderly and in hepatic and renal impairment, dose form not appropriate for initial dose titration), increased if necessary to 300 mg once daily
2.6.2 Calcium-channel blockers

CalciCard CR® (IVAX) 
Tablets, m/r, both f/c, diltiazem hydrochloride 90 mg, net price 56-tab pack = £6.33; 120 mg, 56-tab pack = £7.04. Label: 25

Dose mild to moderate hypertension, initially 90 mg or 120 mg twice daily; up to 360 mg daily may be required; ELDERLY and in hepatic and renal impairment, initially 120 mg once daily; up to 240 mg daily may be required

Angina, initially 90 mg or 120 mg twice daily; up to 480 mg daily in divided doses may be required. ELDERLY and in hepatic and renal impairment, dose form not appropriate for initial dose titration; up to 240 mg daily may be required

Dilzem SR® (Generics) 
Capsules, m/r, both f/c, diltiazem hydrochloride 60 mg (pink/white), net price 56-cap pack = £6.03; 90 mg (pink/yellow), 56-cap pack = £10.33; 120 mg (pink/orange), 56-cap pack = £11.49. Label: 25

Dose angina and mild to moderate hypertension, initially 90 mg twice daily; increased if necessary to up to 180 mg twice daily; ELDERLY and in hepatic or renal impairment, initially 60 mg twice daily; max. 90 mg twice daily

Dilzem XL® (Cephalon) 
Tablets, m/r, all beige, diltiazem hydrochloride 60 mg, net price 56-cap pack = £6.03; 90 mg, 56-cap pack = £11.29; 120 mg, 56-cap pack = £12.89. Label: 25

Dose angina and mild to moderate hypertension, initially 90 mg twice daily (elderly 60 mg twice daily); up to 180 mg twice daily may be required

Dilzem SR® (Cephalon) 
Capsules, m/r, both f/c, diltiazem hydrochloride 120 mg, net price 28-cap pack = £7.78; 180 mg, 28-cap pack = £11.55; 240 mg, 28-cap pack = £11.03. Label: 25

Dose angina and mild to moderate hypertension, initially 90 mg once daily; increased if necessary to 120 mg once daily; ELDERLY and in hepatic or renal impairment, initially 60 mg once daily; max. 90 mg twice daily

Dilzem XL® (Cephalon) 
Capsules, m/r, diltiazem hydrochloride 120 mg, net price 28-cap pack = £7.78; 180 mg, 28-cap pack = £11.55; 240 mg, 28-cap pack = £11.03. Label: 25

Dose angina and mild to moderate hypertension, initially 180 mg once daily (elderly and in hepatic and renal impairment, 120 mg once daily); if necessary may be increased to 360 mg once daily

Slozem® (Merck Serono) 
Capsules, m/r, diltiazem hydrochloride 120 mg (pink/clear), net price 28-cap pack = £7.00; 180 mg (pink/clear), 28-cap pack = £7.80; 240 mg (red/clear), 28-cap pack = £8.20; 300 mg (red/white), 28-cap pack = £8.50. Label: 25

Dose angina and mild to moderate hypertension, initially 240 mg once daily (elderly and in hepatic and renal impairment, 120 mg once daily); if necessary may be increased to 360 mg once daily

Tildium LA® (Sanofi-Aventis) 
Capsules, m/r, diltiazem hydrochloride 200 mg (pink/grey, containing white pellets), net price 28-cap pack = £6.27; 300 mg (white/yellow, containing white pellets), 28-cap pack = £7.22. Label: 25

Dose angina and mild to moderate hypertension, initially 200 mg once daily before or with food, increased if necessary to 300–400 mg daily. ELDERLY and in hepatic or renal impairment, initially 200 mg daily, increased if necessary to 300 mg daily

Tildium Retard® (Sanofi-Aventis) 
Tablets, m/r, diltiazem hydrochloride 90 mg, net price 56-tab pack = £7.27; 120 mg, 56-tab pack = £7.15. Label: 25

Counselling Tablet membrane may pass through gastrointestinal tract unchanged, but being porous has no effect on efficacy

Dose mild to moderate hypertension, initially 90 mg or 120 mg twice daily; increased if necessary to 360 mg daily in divided doses; ELDERLY and in hepatic or renal impairment, initially 120 mg once daily, increased if necessary to 240 mg daily twice daily; if necessary may be increased to 480 mg daily in divided doses; ELDERLY and in hepatic or renal impairment, dose form not appropriate for initial titration; up to 120 mg twice daily may be required

Viazem XL® (Generics) 
Capsules, m/r, diltiazem hydrochloride 120 mg (lavender), net price 28-cap pack = £6.60; 180 mg (white/blue-green), 28-cap pack = £7.36; 240 mg (blue-green/lavender), 28-cap pack = £7.74; 300 mg (white/lavender), 28-cap pack = £8.03, 360 mg (blue-green), 28-cap pack = £13.85. Label: 25

Dose angina and mild to moderate hypertension, initially 180 mg once daily, adjusted according to response to 240 mg once daily; max. 360 mg once daily; ELDERLY and in hepatic or renal impairment, initially 120 mg once daily, adjusted according to response

Zemtard® (Astellas) 
Capsules, m/r, brown/orange, diltiazem hydrochloride 120 mg, net price 28-cap pack = £6.10. Label: 25

Zemtard 120XL capsules, m/r, brown/orange, diltiazem hydrochloride 120 mg, net price 28-cap pack = £6.10. Label: 25

Zemtard 180XL capsules, m/r, grey/pink, diltiazem hydrochloride 180 mg, net price 28-cap pack = £6.20. Label: 25

Zemtard 240XL capsules, m/r, blue, diltiazem hydrochloride 240 mg, net price 28-cap pack = £6.30. Label: 25

Zemtard 300XL capsules, m/r, white/blue, diltiazem hydrochloride 300 mg, net price 28-cap pack = £6.70. Label: 25

Dose angina and mild to moderate hypertension, 180–300 mg once daily, increased if necessary to 360 mg once daily in hypertension and to 480 mg once daily in angina. ELDERLY and in hepatic or renal impairment, initially 120 mg once daily

**FELODIPINE**

**Indications** hypertension, prophylaxis of angina

**Cautions** withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment or if cardiogenic shock develops; severe left ventricular dysfunction; avoid grapefruit juice (may affect metabolism); acute porphyria (but see section 9.8.2);

**Interactions:** Appendix 1 (calcium-channel blockers)

**Contra-indications** unstable angina, uncontrolled heart failure; significant aortic stenosis; within 1 month of myocardial infarction

**Hepatic impairment** reduce dose

**Pregnancy** avoid; toxicity in animal studies; may inhibit labour

**Breast-feeding** present in milk

**Side-effects** flushing, headache, palpitation, dizziness, fatigue, gravitational oedema; rarely rash, pruritus, cutaneous vasculitis, gum hyperplasia, urinary frequency, impotence, fever

**Dose**

- Hypertension, initially 5 mg (elderly 2.5 mg) daily in the morning; usual maintenance 5–10 mg once daily; doses above 20 mg daily rarely needed
- Angina, initially 5 mg daily in the morning; increased if necessary to 10 mg once daily

**Felodipine** (Non-proprietary)

**Tablets**

- Felodipine 2.5 mg, net price 28-tab pack = £6.31; 5 mg, 28-tab pack = £4.21; 10 mg, 28-tab pack = £5.66, 30-tab pack = £12.87. Label: 25

**Brands include Cardioplen XL®, Zemtard XL®,** Felogen XL®, Plendil®, Viazem XL®

**Plendil** (AstraZeneca) 
Tablets, m/r, felodipine 2.5 mg (yellow), net price 28-tab pack = £6.31; 5 mg (pink), 28-tab pack = £4.21; 10 mg (brown), 28-tab pack = £5.66. Label: 25
**ISRADIPINE**

**Indications** hypertension

**Cautions** sick sinus syndrome (if pacemaker not fitted); avoid grapefruit juice (may affect metabolism); poor cardiac reserve; **interactions:** Appendix 1 (calcium-channel blockers)

**Contra-indications** cardiogenic shock; symptomatic or tight aortic stenosis; during or within 1 month of myocardial infarction; unstable angina; acute porphyria (section 9.8.2)

**Hepatic impairment** reduce dose

**Renal impairment** reduce dose

**Pregnancy** may inhibit labour; risk to fetus should be balanced against risk of uncontrolled maternal hypertension

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** abdominal discomfort; tachycardia, palpitation, flushing, peripheral oedema; dyspnoea; headache; fatigue, dizziness; polyuria; rash; less commonly hypertension, weight gain; very rarely vomiting, nausea; tumours, pulmonary oedema, anorexia, drowsiness, arrhythmia, bradycardia, heart failure; cough, depression, paraesthesia, anxiety, erectile dysfunction, blood disorders (such as thrombocytopenia, leucopenia, anaemia), arthralgia, visual disturbance, hypersensitivity reactions; hepatitis and gynaecomastia also reported

**Dose**
- 2.5 mg twice daily, increased if necessary after 3–4 weeks to 5 mg twice daily (exceptionally up to 10 mg twice daily); **Elderly** (or in hepatic or renal impairment) 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response, maintenance dose of 2.5 mg or 5 mg once daily may be sufficient

**Presca** (Novartis) **Tablets**
- Yellow, scored, isradipine 2.5 mg, net price 56-tab pack = £16.54

**NICARDIPINE HYDROCHLORIDE**

**Indications** prophylaxis of angina; mild to moderate hypertension

**Cautions** withdraw if ischaemic pain occurs or existing pain worsens within 30 minutes of initiating treatment or increasing dose; congestive heart failure or significantly impaired left ventricular function; elderly; avoid grapefruit juice (may affect metabolism); **interactions:** Appendix 1 (calcium-channel blockers)

**Contra-indications** cardiogenic shock; advanced aortic stenosis; unstable or acute attacks of angina; avoid within 1 month of myocardial infarction; acute porphyria (section 9.8.2)

**Hepatic impairment** half-life prolonged in severe impairment—may need dose reduction

**Renal impairment** start with small dose

**Pregnancy** may inhibit labour; toxicity in animal studies; manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** dizziness, headache, peripheral oedema, flushing, palpitation, nauscea; also gastro-intestinal disturbances, drowsiness, insomnia, tinnitus, hypotension, rashes, dyspnoea, paraesthesia, frequency of micturition; thrombocytopenia, depression and impotence reported

**Motens®** (Boehringer Ingelheim) **Tablets**, both f/c, lercanidipine 2 mg, net price 28-tab pack = £2.95; 4 mg (scored), 28-tab pack = £3.10

**LERCANIDIPINE HYDROCHLORIDE**

**Indications** mild to moderate hypertension

**Cautions** left ventricular dysfunction; sick sinus syndrome (if pacemaker not fitted); avoid grapefruit juice (may affect metabolism); **interactions:** Appendix 1 (calcium-channel blockers)

**Contra-indications** aortic stenosis; unstable angina, uncontrolled heart failure; within 1 month of myocardial infarction; acute porphyria (section 9.8.2)

**Hepatic impairment** avoid in severe disease

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** avoid if eGFR less than 30 mL/minute/1.73 m²

**Breast-feeding** manufacturer advises avoid

**Side-effects** less commonly flushing, peripheral oedema, palpitation, tachycardia, headache, dizziness; rarely gastro-intestinal disturbances, angina, asthenia, drowsiness, polyuria, myalgia, rash; very rarely gingival hyperplasia, myocardial infarction, hypotension

**Dose**
- Initially 10 mg once daily; increased, if necessary, after at least 2 weeks to 20 mg daily

**Lercanidipine Hydrochloride** (Non-proprietary)

**Tablets**, lercanidipine hydrochloride 10 mg, net price 28-tab pack = £5.52; 20 mg, 28-tab pack = £8.56.

Label: 22

**Zanidip®** (Recordati) **Tablets**, f/c, lercanidipine hydrochloride 10 mg (yellow), net price 28-tab pack = £5.70; 20 mg (pink), 28-tab pack = £10.82.

Label: 22

**LACIDIPINE**

**Indications** hypertension

**Cautions** cardiac conduction abnormalities; poor cardiac reserve; avoid grapefruit juice (may affect metabolism); **interactions:** Appendix 1 (calcium-channel blockers)

**Contra-indications** cardiogenic shock, unstable angina, aortic stenosis; avoid within 1 month of myocardial infarction; acute porphyria (section 9.8.2)

**Hepatic impairment** antihypertensive effect possibly increased

**Pregnancy** manufacturer advises avoid; may inhibit labour

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** flushing, palpitation, oedema; headache, dizziness; rarely gastro-intestinal disturbances, gum hyperplasia, aggravation of angina, mood disturbances, asthenia, polyuria, muscle cramps, skin rash (including pruritus and erythema)

**Dose**
- Initially 2 mg as a single daily dose, preferably in the morning; increased after 3–4 weeks to 4 mg daily; then if necessary to 6 mg daily

Label: 22

BNF 61

2. Cardiovascular system

2.6.2 Calcium-channel blockers 131
Cardiovascular system

Dose

- Initially 20 mg 3 times daily increased, after at least three days, to 30 mg 3 times daily (usual range 60–120 mg daily)

Nicardipine (Non-proprietary) [BNF 61]

- Capsules, nicardipine hydrochloride 20 mg, net price 56-cap pack = £4.02; 30 mg, 56-cap pack = £5.16

Cardene® (Astellas) [BNF 61]

- Capsules, nicardipine hydrochloride 20 mg (blue/white), net price 56-cap pack = £6.00; 30 mg (blue/pale blue), 56-cap pack = £6.96

Modified release

Cardene SR® (Astellas) [BNF 61]

- Capsules, m/r, nicardipine hydrochloride 30 mg, net price 56-cap pack = £7.15; 45 mg (blue), 56-cap pack = £10.40. Label: 25
- Dose mild to moderate hypertension, initially 30 mg twice daily; usual effective dose 45 mg twice daily (range 30–60 mg twice daily)

NIFEDIPINE

Indications

- prophylaxis of angina; hypertension;
- Raynaud’s phenomenon

Caution

- see notes above: also withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment; poor cardiac reserve; heart failure or significantly impaired left ventricular function (heart failure deterioration observed); severe hypotension; elderly; diabetes mellitus; avoid grapefruit juice (may affect metabolism); acute porphyria (but see section 9.8.2);
- interactions: Appendix 1 (calcium-channel blockers)

Contra-indications

- cardiacogenic shock; advanced aortic stenosis; within 1 month of myocardial infarction; unstable or acute attacks of angina

Hepatic impairment

dose reduction may be required in severe liver disease

Pregnancy

- may inhibit labour; manufacturer advises avoid before week 20; risk to fetus should be balanced against risk of uncontrolled maternal hypertension; use only if other treatment options are not indicated or have failed

Breast-feeding

- amount too small to be harmful but manufacturers advise avoid

Side-effects

- gastrointestinal disturbance: hypo-tension, oedema, vasodilatation, palpitation; headache, dizziness, lethargy, asthenia; less commonly tachycardia, syncope, chills, nasal congestion, dyspnoea, anxiety, sleep disturbance, vertigo, migraine, paraesthesia, tremor, polyuria, dysuria, nocturia, erectile dysfunction, epistaxis, myalgia, joint swelling, visual disturbance, sweating, hypersensitivity reactions (including angioedema, jaundice, pruritus, urticaria, and rash); rarely anorexia, gum hyperplasia, mood disturbances, hyperglycaemia, male infertility, purpura, and photosensitivity reactions; also reported dysphagia, intestinal obstruction, intestinal ulcer, bezoar formation (with some modified-release preparations), gynaecomastia, agranulocytosis, and anaphylaxis

Dose

- See preparations below

Nifedipine (Non-proprietary) [BNF 61]

- Capsules, nifedipine 5 mg, net price 84-cap pack = £2.97; 10 mg, 84-cap pack = £4.00
- Dose angina prophylaxis (but not recommended, see notes above) and Raynaud’s phenomenon, initially 5 mg 3 times daily, adjusted according to response to 20 mg 3 times daily
- Hypertension, not recommended therefore no dose stated

Adalat® (Bayer Schering) [BNF 61]

- Capsules, orange, nifedipine 5 mg, net price 90-cap pack = £5.73; 10 mg, 90-cap pack = £7.30
- Dose angina prophylaxis (but not recommended, see notes above) and Raynaud’s phenomenon, initially 5 mg 3 times daily, adjusted according to response to max. 20 mg 3 times daily
- Hypertension, not recommended therefore no dose stated

Adalat® LA (Bayer Schering) [BNF 61]

- LA 20 tablets, m/r, f/c, pink, nifedipine 20 mg, net price 28-tab pack = £4.97. Label: 25
- LA 30 tablets, m/r, f/c, pink, nifedipine 30 mg, net price 28-tab pack = £6.85. Label: 25
- LA 60 tablets, m/r, f/c, pink, nifedipine 60 mg, net price 28-tab pack = £9.03. Label: 25
- Counselling Tablett membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy
- Caution dose form not appropriate for use in hepatic impairment or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease
- Dose hypertension, 20–30 mg once daily, increased if necessary to max. 90 mg once daily
- Angina prophylaxis, 30 mg once daily, increased if necessary to max. 90 mg once daily

Adalat® Retard (Bayer Schering) [BNF 61]

- Retard 10 tablets, m/r, f/c, grey-pink, nifedipine 10 mg, net price 56-tab pack = £7.34. Label: 25
- Retard 20 tablets, m/r, f/c, grey-pink, nifedipine 20 mg, net price 56-tab pack = £8.81. Label: 25
- Dose hypertension and angina prophylaxis, 10 mg twice daily, adjusted according to response to 40 mg twice daily

Adipine® MR (Chiesi) [BNF 61]

- Tablets, m/r, nifedipine 10 mg (pink), net price 56-tab pack = £3.73; 20 mg (pink), 56-tab pack = £5.21. Label: 25
- Dose hypertension and angina prophylaxis, 10 mg twice daily, adjusted according to response to 40 mg twice daily

Adipine® XL (Chiesi) [BNF 61]

- Tablets, m/r, red, nifedipine 30 mg, net price 28-tab pack = £4.70; 60 mg, 28-tab pack = £7.10. Label: 25
- Dose hypertension and angina prophylaxis, 30 mg once daily, increased if necessary, max. 90 mg once daily

Coracten SR® (UCB Pharma) [BNF 61]

- Capsules, m/r, nifedipine 10 mg (grey/pink, enclosing yellow pellets), net price 60-cap pack = £3.90; 20 mg (pink/brown, enclosing yellow pellets), 60-cap pack = £5.41. Label: 25
- Dose hypertension and angina prophylaxis, 10 mg twice daily, increased if necessary to max. 40 mg twice daily
Coracens XL® (UCB Pharma) Tablets, m/r, nifedipine 30 mg (brown), net price 28-cap pack = £4.89; 60 mg (orange), 28-cap pack = £7.34. Label: 25 Dose hypertension and angina prophylaxis, 30 mg once daily, increased if necessary; max. 90 mg once daily

Fortipine LA 40® (Goldshield) Tablets, m/r, red, nifedipine 40 mg, net price 30-tab pack = £9.60. Label: 21, 25 Dose hypertension and angina prophylaxis, 40 mg once daily, increased if necessary to 80 mg daily in 1-2 divided doses

Hypolar® Retard 20 (Sandoz) Tablets, m/r, red, f/c, nifedipine 20 mg, net price 56-tab pack = £5.75. Label: 25 Dose hypertension and angina prophylaxis, 20 mg twice daily, increased if necessary to 40 mg twice daily

Nifedipress Tablets, m/r, pink, nifedipine 10 mg, net price 56-tab pack = £9.23; 20 mg, 56-tab pack = £10.06. Label: 25 Dose hypertension and angina prophylaxis, initially 10 mg twice daily adjusted according to response to 40 mg twice daily Note Also available as Calchon® MR, Kentipine® MR

Tensipine MR® (Genus) Tablets, m/r, pink-grey, nifedipine 10 mg, net price 56-tab pack = £4.30; 20 mg, 56-tab pack = £5.49. Label: 21, 25 Dose hypertension and angina prophylaxis, initially 10 mg twice daily adjusted according to response to 40 mg twice daily

Valni XL® (Winthrop) Tablets, m/r, red, nifedipine 30 mg, net price 28-tab pack = £7.29; 60 mg, 28-tab pack = £9.13. Label: 25 Cautions dose form not appropriate for use in hepatic impairment, or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lummen diameter of the gastro-intestinal tract, inflammatory bowel disease, or ileostomy after proctocolectomy. Dose severe hypertension and prophylaxis of angina, 30 mg once daily, increased if necessary to max. 90 mg once daily

With atenolol Section 2.4

**NIMODIPINE**

**Indications** prevention and treatment of ischaemic neurological deficits following aneurysmal subarachnoid haemorrhage

**Cautions** cerebral oedema or severely raised intracranial pressure; hypotension; avoid concomitant administration of nimodipine tablets and infusion, other calcium-channel blockers, or beta-blockers; concomitant nephrotoxic drugs; avoid grapefruit juice (may affect metabolism); interactions: Appendix 1 (calcium-channel blockers)

**Contra-indications** within 1 month of myocardial infarction; unstable angina; acute porphyria (section 9.8.2)

**Hepatic impairment** elimination reduced in cirrhosis—monitor blood pressure

**Renal impairment** manufacturer advises monitor renal function closely with intravenous administration

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk

**Side-effects** hypotension, variation in heart-rate, flushing, headache, gastro-intestinal disorders, nausea, sweating and feeling of warmth; thrombocytopenia and leucopenia reported

---

**VERAPAMIL HYDROCHLORIDE**

**Indications** see under Dose and preparations

**Cautions** first-degree AV block; acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure); patients taking beta-blockers (important: see below); avoid grapefruit juice (may affect metabolism); interactions: Appendix 1 (calcium-channel blockers)

**Contra-indications** hypotension, bradycardia, second- and third-degree AV block; sick sinus syndrome, cardiogenic shock, sino-atrial block; history of heart failure or significantly impaired left ventricular function, even if controlled by therapy; atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome); acute porphyria (section 9.8.2)

**Hepatic impairment** oral dose may need to be reduced

**Pregnancy** may reduce uterine blood flow with fetal hypoxia; manufacturer advises avoid in first trimester unless absolutely necessary; may inhibit labour

**Breast-feeding** amount too small to be harmful

**Side-effects** constipation; less commonly nausea, vomiting, flushing, headache, dizziness, fatigue, anorexia oedema; rarely allergic reactions (erythema, pruritus, urticaria, angioedema, Stevens-Johnson syndrome); myalgia, arthralgia, paraesthesia, erythromelalgia; increased prolactin concentration; rarely gynaecomastia and gingival hyperplasia after long-term treatment; after intravenous administration or high doses, hypotension, heart failure, bradycardia, heart block, and asystole

**Dose**

- By mouth, supraventricular arrhythmias (but see also Contra-indications), 40–120 mg 3 times daily
- Angina, 80–120 mg 3 times daily
- Hypertension, 240–480 mg daily in 2–3 divided doses
2.6.3 Other antianginal drugs

Prophylaxis of cluster headache [unlicensed] (under specialist supervision), 240–960 mg daily in 3–4 divided doses

- By slow intravenous injection over 2 minutes (3 minutes in elderly), supraventricular arrhythmias (but see also Contra-indications), 5–10 mg (preferably with ECG monitoring); in paroxysmal tachyarrhythmias a further 5 mg after 5–10 minutes if required

Verapamil (Non-proprietary) (Abbott)
Tablets, coated, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.55; 80 mg, 84-tab pack = £1.91; 120 mg, 28-tab pack = £1.54; 160 mg, 56-tab pack = £2.80
Oral solution, verapamil hydrochloride 40 mg/5 mL, net price 150 mL = £36.90
Brands include Zolvent®

Cordilox® (Dexcel) (Abbott)
Tablets, yellow, f/c, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.50; 80 mg, 84-tab pack = £2.05; 120 mg, 28-tab pack = £1.15; 160 mg, 56-tab pack = £2.80
Injection, verapamil hydrochloride 2.5 mg/mL, net price 2-mL amp = £1.08
Brands include

Securon® (Abbott) (Chiesi)
Tablets, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £5.00. Label: 25
Dose see Securon®

Securon SR® (Abbott) (Chiesi)
Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £5.00. Label: 25
Dose hypertension, 240 mg daily (new patients initially 120 mg), increased if necessary to max. 480 mg daily (doses above 240 mg daily as 2 divided doses)
Angina, 240 mg twice daily (may sometimes be reduced to once daily)
Prophylaxis after myocardial infarction where beta-blockers not appropriate (started at least 1 week after infarction), 360 mg daily, max. 480 mg daily
Univer® (Cephalon) (Abbott)
Capsules, m/r, verapamil hydrochloride 120 mg (yellow/dark blue), net price 28-cap pack = £4.86; 180 mg (yellow), 56-cap pack = £11.38; 240 mg (yellow/dark blue), 28-cap pack = £7.87. Label: 25
Dose hypertension, 240 mg daily, max. 480 mg daily (new patients, initial dose 120 mg). Angina, 360 mg daily, max. 480 mg daily
Verapress MR® (Dexcel) (Abbott)
Tablets, m/r, pale green, f/c, verapamil hydrochloride 240 mg, net price 28-tab pack = £6.04. Label: 25
Dose hypertension, 1 tablet daily, increased to twice daily if necessary. angina, 1 tablet twice daily (may be reduced to once daily)
Note Also available as Cordilox®
Vertab® SR 240 (Chiesi) (Abbott)
Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £5.45. Label: 25
Dose mild to moderate hypertension, 240 mg daily, increased to twice daily if necessary. angina, 240 mg twice daily (may sometimes be reduced to once daily)

2.6.3 Other antianginal drugs

Nicorandil, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina (section 2.10.1). Nicorandil has similar efficacy to other antianginal drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antianginal drugs [unlicensed indication].

Ivabradine lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients in normal sinus rhythm in combination with a beta-blocker, or when beta-blockers are contra-indicated or not tolerated.

Ranolazine is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antianginal drugs.

Ivabradine

Indications treatment of angina in patients in normal sinus rhythm (see notes above)
Caution mild heart failure including asymptomatic left ventricular dysfunction; monitor for atrial fibrillation or other arrhythmias (treatment ineffective); hypotension (avoid if severe); retinitis pigmentosa; elderly; interactions Appendix 1 (ivabradine)
Contra-indications severe bradycardia (not to be initiated if heart rate below 60 beats per minute); cardiogenic shock; acute myocadial infarction; immediately after cerebrovascular accident; sick-sinus syndrome; sino-atrial block; moderate to severe heart failure; patients with pacemaker; unstable angina; second- and third-degree heart block; congenital QT syndrome
Hepatic impairment manufacturer advises caution in moderate impairment; avoid in severe impairment
Renal impairment manufacturer advises use with caution if eGFR less than 15 mL/minute/1.73 m²—no information available
Pregnancy manufacturer advises avoid—xicity in animal studies
Breast-feeding present in milk in animal studies—manufacturer advises avoid
Side-effects bradycardia, first-degree heart block, ventricular extrasystoles; headache, dizziness; visual disturbances including phosphenes and blurred vision; less common nausea, constipation, diarrhoea, palpitations, supraventricular extrasystoles, dyspnoea, vertigo, muscle cramps, eosinophilia, hyperuricaemia, and raised plasma-creatinine concentration
Dose
- Initially 5 mg twice daily, increased if necessary after 3–4 weeks to 7.5 mg twice daily (if not tolerated reduce dose to 2.5–5 mg twice daily); ELDERLY initially 2.5 mg twice daily
- Note Ventricular rate at rest should not be allowed to fall below 50 beats per minute

Procoralan® (Servier) (Abbott)
Tablets, pink, f/c, ivabradine (as hydrochloride) 5 mg (scored), net price 56-tab pack = £39.00; 7.5 mg, 56-tab pack = £39.00

ELDERLY
**NICORANDIL**

**Indications**  prophylaxis and treatment of angina

**Cautions** hypovolaemia; low systolic blood pressure; acute pulmonary oedema; acute myocardial infarction with acute left ventricular failure and low filling pressures; **interactions:** Appendix 1 (nicorandil)

**Driving** Patients should be warned not to drive or operate machinery until it is established that their performance is unimpaired.

**Contra-indications** cardiogenic shock; left ventricular failure with low filling pressures; hypotension

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** no information available—manufacturer advises avoid

**Side-effects** headache (especially on initiation, usually transitory); cutaneous vasodilatation with flushing; nausea, vomiting, dizziness, weakness also reported; rarely oral ulceration, royalgia, and rash; at high dosage, reduction in blood pressure and/or increase in heart rate; angioedema, hepatic dysfunction, and anal ulceration also reported.

**Dose**
- Initially 10 mg twice daily (if susceptible to headache)
- usual dose 10–20 mg twice daily; up to 30 mg twice daily may be used

**Ikorel®** (Sanofi-Aventis)  Tablets, scored, nicorandil 10 mg, net price 60-tab pack = £7.71; 20 mg, 60-tab pack = £14.64

**RANOLAZINE**

**Indications** as adjunctive therapy in the treatment of stable angina in patients inadequately controlled or intolerant of first-line antianginal therapies

**Cautions** moderate to severe congestive heart failure; QT interval prolongation; elderly; body-weight less than 60 kg; **interactions:** Appendix 1 (ranolazine)

**Hepatic impairment** use with caution in mild impairment; avoid in moderate and severe impairment

**Renal impairment** use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Driving** no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** constipation, nausea, vomiting; dizziness, headache, asthenia; less commonly abdominal pain, weight loss, dry mouth, dyspepsia, flatulence; hot flush, hypotension, syncope, prolonged QT interval, peripheral oedema; dyspnoea, cough, epistaxis; lethargy, hypoesthesia, drowsiness, tremor, anxiety, insomnia, anorexia; dysuria, haematuria, chromaturia; dehydration; pain in extremities, muscle cramp, joint swelling; visual disturbance; tinnitus; pruritus, sweating; rarely pancreatitis, erosive duodenitis; cold extremities; throat tightness; amnesia, loss of consciousness, disorientation; erectile dysfunction; parosmia, impaired hearing; allergic dermatitis, urticaria, rash

**Dose**
- **ADULT** over 18 years, initially 375 mg twice daily, increased after 2–4 weeks to 500 mg twice daily and then adjusted according to response to max. 750 mg twice daily (reduce dose to 375–500 mg twice daily if not tolerated)

**Ranexa®** (Menarini)  Tablets, m/r, ranolazine 375 mg (blue), net price 60-tab pack = £48.98; 500 mg (orange), 60-tab pack = £48.98; 750 mg (green), 60-tab pack = £48.98. Label: 25, patient alert card

**2.6.4 Peripheral vasodilators and related drugs**

Peripheral vascular disease can be either occlusive (e.g. *intermittent claudication*) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. *Raynaud’s syndrome*).

Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as smoking cessation (section 4.10.2), effective control of blood pressure (section 2.5), regulating blood lipids (section 2.12), optimising glycaemic control in diabetes (section 6.1), taking aspirin in a dose of 75 mg daily (section 2.9), and possibly weight reduction in obesity (section 4.5). Exercise training, treatment with cilostazol or naftidrofuryl (see below), and possibly statin therapy can improve symptoms of intermittent claudication.

Cilostazol is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest. Patients receiving cilostazol should be assessed for improvement after 3 months. The *Scottish Medicines Consortium* (p. 4) has advised (October 2005) that cilostazol is not recommended for the treatment of intermittent claudication within NHS Scotland.

Naftidrofuryl can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl should be assessed for improvement after 3–6 months. Inositol nicotinate, pentoxifylline, and cinnarizine are not established as being effective for the treatment of intermittent claudication.

Management of *Raynaud’s syndrome* includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud’s syndrome. Nifedipine (section 2.6.2) is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, naftidrofuryl may produce symptomatic improvement; inositol nicotinate (a nicotinic acid derivative) may also be considered. Cinnarizine, pentoxifylline, prazosin, and moxisylyte are not established as being effective for the treatment of Raynaud’s syndrome.

Vasodilator therapy is not established as being effective for chilblains (section 13.13).

**CILOSTAZOL**

**Indications** intermittent claudication in patients without rest pain and no peripheral tissue necrosis

**Cautions** atrial or ventricular ectopy, atrial fibrillation, atrial flutter; diabetes mellitus (higher risk of intraocular bleeding); concomitant drugs that increase risk of bleeding; **interactions:** Appendix 1 (cilostazol)

**Contra-indications** predisposition to bleeding (e.g. active peptic ulcer, haemorrhagic stroke in previous 6 months, surgery in previous 3 months, proliferative diabetic retinopathy, poorly controlled hypertension)
136 2.6.4 Peripheral vasodilators and related drugs BNF 61

history of ventricular tachycardia, of ventricular fibrillation and of multifocal ventricular ectopics, prolongation of QT interval, congestive heart failure

**Hepatic impairment** avoid in moderate or severe liver disease

**Renal impairment** avoid if eGFR less than 25 mL/minute/1.73 m²

**Pregnancy** avoid—xicity in animal studies

**Breast-feeding** present in milk in animal studies—manufacturer advises avoid

**Side-effects** gastro-intestinal disturbances; tachycardia, palpitation, angina, arrhythmia, chest pain, oedema; rhinitis; dizziness, headache; asthenia; rash; pruritus, ecchymosis; less commonly gastritis, congestive heart failure, postural hypotension, dyspnoea, pneumonia, cough, insomnia, abnormal dreams, anxiety, hyperglycaemia, diabetes mellitus, anaemia, haemorrhage, myalgia, hypersensitivity reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis in rare cases); rarely anorexia, hypertension, paresis, increased urinary frequency, bleeding disorders, renal impairment, conjunctivitis, tinnitus, and jaundice

**Dose**

- 100 mg twice daily (30 minutes before or 2 hours after food)

**Pletal®** (Otsuka)

- Tablets, cilostazol 50 mg, net price 56-tab pack = £35.31; 100 mg, 56-tab pack = £35.31

**INOSITOL NICOTINATE**

**Indications** peripheral vascular disease; hyperlipidaemia (section 2.12)

**Cautions** cerebrovascular insufficiency, unstable angina

**Contra-indications** recent myocardial infarction, acute phase of a cerebrovascular accident

**Pregnancy** no information available—manufacturer advises avoid

**Side-effects** nausea, vomiting, hypotension, flushing, syncope, oedema, headache, dizziness, paraesthesia, rash

**Dose**

- 3 g daily in 2–3 divided doses; max. 4 g daily

**Hexopal®** (Genus)

- Tablets, scored, inositol nicotinate 500 mg, net price 100 = £30.76
- Tablets forte, scored, inositol nicotinate 750 mg, net price 112-tab pack = £51.03

**MOXISLYTE**

**Indications** primary Raynaud’s syndrome (short-term treatment)

**Cautions** diabetes mellitus

**Contra-indications** active liver disease

**Pregnancy** manufacturer advises avoid

**Side-effects** nausea, diarrhoea, flushing, headache, dizziness; hepatic reactions including cholestatic jaundice and hepatitis reported to CSM

**Dose**

- Initially 40 mg 4 times daily, increased to 80 mg 4 times daily if poor initial response; discontinue after 2 weeks if no response

**Opilon®** (Archimedes)

- Tablets, yellow, Film, moxisylyte 40 mg (as hydrochloride), net price 112-tab pack = £75.18. Label: 21

**NAFTIDROFURYL OXALATE**

**Indications** see under Dose

**Side-effects** nausea, epigastric pain, rash, hepatitis, hepatic failure

**Dose**

- Peripheral vascular disease (see notes above), 100–200 mg 3 times daily
- Cerebral vascular disease, 100 mg 3 times daily

**Nafidrofuryl** (Non-proprietary)

- Capsules, nafidrofuryl oxalate 100 mg, net price 84-cap pack = £4.52. Label: 25, 27

**Praxilene®** (Merck Serono)

- Capsules, pink, nafidrofuryl oxalate 100 mg, net price 84-cap pack = £8.10. Label: 25, 27

**PENTOXIFYLLINE**

**Indications** peripheral vascular disease; venous leg ulcers [unlicensed indication] (Appendix A8.2.5)

**Cautions** hypotension, coronary artery disease; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (pentoxifylline)

**Contra-indications** cerebral haemorrhage, extensive retinal haemorrhage, acute myocardial infarction

**Hepatic impairment** manufacturer advises reduce dose in severe impairment

**Renal impairment** reduce dose by 30–50% if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** present in milk—manufacturer advises use only if potential benefit outweighs risk

**Side-effects** gastro-intestinal disturbances, dizziness, agitation, sleep disturbances, headache; rarely flushing, tachycardia, angina, hypotension, thrombocytopenia, intrahepatic cholestasis, hypersensitivity reactions including rash, pruritus and bronchospasm

**Dose**

- 400 mg 2–3 times daily

**Trental®** (Sanofi-Aventis)

- Tablets, m/r, pink, s/c, pentoxifylline 400 mg, net price 90-tab pack = £19.68. Label: 21, 25

**Other preparations used in peripheral vascular disease**

Rutosides (oxerutins, Paroven®) are not vasodilators and are not generally regarded as effective preparations as capillary sealants or for the treatment of cramps; side-effects include headache, flushing, rashes, mild gastro-intestinal disturbances.

**Paroven®** (Novartis Consumer Health)

- Capsules, yellow, oxerutins 250 mg, net price 120-cap pack = £13.05
- Capsules, yellow, oxerutins 250 mg, net price 120-cap pack = £13.05

**Dose** relief of symptoms of oedema associated with chronic venous insufficiency, 500 mg twice daily
2.7 Sympathomimetics

2.7.1 Inotropic sympathomimetics

The cardiac stimulants dobutamine and dopamine act on alpha, receptors in cardiac muscle, and increase contractility with little effect on rate.

Dopexamine acts on beta, receptors in cardiac muscle to produce its positive inotropic effect; and on peripheral dopamine receptors to increase renal perfusion; it is reported not to induce vasoconstriction.

Isoprenaline injection is available from ‘special-order’ manufacturers or specialist importing companies, see p. 988.

Shock. Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline (epinephrine), dobutamine or dopamine (see notes above). In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline (nor-epinephrine) (section 2.7.2) may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

For advice on the management of anaphylactic shock, see section 3.4.3.

DOBUTAMINE

Indications inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, and cardiogenic shock; cardiac stress testing (consult product literature)

Cautions arrhythmias, acute myocardial infarction, acute heart failure, severe hypotension, marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis); correct hypovolaemia before starting treatment; tolerance may develop with continuous infusions longer than 72 hours; hyperthyroidism; interactions: Appendix 1 (sympathomimetics)

Contra-indications phaeochromocytoma

Pregnancy no evidence of harm in animal studies—manufacturers advise use only if potential benefit outweighs risk

Breast-feeding manufacturers advise avoid—no information available

Side-effects nausea; hypotension, hypertension (marked increase in systolic blood pressure indicates overdose), arrhythmias, palpitations, chest pain; dyspnoea, bronchospasm; headache; fever; increased urinary urgency; eosinophilia; rash, phlebitis; very rarely myocardial infarction, hypokalaemia; coronary artery spasm and thrombocytopenia also reported

Dose

• By intravenous infusion, 2.5–10 micrograms/kg/minute, adjusted according to response

Dobutamine (Non-proprietary) injection, dobutamine (as hydrochloride) 5 mg/mL. To be diluted before use or given undiluted with syringe pump. Net price 50-mL vial = £7.50 Excipients may include sulphites

Concentrate for intravenous infusion, dobutamine (as hydrochloride) 12.5 mg/mL. To be diluted before use. Net price 20-mL amp = £5.20 Excipients may include sulphites

DOPAMINE HYDROCHLORIDE

Indications cardiogenic shock in infarction or cardiac surgery

Cautions correct hypovolaemia; low dose in shock due to acute myocardial infarction—see notes above; hyperthyroidism; interactions: Appendix 1 (sympathomimetics)

Contra-indications tachyarrhythmia, phaeochromocytoma

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Side-effects nausea and vomiting, peripheral vasoconstriction, hypotension, hypertension, tachycardia

Dose

• By intravenous infusion, 2–5 micrograms/kg/minute initially (see notes above)

Dopamine (Non-proprietary) injection, dopamine hydrochloride 40 mg/mL, net price 5-mL amp = 90p; 160 mg/mL, 5-mL amp = £3.40. To be diluted before use

Concentrate for intravenous infusion, dopamine hydrochloride 1.6 mg/mL in glucose 5% intravenous infusion, net price 250-mL container (400 mg) = £11.69. Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

DOPEXAMINE HYDROCHLORIDE

Indications inotropic support and vasodilator in exacerbations of chronic heart failure and in heart failure associated with cardiac surgery

Cautions myocardial infarction, recent angina, hypokalaemia, hyperglycaemia; correct hypovolaemia before starting and during treatment, monitor blood pressure, pulse, plasma potassium, and blood glucose; hyperthyroidism; avoid abrupt withdrawal; interactions: Appendix 1 (sympathomimetics)
2.7.2 Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed (see also section 2.7.1).

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathethic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen (section 3.6), elevation of the legs, and injection of a pressor drug such as ephedrine. As well as constricting peripheral vessels ephedrine also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine to manage associated bradycardia (although intravenous injection of atropine sulphate 400 to 600 micrograms may also be required if bradycardia persists).

### Ephedrine Hydrochloride

**Contra-indications** Left ventricular outlet obstruction such as hypertrophic cardiomyopathy or aortic stenosis; phaeochromocytoma, thrombocytopenia

**Pregnancy** No information available—manufacturer advises avoid

**Side-effects** Nausea, vomiting; tachycardia, bradycardia, arrhythmias, angina, myocardial infarction, tremor, headache; dyspnœa; reversible thrombocytopenia; sweating

**Dose**
- **By intravenous infusion** into central or large peripheral vein, 500 nanograms/kg/minute, may be increased up to 1 microgram/kg/minute and further increased up to 6 micrograms/kg/minute in increments of 0.5–1 microgram/kg/minute at intervals of not less than 15 minutes

**Dopacard** (Cephalon) Concentrate for intravenous infusion, dopexamine hydrochloride 10 mg/mL (1%). To be diluted before use. Net price 5-mL amp = £19.80

**Note** Contact with metal in infusion apparatus should be minimised

**Indications** Acute hypotension (see notes above); priapism (section 7.4.5) [unlicensed indication]

**Cautions** See under Noradrenaline Acid Tartrate; longer duration of action than noradrenaline (norepinephrine), see below; cirrhosis

**Hypertensive response** Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure

**Contra-indications** See under Noradrenaline Acid Tartrate

**Pregnancy** May reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** Manufacturer advises caution—no information available

**Side-effects** See under Noradrenaline Acid Tartrate; tachycardia; fatal ventricular arrhythmia reported in Laennec’s cirrhosis

**Dose**
- **By intravenous infusion**, 15–100 mg, adjusted according to response
- **In emergency, by intravenous injection**, 0.5–5 mg then by intravenous infusion, 10–150 mg, adjusted according to response

**Metaraminol** (Non-proprietary) Injection, metaraminol 10 mg (as tartrate)/mL Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

**Indications** See under dose

**Cautions** Coronary, mesenteric, or peripheral vascular thrombosis; following myocardial infarction, Prinzmetal’s variant angina, hyperthyroidism, diabetes mellitus; hypoxia or hypercapnia; uncorrected hypovolaemia; elderly; extravasation at injection site may cause necrosis; interactions: Appendix 1 (sympathomimetics)

**Contra-indications** Hypertension (monitor blood pressure and rate of flow frequently); pregnancy Avoid—may reduce placental perfusion

**Side-effects** Hypertension, headache, bradycardia, arrhythmias, peripheral ischaemia

**Dose**
- **Acute hypotension, by intravenous infusion**, via central venous catheter, of a solution containing noradrenaline acid tartrate 80 micrograms/mL (equivalent to noradrenaline base 40 micrograms/mL) at an initial rate of 0.16–0.33 mL/minute, adjusted according to response
● Cardiac arrest, by rapid intravenous or intracardiac injection, 0.5–0.75 mL of a solution containing noradrenaline acid tartrate 200 micrograms/mL (equivalent to noradrenaline base 100 micrograms/mL)

Noradrenaline/Norepinephrine (Non-proprietary)
Injection, noradrenaline acid tartrate 2 mg/mL (equivalent to noradrenaline base 1 mg/mL). For dilution before use. Net price 2-mL amp. = £2.40, 4-mL amp. = £4.40, 20-mL amp. = £6.35

PHENYLEPHRINE HYDROCHLORIDE

Indications acute hypotension (see notes above); priapism (section 7.4.5) [unlicensed indication]
Cautions see under Noradrenaline Acid Tartrate; longer duration of action than noradrenaline (norepinephrine), see below; coronary disease
Hypertensive response Phenylephrine has a longer duration of action than noradrenaline, and an excessive vasoconstrictor response may cause a prolonged rise in blood pressure
Contra-indications see under Noradrenaline Acid Tartrate; severe hyperthyroidism

Pregnancy avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradyarrhythmia reported in late pregnancy and labour

Side-effects see under Noradrenaline Acid Tartrate; tachycardia or reflex bradycardia

Dose

● By subcutaneous or intramuscular injection, 2–5 mg, followed if necessary by further doses of 1–10 mg

● By slow intravenous injection of a 1 mg/mL solution, 100–500 micrograms repeated as necessary after at least 15 minutes

● By intravenous infusion, initial rate up to 180 micrograms/minute reduced to 30–60 micrograms/minute according to response

Phenylephrine (Sovereign)
Injection, phenylephrine hydrochloride 10 mg/mL (1%), net price 1-mL amp. = £5.50

2.7.3 Cardiopulmonary resuscitation

The algorithm for cardiopulmonary resuscitation (see inside back cover) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at www.resus.org.uk.

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline (epinephrine) 1 in 10 000 (100 micrograms/mL) is recommended in a dose of 1 mg (10 mL) by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL. Sodium Chloride 0.9% injection to aid entry into the central circulation. Intravenous injection of amiodarone 300 mg (from a prefilled syringe or diluted in 20 mL). Glucose 5% should be considered after adrenaline to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone 150 mg can be given by intravenous injection if necessary, followed by an intravenous infusion of amiodarone 900 mg over 24 hours. Lidocaine, in a dose of 1 mg/kg, is an alternative if amiodarone is not available; a total dose of 3 mg/kg lidocaine should not be exceeded during the first hour. Atropine is no longer recommended in the treatment of asystole or pulseless electrical activity.

During cardiopulmonary arrest if intravenous access cannot be obtained, the intravenous route can be used instead. Drug administration via the endotracheal route is no longer recommended.

For the management of acute anaphylaxis see section 3.4.3.

ADRENALINE/EPINEPHRINE

Indications see notes above
Cautions ischaemic heart disease, severe angina, obstructive cardiomyopathy, hypertension, arrhythmias, cerebrovascular disease, occlusive vascular disease, arteriosclerosis, monitor blood pressure and ECG; cor pulmonale; organic brain damage, psychoneurosis; diabetes mellitus, hyperthyroidism, phaeochromocytoma; prostate disorders; hypokalaemia, hypercalcaemia; susceptibility to angle-closure glaucoma; elderly, interactions: Appendix 1 (sympathomimetics)

Renal impairment manufacturers advise use with caution in severe impairment

Pregnancy may reduce placental perfusion and can delay second stage of labour; manufacturers advise use only if benefit outweighs risk

Breast-feeding present in milk but unlikely to be harmful as poor oral bioavailability

Side-effects nausea, vomiting, dry mouth, hypersalivation; arrhythmias, syncope, angina, pallor, palpitation, cold extremities, hypertension (risk of cerebral haemorrhage); dyspnoea, pulmonary oedema (on excessive dosage or extreme sensitivity); anxiety, tremor, restlessness, headache, weakness, dizziness, hallucinations; hyperglycaemia; urinary retention, difficulty in micturition; metabolic acidosis; hypokalaemia; tissue necrosis at injection site and of extremities, liver and kidneys; mydriasis, angle-closure glaucoma, and sweating

Dose

● See notes above

Adrenaline/Epinephrine 1 in 10 000, Dilute (Non-proprietary) Injection, adrenaline (as acid tartrate) 100 micrograms/mL. 10-mL amp.

Brands include Minjet® Adrenaline

2.8 Anticoagulants and protamine

2.8.1 Parenteral anticoagulants

2.8.2 Oral anticoagulants

2.8.3 Protamine sulphate

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the
anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin. For the uses of anticoagulants see Parenteral anticoagulants, below and Oral anticoagulants, p. 146

Venous thromboembolism
Venous thromboembolism includes deep-vein thrombosis and pulmonary embolism, and occurs as a result of thrombus formation in a vein.

Prophylaxis of venous thromboembolism
All patients admitted to hospital should undergo a risk assessment for venous thromboembolism on admission. Patients considered to be at high risk include those anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism, thrombophilic disorder, or patients over 60 years. Patients with risk factors for bleeding (e.g. acute stroke, thrombocytopenia, acquired or untreated inherited bleeding disorders) should only receive pharmacological prophylaxis when the risk of bleeding does not outweigh the risk of venous thromboembolism. A NICE Guideline provides a full list of risk factors, and gives recommendations for prophylaxis. A venous thromboembolism risk assessment checklist is also available from the Department of Health (www.dh.gov.uk).

Patients scheduled for surgery should be offered mechanical prophylaxis (e.g. anti-embolism stockings) on admission if appropriate; prophylaxis should continue until the patient is sufficiently mobile. Choice of mechanical prophylaxis will depend on factors such as the type of surgery, suitability for the patient, and their condition.

Patients undergoing general or orthopaedic surgery, who are considered to be at high risk of venous thromboembolism (see above), should be offered pharmacological prophylaxis. Choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy. A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; unfractionated heparin is preferred for patients in renal failure. Fondaparinux is an option for patients undergoing hip or knee replacement surgery, hip fracture surgery, gastrointestinal, bariatric, or day surgery procedures. The oral anticoagulants dabigatran etexilate and rivaroxaban are indicated for thromboprophylaxis following hip or knee replacement surgery, hip fracture surgery, gastrointestinal, bariatric, or day surgery procedures. The oral anticoagulants dabigatran etexilate and rivaroxaban are indicated for thromboprophylaxis following hip or knee replacement surgery, hip fracture surgery, gastrointestinal, bariatric, or day surgery procedures. The oral anticoagulants dabigatran etexilate and rivaroxaban are indicated for thromboprophylaxis following hip or knee replacement surgery, hip fracture surgery, gastrointestinal, bariatric, or day surgery procedures. The oral anticoagulants dabigatran etexilate and rivaroxaban are indicated for thromboprophylaxis following hip or knee replacement surgery, hip fracture surgery, gastrointestinal, bariatric, or day surgery procedures. The oral anticoagulants dabigatran etexilate and rivaroxaban are indicated for thromboprophylaxis following hip or knee replacement surgery, hip fracture surgery, gastrointestinal, bariatric, or day surgery procedures. The oral anticoagulants dabigatran etexilate and rivaroxaban are indicated for thromboprophylaxis following hip or knee replacement surgery, hip fracture surgery, gastrointestinal, bariatric, or day surgery procedures. The oral anticoagulants dabigatran etexilate and rivaroxaban are indicated for thromboprophylaxis following hip or knee replacement surgery, hip fracture surgery, gastrointestinal, bariatric, or day surgery procedures.

Thrombus consists of a fibrin web enmeshed with platelets and red cells.

Medical condition, suitability for the patient, and local policy. Patients should receive either a low molecular weight heparin, unfractionated heparin (if patient in renal failure), or fondaparinux. Prophylaxis should continue until the patient is no longer considered to be at significant risk of venous thromboembolism. Mechanical prophylaxis (e.g. anti-embolism stockings) can be offered to medical patients in whom pharmacological prophylaxis is contra-indicated, and continued until the patient is sufficiently mobile.

Heparin
Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as ‘standard’ or ‘unfractionated heparin’ to distinguish it from the low molecular weight heparins (see p. 141), which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, unfractionated heparin can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Treatment For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, unfractionated heparin is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or by intermittent subcutaneous injection. Intermittent intravenous injection of unfractionated heparin is no longer recommended. An oral anticoagulant (usually warfarin, section 2.8.2) is started at the same time as unfractionated or low molecular weight heparin (the heparin needs to be continued for at least 5 days and until the INR has been in the therapeutic range for 2 consecutive days). Laboratory monitoring for unfractionated heparin, preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure (for unfractionated heparin). A low molecular weight heparin or, in some circumstances, unfractionated heparin is also used in regimens for the management of myocardial infarction and unstable angina (section 2.10.1).

Prophylaxis For details on the use of heparins in the prophylaxis of venous thromboembolism see section 2.8.

Pregnancy Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin, enoxaparin, and tinzaparin; see also under individual drugs. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits Unfractionated heparin is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.
Haemorrhage  If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulphate (section 2.8.3) is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

HEPARIN

Indications see under Dose

Cautions see notes above; also elderly; concomitant use of drugs that increase risk of bleeding; interactions: Appendix 1 (heparin).

Heparin-induced thrombocytopenia  Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis. Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts is recommended if given for longer than 4 days. Signs of heparin-induced thrombocytopenia include a 50% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as lepirudin or danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Hyperkalaemia  Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy, and plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

Contra-indications  haemophilia and other haemorrhagic disorders, thrombocytopenia (including history of heparin-induced thrombocytopenia), recent cerebral haemorrhage, severe hypertension; peptic ulcer; after major trauma or recent surgery to eye or nervous system; acute bacterial endocarditis; spinal or cerebrovascular arterial occlusion, followed by intravenous injection, loading dose of 5000 units or 75 units/kg (10 000 units in severe pulmonary embolism), followed by continuous intravenous infusion of 18 units/kg/hour or treatment of deep-vein thrombosis, by subcutaneous injection of 15 000 units every 12 hours (laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly); CHLD under 18 years see BNF for Children.

● Prophylaxis in surgery (see also notes above), by subcutaneous injection, 5000 units 2 hours before surgery, then every 8–12 hours (monitoring not needed); during pregnancy (with monitoring), 5000–10 000 units every 12 hours (important; prevention of prosthetic heart-valve thrombosis in pregnancy calls for specialist management).

● Haemodialysis by intravenous injection initially 1000–5000 units, followed by continuous intravenous infusion of 250–1000 units/hour.

● Prevention of clotting in extracorporeal circuits, consult product literature.

Doses above reflect the guidelines of the British Society for Haematology; for doses of the low molecular weight heparins, see below.

Heparin Sodium (Non-proprietary) Heparin calcium Injection, heparin sodium 1000 units/mL, net price 1-mL amp = £0.99, 5-mL amp = £2.50, 5-mL vial = £2.50, 10-mL amp = £4.31, 20-mL amp = £7.09, 5000 units/mL, 1-mL amp = £1.94, 5-mL amp = £5.06, 5-mL vial = £5.64; 25 000 units/mL, 0.2-mL amp = £2.49, 1-mL amp = £5.13, 5-mL vial = £11.11.

Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 2).

Heparin Calcium (Non-proprietary) Heparin calcium Injection, heparin calcium 25 000 units/mL, net price 0.2-mL amp = £2.61.

Low molecular weight heparins

Low molecular weight heparins (bemiparin, dalteparin, enoxaparin, and tinzaparin) are usually preferred over unfractionated heparin in the prevention of venous thromboembolism because they are as effective and they have a lower risk of heparin-induced thrombocytopenia; see Prophylaxis of Venous Thromboembolism, p. 140. The standard prophylactic regimen does not require monitoring. The duration of action of low molecular weight heparins is longer than that of unfractionated heparin and once-daily subcutaneous administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are also used in the treatment of deep-vein thrombosis, pulmonary embolism (see also Treatment, above), myocardial infarction (section 2.10.1), unstable coronary artery disease (section 2.10.1) and for the prevention of clotting in extracorporeal circuits.

Dalteparin is also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months.

Routine monitoring of anti-Factor Xa activity is not usually required during treatment with low molecular weight heparins, but may be necessary in patients at
increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

Haemorrhage  See under Heparin.

Pregnancy  See under Heparin.

BEMIPARIN SODIUM

Indications  see notes above and under preparations

Cautions  see under Heparin and notes above

Contra-indications  see under Heparin

Hepatic impairment  manufacturer advises use with caution and avoid in severe impairment

Renal impairment  risk of bleeding may be increased—use with caution; monitoring of anti-Factor Xa may be required; use of unfractionated heparin may be preferable

Pregnancy  manufacturer advises avoid unless essential—no information available; see also Pregnancy, p. 140

Breast-feeding  manufacturer advises avoid—no information available

Side-effects  see under Heparin

Dose

•  See under preparations below

Zibor® (Archimedes) ▼ (BN)
Injection, bemiparin sodium 12 500 units/mL, net price 2500-unit (0.2-mL) prefilled syringe = £1.86; 17 500 units/mL, 3500-unit (0.2-mL) prefilled syringe = £2.75

Dose  prophylaxis of deep-vein thrombosis, by subcutaneous injection, moderate risk, 2500 units 2 hours before or 6 hours after surgery then 2500 units every 24 hours; high risk, 3500 units 2 hours before or 6 hours after surgery then 3500 units every 24 hours

Prevention of clotting in extracorporeal circuits, consult product literature

Injection, bemiparin sodium 25 000 units/mL, net price 0.2-mL (5000-unit) prefilled syringe = £4.22, 0.3-mL (7500-unit) prefilled syringe = £5.34, 0.4-mL (10 000-unit) prefilled syringe = £4.59

Dose  treatment of deep-vein thrombosis (with or without pulmonary embolism), by subcutaneous injection, 115 units/kg every 24 hours until adequate oral anticoagulation established

DALTEPARIN SODIUM

Indications  see notes above and under preparations

Cautions  see under Heparin and notes above

Contra-indications  see under Heparin

Hepatic impairment  dose reduction may be required in severe impairment

Renal impairment  risk of bleeding may be increased—dose reduction, and monitoring of anti-Factor Xa may be required; use of unfractionated heparin may be preferable

Pregnancy  not known to be harmful; multidose vial contains benzyl alcohol—manufacturer advises avoid; see also Pregnancy, p. 140

Breast-feeding  no information available

Side-effects  see under Heparin

Dose

•  See under preparations below

Fragmin® (Pharmacia) ▼ (BN)
Injection (single-dose syringe), dalteparin sodium 12 500 units/mL, net price 2500-unit (0.2-mL) syringe = £1.86; 25 000 units/mL, 5000-unit (0.2-mL) syringe = £2.82, 7500-unit (0.3-mL) syringe = £4.23, 10 000-unit (0.4-mL) syringe = £5.65, 12 500-unit (0.5-mL) syringe = £7.06, 15 000-unit (0.6-mL) syringe = £8.47, 18 000-unit (0.72-mL) syringe = £10.16

Dose  prophylaxis of deep-vein thrombosis, in surgical patients, by subcutaneous injection, moderate risk, 2500 units 1–2 hours before surgery then 2500 units every 24 hours; high risk, 2500 units 1–2 hours before surgery, then 2500 units 8–12 hours later (or 5000 units on the evening before surgery, then 5000 units on the following evening), then 5000 units every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients, by subcutaneous injection, 5000 units every 24 hours

Treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, as a single daily dose, ADULT body-weight under 46 kg, 7500 units daily; body-weight 46–56 kg, 10 000 units daily; body-weight 57–68 kg, 12 500 units daily; body-weight 69–82 kg, 15 000 units daily; body-weight 83 kg and over, 18 000 units daily, with oral anticoagulant treatment until adequate oral anticoagulation established; monitoring of anti-Factor Xa not usually required; for patients at increased risk of haemorrhage, see below

Treatment of venous thromboembolism in pregnancy (unlicensed indication), by subcutaneous injection, early pregnancy body-weight under 50 kg, 5000 units twice daily; body-weight 50–70 kg, 6000 units twice daily; body-weight 70–90 kg, 8000 units twice daily; body-weight over 90 kg, 10 000 units twice daily

Extended treatment and prophylaxis of venous thromboembolism in patients with solid tumors, by subcutaneous injection, once daily for 30 days, ADULT body-weight 40–45 kg, 7500 units daily; body-weight 46–56 kg, 10 000 units daily; body-weight 57–68 kg, 12 500 units daily; body-weight 69–82 kg, 15 000 units daily; body-weight 83 kg and over, 18 000 units daily; then once daily for a further 5 months, by subcutaneous injection, ADULT body-weight 40–56 kg, 7500 units daily; body-weight 57–68 kg, 10 000 units daily; body-weight 69–82 kg, 12 500 units daily; body-weight 83–98 kg, 15 000 units daily; body-weight 99 kg and over, 18 000 units daily; interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

Injection, dalteparin sodium 2500 units/mL (for subcutaneous or intravenous use), net price 4-mL (10 000-unit) amp = £5.12; 10 000-units/mL (for subcutaneous or intravenous use), 1-mL (10 000-unit) amp = £5.12, 25 000 units/mL (for subcutaneous use only), 4-mL (100 000-unit) vial = £48.66

Exipients include benzyl alcohol (to 100 000-unit/4-mL multidose vial) (avoid in neonates, see Excipients, p. 2)

Dose  treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, 200 units/kg (max. 10 000 units) as a single daily dose (or 100 units/kg twice daily if increased risk of haemorrhage) until adequate oral anticoagulation established

Note  For monitoring, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL; monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen

Unstable coronary artery disease, by subcutaneous injection, 120 units/kg every 12 hours (max. 10 000 units twice daily) for 5–8 days

Prevention of clotting in extracorporeal circuits, consult product literature

Injection (graduated syringe), dalteparin sodium 10 000 units/mL, net price 1-mL (10 000-unit) syringe = £5.65

Dose  unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction), by subcutaneous injection, 120 units/kg every 12 hours (max. 10 000 units twice daily) for up to 8 days, beyond 8 days (if awaiting angiography or revascularisation) women body-weight less than 80 kg and men less than 70 kg, 5000 units every 12 hours, women body-weight greater than 80 kg and men greater than 70 kg, 7500 units every 12 hours, until day of procedure (max. 45 days)

ENOXAPARIN SODIUM

Indications  see notes above and under preparations

Cautions  see under Heparin and notes above; low body-weight (increased risk of bleeding)

Contra-indications  see under Heparin
Hepatic impairment

manufacturer advises caution—
no information available

Renal impairment

risk of bleeding increased; reduce
dose if eGFR less than 30 mL/minute/1.73 m²—
consult product literature for details; monitoring of
anti-factor Xa may be required; use of unfractionated
heparin may be preferable

Pregnancy

not known to be harmful; see also
Pregnancy, p. 140

Breast-feeding

manufacturer advises avoid—no
information available

Side-effects

see under Heparin

Dose

See under preparation below

Clexane® (Sanofi-Aventis) \(\text{\textregistered}\)

Injection, enoxaparin sodium 100 mg/mL, net price
20 mg (0.2-mL, 2000-units) syringe = £3.03, 40-mg
(0.4-mL, 4000-units) syringe = £4.04, 60-mg (0.6-mL,
6000-units) syringe = £4.57, 80-mg (0.8-mL, 8000-
units) syringe = £8.49, 100-mg (1-mL, 10 000-units)
syringe = £8.04, 300 mg (3-mL, 30 000-units) vial
(Clexane® Multidose) = £21.33; 150 mg/mL
(Clexane® Forte), 120-mg (0.8-mL, 12 000-units)
syringe = £9.77, 150-mg (1-mL, 15 000-units) syringe
= £11.10

Excipients include benzyl alcohol (in 300 mg multidose vials) (avoid in
neonates, see Excipients, p. 2)

Dose

prophylaxis of deep-vein thrombosis especially in surgical
patients, by subcutaneous injection, moderate risk; 20 mg
(200 units) approx. 2 hours before surgery then 20 mg
(200 units) every 24 hours; high risk (e.g. orthopaedic surgery),
40 mg (4000 units) 12 hours before surgery then 40 mg
(4000 units) every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients, by
subcutaneous injection, 40 mg (4000 units) every 24 hours

Treatment of deep-vein thrombosis or pulmonary embolism, by
subcutaneous injection, 1.5 mg/kg (150 units/kg) every 24 hours until
adequate oral anticoagulation established

Treatment of acute ST-segment elevation myocardial infarction,
ADULT under 75 years, by intravenous injection, 30 mg
(3000 units) followed by subcutaneous injection, 1 mg/kg
(100 units/kg), then by subcutaneous injection, 1 mg/kg every 12
hours for up to 8 days (max. 100 mg (10 000 units) for first two
subcutaneous doses only); ELDERLY over 75 years, by subcuta-
neous injection only, 750 micrograms/kg (75 units/kg) every 12
hours (max. 75 mg (7500 units) for first two doses only); patients
undergoing percutaneous coronary intervention, additional dose,
by intravenous injection, 300 micrograms/kg (30 units/kg) at
time of procedure if last subcutaneous dose given more than 8
hours previously

Note

When administered in conjunction with a thrombolytic,
enoxaparin should be given between 15 minutes before and 30
minutes after the start of thrombolytic therapy

Unstable angina and non-ST-segment-elevation myocardial
infarction, by subcutaneous injection, 1 mg/kg (100 units/kg)
every 12 hours usually for 2–8 days (minimum 2 days)

Prevention of clotting in extracorporeal circuits, consult product
literature

Treatment of venous thromboembolism in pregnancy [unlicensed indication], by
subcutaneous injection, early pregnancy body-
weight under 50 kg, 40 mg (4000 units) twice daily; body-weight
50–70 kg, 60 mg (6000 units) twice daily; body-weight 70–90 kg,
80 mg (8000 units) twice daily; body-weight over 90 kg, 100 mg
(10 000 units) twice daily

2.8.1 Parenteral anticoagulants

Factor Xa may be required; use with caution in elderly
and avoid if age over 90 years; unfractionated heparin
can be preferable

Pregnancy

not known to be harmful; vials contain
benzyl alcohol—manufacturer advises avoid; see also
Pregnancy, p. 140

Breast-feeding

manufacturer advises avoid—no
information available

Side-effects

see under Heparin

Dose

See under preparations below

Innohep® (LEO) \(\text{\textregistered}\)

Injection, tinzaparin sodium 10 000 units/mL, net
price 2500-unit (0.25-mL) syringe = £1.98, 3500-unit
(0.35-mL) syringe = £2.77, 4500-unit (0.45-mL)
syringe = £3.56, 20 000-unit (2-mL) vial = £10.56

Excipients include benzyl alcohol (in vial) (avoid in neonates, see Exci-
pients, p. 2)

Dose

prophylaxis of deep-vein thrombosis, by subcutaneous
injection, general surgery, 3500 units 2 hours before surgery, then
3500 units every 24 hours, orthopaedic surgery, 30 units/kg 2
hours before surgery, then 50 units/kg every 24 hours or
4500 units 12 hours before surgery; then 4500 units every 24 hours

Prevention of clotting in extracorporeal circuits, consult product
literature

Injection, tinzaparin sodium 20 000 units/mL, net
price 0.5-mL (10 000-unit) syringe = £8.46, 0.7-mL
(14 000-unit) syringe = £11.85, 0.9-mL (18 000-unit)
syringe = £15.23, 2-mL (40 000-unit) vial = £34.20

Excipients include benzyl alcohol (in vial) (avoid in neonates, see Exci-
pients, p. 2), sulphates (in 20 000 units/mL vial and syringe)

Dose

treatment of deep-vein thrombosis and of pulmonary
embolism, by subcutaneous injection, 175 units/kg once daily
until adequate oral anticoagulation established

Treatment of venous thromboembolism in pregnancy [unlicensed indication], by
subcutaneous injection, 175 units/kg once daily

(based on early pregnancy body-weight)

Note

Treatment regimens do not require anticoagulation mon-
toring

Heparinoids

Danaparoid is a heparinoid used for prophylaxis of
deep-vein thrombosis in patients undergoing general
or orthopaedic surgery. Providing there is no evidence
of cross-reactivity, it also has a role in patients who
develop heparin-induced thrombocytopenia.

DANAPAROID SODIUM

Indications

prevention of deep-vein thrombosis in
general or orthopaedic surgery; thromboembolic dis-
ease in patients with history of heparin-induced
thrombocytopenia

Cautions

recent bleeding or risk of bleeding; concomi-
tant use of drugs that increase risk of bleeding;
antibodies to heparins (risk of antibody-induced
thrombocytopenia); body-weight over 90 kg (monitor
anti factor Xa activity)

Contra-indications

haemophilia and other haemor-
rhagic disorders, thrombocytopenia (unless patient
has heparin-induced thrombocytopenia), recent
cerebral haemorrhage, severe hypertension, active
peptic ulcer (unless this is the reason for operation),
diabetic retinopathy, acute bacterial endocarditis,
spinal or epidural anaesthesia with treatment doses of
danaparoid

Hepatic impairment

caution in moderate impairment
(increased risk of bleeding); avoid in severe impair-
ment unless patient has heparin-induced thrombocy-
topenia and no alternative available
## Cardiovascular system

### 144 2.8.1 Parenteral anticoagulants

**Renal impairment** caution in moderate impairment; increased risk of bleeding (monitor anti-Factor Xa activity); avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available

**Pregnancy** manufacturer advises avoid—limited information available but not known to be harmful

**Breast-feeding** amount probably too small to be harmful but manufacturer advises avoid

**Side-effects** bleeding; hypersensitivity reactions (including rash)

**Dose**
- Prevention of deep-vein thrombosis, by subcutaneous injection, 750 units twice daily for 7–10 days; initiate treatment before operation (with last pre-operative dose 1–4 hours before surgery)
- Thromboembolic disease in patients with history of heparin-induced thrombocytopenia, by intravenous injection, 2500 units (1250 units if body-weight under 55 kg, 3750 units if over 90 kg), followed by intravenous infusion of 400 units/hour for 2 hours, then 300 units/hour for 2 hours, then 200 units/hour for 5 days

**Angiox** (The Medicines Company) ▼  
Injection, danaparoid sodium 1250 units/mL, net price 0.6-mL amp (750 units) = £26.68

### Hirudins

**Lepirudin**, a recombinant hirudin, is licensed for anticoagulation in patients with Type II (immune) heparin-induced thrombocytopenia who require parenteral anti-thrombotic treatment. The dose of lepirudin is adjusted according to activated partial thromboplastin time (APTT). **Bivalirudin**, a hirudin analogue, is a thrombin inhibitor which is licensed for acute coronary syndromes in patients planned for urgent or early intervention, and as an anticoagulant for patients undergoing percutaneous coronary intervention (see also section 2.10.1); bivalirudin should be administered in combination with aspirin and clopidogrel. The **Scottish Medicines Consortium** (p. 4) has advised (November 2008) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland for patients with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone. The **Scottish Medicines Consortium** (p. 4) has advised (August 2010) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland as an anticoagulant in patients undergoing percutaneous coronary intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

### Bivalirudin

**Indications** acute coronary syndromes in patients planned for urgent or early intervention; anti-coagulation for patients undergoing percutaneous coronary intervention (PCI)

**Cautions** exposure to lepirudin (theoretical risk from lepirudin antibodies); brachytherapy procedures; concomitant use of drugs that increase risk of bleeding

**Contra-indications** severe hypertension; subacute bacterial endocarditis; active bleeding; bleeding disorders

**Renal impairment** for percutaneous coronary intervention, reduce rate of infusion to 1.4 mg/kg/hour if eGFR 30–60 mL/minute/1.73 m² and monitor blood clotting parameters; for acute coronary syndromes and percutaneous coronary intervention, avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** bleeding (discontinue), thrombosis, ecchymosis; less commonly nausea, vomiting, tachycardia, bradycardia, hypotension, angina, dyspnoea, allergic reactions (including isolated reports of anaphylaxis), headache, thrombocytopenia, anaemia, back and chest pain, and injection-site reactions

**Dose**
- Acute coronary syndromes (in addition to aspirin and clopidogrel), initially by intravenous injection, 100 micrograms/kg then by intravenous infusion 250 micrograms/kg/hour (for up to 72 hours in medically managed patients); patients proceeding to percutaneous coronary intervention or coronary artery bypass surgery without cardiopulmonary bypass, additional bolus dose by intravenous injection 500 micrograms/kg, then by intravenous infusion 1.75 mg/kg/hour for duration of procedure; following percutaneous coronary intervention, reduce infusion rate to 250 micrograms/kg/hour for 4–12 hours as necessary; patients proceeding to coronary artery bypass surgery with cardiopulmonary bypass, discontinue intravenous infusion 1 hour before procedure and treat with unfractionated heparin
- Anticoagulation in patients undergoing percutaneous coronary intervention (in addition to aspirin and clopidogrel), initially by intravenous injection, 750 micrograms/kg then by intravenous infusion 1.75 mg/kg/hour for up to 4 hours after procedure; a reduced infusion rate of 250 micrograms/kg/hour may be continued for a further 4–12 hours if necessary

**Angiox** (The Medicines Company) ▼ 
Injection, powder for reconstitution, bivalirudin, net price 250-mg vial = £310.00

### Lepirudin

**Indications** thromboembolic disease requiring parenteral anticoagulation in patients with heparin-induced thrombocytopenia type II

**Cautions** recent bleeding or risk of bleeding including recent puncture of large vessels, organ biopsy, recent major surgery, stroke, bleeding disorders, severe hypertension, bacterial endocarditis; concomitant use of drugs that increase risk of bleeding; determine activated partial thromboplastin time 4 hours after start of treatment (or after infusion rate altered) and at least once daily thereafter

**Hepatic impairment** no information—manufacturer advises that cirrhosis may affect renal excretion

**Renal impairment** reduce initial intravenous injection dose to 200 micrograms/kg and reduce subsequent infusion dose by 50–85% if eGFR less than 60 mL/
Flolan® (GSK) Inject, powder for reconstitution, epoprostenol (as sodium salt), net price 500-microgram vial (with diluent) = £62.05; 1.5-mg vial (w) (with diluent) = £125.00

Fondaparinux

Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

For details on the use of fondaparinux in the prophylaxis of venous thromboembolism, see section 2.8, p. 140.

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Heparin Sodium (Non-proprietary) Solution, heparin sodium 10 units/mL, net price 5-mL amp = £1.00; 100 units/mL, 2-mL amp = £1.05

Dose to maintain patency of catheters, cannulas, etc. 10–200 units flushed through every 4–8 hours. Not for therapeutic use. Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 2).

Epoprostenol

Epoprostenol (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anti-coagulation. Since its half-life is only about 3 minutes it must be given by continuous intravenous infusion. It is a potent vasodilator and therefore its side-effects include flushing, headache, and hypotension.

2.8.1 Parenteral anticoagulants

Epoprostenol

Indications see notes above

Cautions anticoagulant monitoring required when given with anticoagulants; haemorrhagic diathesis; dose titration for pulmonary hypertension should be in hospital (risk of pulmonary oedema); concomitant use of drugs that increase risk of bleeding

Contra-indications severe left ventricular dysfunction

Pregnancy manufacturer advises caution—no information available

Side-effects see notes above; also bradycardia, tachycardia, pallor, sweating with higher doses; gastro-intestinal disturbances; lassitude, anxiety, agitation; dry mouth, jaw pain, chest pain; also reported, hyperglycaemia and injection-site reactions

Dose

● See product literature

Fondaparinux Sodium

Indications prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness, and patients undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery; treatment of deep-vein thrombosis, superficial-vein thrombosis, and pulmonary embolism; treatment of unstable angina or non-ST-segment elevation myocardial infarction; treatment of ST-segment elevation myocardial infarction

Cautions bleeding disorders, active gastro-intestinal ulcer disease; recent intracranial haemorrhage; brain, spinal, or ophthalmic surgery; spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses); risk of catheter thrombus during percutaneous coronary intervention; low body-weight; elderly patients; concomitant use of drugs that increase risk of bleeding

Contra-indications active bleeding; bacterial endocarditis

Hepatic impairment caution in severe impairment (increased risk of bleeding)

Renal impairment increased risk of bleeding; for treatment of acute coronary syndromes avoid if eGFR less than 20 mL/minute/1.73 m²; for treatment of venous thromboembolism use with caution if eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²; for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m²; avoid if eGFR less than 20 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid unless potential benefit outweighs possible risk—no information available

Breast-feeding present in milk in animal studies—manufacturer advises avoid

Side-effects bleeding, purpura, anaemia; less commonly gastro-intestinal disturbances, oedema, hepatic impairment, chest pain, dyspnoea, thrombocytopenia, thrombocythaemia, rash, pruritus; rarely hypo-tension, flushing, cough, vertigo, dizziness, anxiety, drowsiness, confusion, headache, hypokalaemia, hyperbilirubinaemia, injection-site reactions; also reported atrial fibrillation, tachycardia, and pyrexia

Dose

● Prophylaxis of venous thromboembolism after surgery, by subcutaneous injection, 2.5 mg 6 hours after surgery then 2.5 mg once daily; CHILD under 17 years not recommended

Minute/1.73 m², but avoid or stop infusion if eGFR less than 15 mL/minute/1.73 m² (consult product literature)

Pregnancy avoid

Breast-feeding avoid

Side-effects bleeding; reduced haemoglobin concentration without obvious source of bleeding; fever, hypersensitivity reactions (including rash); injection-site reactions

Dose

● Initially by slow intravenous injection (of 5 mg/mL solution), 400 micrograms/kg followed by continuous intravenous infusion of 150 micrograms/kg/hour (max. 16.5 mg/hour), adjusted according to activated partial thromboplastin time, for 2–10 days (longer if necessary)

Refludan® (Celgene) Injection, powder for reconstitution, lepirudin, net price 50-mg vial = £57.00

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Heparin Sodium (Non-proprietary) Solution, heparin sodium 10 units/mL, net price 5-mL amp = £1.00; 100 units/mL, 2-mL amp = £1.05

Dose to maintain patency of catheters, cannulas, etc. 10–200 units flushed through every 4–8 hours. Not for therapeutic use. Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 2).
2.8.2 Oral anticoagulants

- Prophylaxis of venous thromboembolism in medical patients, by subcutaneous injection, 2.5 mg once daily; CHILD under 17 years not recommended
- Treatment of superficial-vein thrombosis, by subcutaneous injection, ADULT body-weight over 50 kg, 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications); treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively; CHILD under 17 years not recommended
- Unstable angina and non-ST-segment elevation myocardial infarction, by subcutaneous injection, 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner); treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively; CHILD under 17 years not recommended
- ST-segment elevation myocardial infarction, initially by intravenous injection or infusion, 2.5 mg for first day; thereafter by subcutaneous injection 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner); treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively; CHILD under 17 years not recommended
- Treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, ADULT body-weight under 50 kg, 5 mg every 24 hours; body-weight 50–100 kg, 7.5 mg every 24 hours; body-weight over 100 kg, 10 mg every 24 hours; continue until adequate oral anticoagulation established; CHILD under 17 years not recommended
- Arixtra® (GSK) Injection, fondaparinux sodium 5 mg/mL, net price 0.3 mL (1.5-mg) prefilled syringe = £6.28; 0.5 mL (2.5-mg) prefilled syringe = £6.28
- Injection, fondaparinux sodium 12.5 mg/mL, net price 0.4 mL (5-mg) prefilled syringe = £11.66, 0.6 mL (7.5-mg) prefilled syringe = £11.66, 0.8 mL (10-mg) prefilled syringe = £11.66

2.8.2 Oral anticoagulants

**Coumarins and phenindione**

The oral anticoagulants warfarin, acenocoumarol and phenindione, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; warfarin is the drug of choice. If an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

**Uses**

- Indications for these oral anticoagulants include deep-vein thrombosis, pulmonary embolism, atrial fibrillation in those who are at risk of embolisation (see also section 2.3.1), and mechanical prosthetic heart valves (to prevent emboli developing on the valves).
- These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin is more appropriate for reduction of risk in transient ischaemic attack (see p. 151). Unfractionated or a low molecular weight heparin (section 2.8.1) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin can be continued in selected patients currently taking long-term warfarin and who are at high risk of thromboembolism (seek expert advice).

**Dose**

The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

For patients who require rapid anticoagulation the usual adult induction dose of warfarin is 5–10 mg on the first day; subsequent doses depend upon the prothrombin time, reported as INR (international normalised ratio). For patients who do not require rapid anticoagulation, a lower loading dose can be used over 3–4 weeks. The daily maintenance dose of warfarin is usually 3–9 mg (taken at the same time each day). The following indications and target INRs take into account recommendations of the British Society for Haematology:

- INR 2.5 for treatment of deep-vein thrombosis and pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin), for atrial fibrillation, cardioversion (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR; anticoagulation should continue for at least 4 weeks following the procedure), dilated cardiomyopathy, mural thrombus, symptomatic inherited thrombophilia, coronary artery thrombosis (if anticoagulated), and paroxysmal nocturnal haemoglobinuria.
- INR 3.5 for recurrent deep-vein thrombosis and pulmonary embolism (in patients currently receiving warfarin with INR above 2).
- For mechanical prosthetic heart valves, the recommended target INR depends on the type and location of the valve. Generally, a target INR of 3 is recommended for mechanical aortic valves, and 3.5 for mechanical mitral valves.

**Monitoring**

It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer intervals (depending on response) then up to every 12 weeks.

**Haemorrhage**

The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The following recommendations are based on the result of the INR and whether there is major or

1. First dose reduced if base-line prothrombin time prolonged, if liver-function tests abnormal, or if patient in cardiac failure, on parenteral feeding, less than average body weight, elderly, or receiving other drugs known to potentiate oral anticoagulants.
2. An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.
4. Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. See also interactions, Appendix 1 (warfarin). Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect warfarin control.
minor bleeding; the recommendations apply to patients taking warfarin:

- Major bleeding—stop warfarin; give phytonadione (vitamin K$_1$) 5–10 mg by slow intravenous injection; give dried prothrombin complex (factors II, VII, IX, and X—section 2.11) 30–50 units/kg (if dried prothrombin complex unavailable, fresh frozen plasma 15 mL/kg can be given but is less effective)
- INR > 8.0, no bleeding or minor bleeding—stop warfarin and give phytonadione (vitamin K$_1$) 2.5–5 mg by mouth using the intravenous preparation orally [unlicensed use], or 0.5–1 mg by slow intravenous injection (if complete reversal required 5–10 mg by slow intravenous injection); repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin when INR < 5.0
- INR 5.0–8.0, no bleeding—stop warfarin; minor bleeding—stop warfarin and give phytonadione (vitamin K$_1$) 1–2.5 mg by mouth using the intravenous preparation orally [unlicensed use]; restart warfarin when INR < 5.0
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

Hepatic impairment  Warfarin, acenocoumarol, and phenindione should be avoided in severe impairment, especially if prothrombin time is already prolonged.

Renal impairment  Warfarin, acenocoumarol, and phenindione should be used with caution in mild to moderate impairment and avoided in severe impairment.

Pregnancy  Warfarin, acenocoumarol, and phenindione are teratogenic and should not be given in the first trimester of pregnancy. Women of child-bearing age should be warned of this danger since stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality. These oral anticoagulants cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters. Difficult decisions may have to be made, particularly in women with prosthesis heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism.

Breast-feeding  With warfarin, acenocoumarol, and phenindione there is a risk of haemorrhage which is increased by vitamin-K deficiency. Warfarin is not present in milk in significant amounts, and appears safe, but phenindione should be avoided; the manufacturer of acenocoumarol recommends prophylactic vitamin K for the infant (consult product literature).

Treatment booklets  Anticoagulant treatment booklets should be issued to patients, and are available for distribution to local healthcare professionals from Health Authorities and from: Synthrome (Alliance) £1.49; 1 mg (brown), 28-tab pack = £9.50; 5 mg (pink), 28-tab pack = £10.00. Label: 10, anticoagulant card

These booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. Electronic copies and further advice are also available at www.npsa.nhs.uk/nrls/alerts-directives/alerts/anticoagulant.

WARFARIN SODIUM

Indications  prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation; prophylaxis after insertion of prostatic heart valve; prophylaxis and treatment of venous thrombosis and pulmonary embolism; transient ischaemic attacks

Cautions  see notes above; also recent surgery; recent ischaemic stroke; history of gastro-intestinal bleeding; peptic ulcer; concomitant use of drugs that increase risk of bleeding; bacterial endocarditis (increased risk of bleeding; use only if warfarin otherwise indicated); avoid cranberry juice; interactions: Appendix 1 (coumarins)

Contra-indications  haemorrhagic stroke; significant bleeding; avoid use within 48 hours postpartum

Hepatic impairment  see notes above

Renal impairment  see notes above

Pregnancy  see notes above

Breast-feeding  see notes above

Side-effects  haemorrhage—see notes above; also nausea, vomiting, diarrhoea, jaundice, hepatic dysfunction, pancreatitis, pyrexia, alopecia, purpura, rash, ‘purple toes’, skin necrosis (increased risk in patients with protein C or protein S deficiency)

Dose  
- See notes above

Warfarin  (Non-proprietary)  Tablets, warfarin sodium 500 micrograms (white), net price 28-tab pack = £1.49; 1 mg (brown), 28-tab pack = £9.50; 3 mg (blue), 28-tab pack = £9.50; 5 mg (pink), 28-tab pack = £10.03. Label: 10, anticoagulant card

BRANDS INCLUDE Morenau®

Oral suspension, warfarin sodium 5 mg/5 mL, net price 150 mL = £90.00. Label: 10, anticoagulant card

ACENOCOUMAROL  (Nicoumalone)

Indications  see under Warfarin Sodium

Cautions  see under Warfarin Sodium

Contra-indications  see under Warfarin Sodium

Hepatic impairment  see notes above

Renal impairment  see notes above

Pregnancy  see notes above

Breast-feeding  see notes above

Side-effects  see under Warfarin Sodium

Dose  
- 4 mg on first day, 4–8 mg on second day; maintenance dose usually 1–8 mg daily adjusted according to response

Synthrome (Alliance) £4.27. Label: 10, anticoagulant card
### PHENINDIONE

**Indications** prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation; prophylaxis after insertion of prosthetic heart valve; prophylaxis and treatment of venous thrombosis and pulmonary embolism

**Cautions** see under Warfarin Sodium; interactions: Appendix 1 (phenindione)

**Contra-indications** see under Warfarin Sodium

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Warfarin Sodium; also hyper-sensitivity reactions including exfoliative dermatitis, exanthesma, fever, leucopenia, agranulocytosis, eosinophilia, and renal damage; micro-adenopathy and urine coloured pink or orange

---

### Dabigatran etexilate

Dabigatran etexilate, a direct thrombin inhibitor, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery; see Prophylaxis of Venous Thromboembolism in adults after total hip replacement or total knee replacement surgery.

**NICE guidance** Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008)

Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.

---

### Rivaroxaban

**Indications** see notes above

**Cautions** see notes above; also bleeding disorders; concomitant use of drugs that increase risk of bleeding; severe hypertension; active or recent gastrointestinal ulceration; vascular retinopathy; anaesthesia with postoperative indwelling epidural catheter (risk of paralyis—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before catheter removal); recent surgery; interactions: Appendix 1 (rivaroxaban)

**Contra-indications** active bleeding

**Hepatic impairment** avoid in severe liver disease, especially if prothrombin time already prolonged

---

## Renal impairment

- Reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if eGFR 30–50 mL/minute/1.73 m²; reduce dose to 75 mg once daily if eGFR 30–50 mL/minute/1.73 m² and patient receiving concomitant treatment with verapamil; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no commonly hepatobiliary disorders

### Dose

- **200 mg** on day 1; **100 mg** on day 2, then adjusted according to response; maintenance dose usually **50–150 mg** daily

**Phenindione (Non-proprietary)**

**Tablets**, phenindione 10 mg, net price 28-tab pack = £21.10; 25 mg, 28-tab pack = £27.36; 50 mg, 28-tab pack = £52.33.

**Pradaxa®** (Boehringer Ingelheim) Capsules, blue/ivory, dabigatran etexilate (as mesilate) 75 mg, net price 10-cap pack = £21.00, 60-cap pack = £126.00; 110 mg 10-cap pack = £21.00, 60-cap pack = £126.00.

**Label:** 10, anticoagulant card, 14, (urine pink or orange)
Hepatic impairment manufacturer advises caution in cirrhotic patients with moderate hepatic impairment; avoid in liver disease with coagulopathy

Renal impairment use with caution if eGFR 15–29 mL/minute/1.73 m² or if eGFR 30–49 mL/minute/1.73 m² and concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature); avoid if eGFR less than 15 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid—toxicity in animal studies

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects nausea; haemorrhage (see notes above); less commonly constipation, diarrhoea, dyspepsia, dry mouth, vomiting, hypotension, oedema, tachycardia, thrombocytopenia, syncope, dizziness, headache, renal impairment, pain in extremities, pruritus, and rash; jaundice also reported

Dose
- Prophylaxis of venous thromboembolism following knee replacement surgery, ADULT over 18 years, 10 mg once daily for 2 weeks starting 6–10 hours after surgery
- Prophylaxis of venous thromboembolism following hip replacement surgery, ADULT over 18 years, 10 mg once daily for 5 weeks starting 6–10 hours after surgery

Xarelto® (Bayer Schering) ▼ ▼ ▼
Tablets, red, f/c, rivaroxaban 10 mg, net price 10-tab pack = £44.15, 30-tab pack = £132.44, 100-tab pack = £441.45

2.8.3 Protamine sulphate

Protamine sulphate is used to treat overdosage of unfractionated or low molecular weight heparin. The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulphate; the effects of low molecular weight heparins can persist for up to 24 hours after administration. Excessive doses of protamine sulphate can have an anticoagulant effect.

PROTAMINE SULPHATE (Protamine Sulfate)

Indications see above

Cautions see above; also monitor activated partial thromboplastin time or other appropriate blood clotting parameters; increased risk of allergic reaction to protamine (including previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy)

Side-effects nausea, vomiting, lassitude, flushing, hypotension, hypertension, bradycardia, dyspnoea, rebound bleeding, back pain; hypersensitivity reactions (including angioedema, anaphylaxis) and pulmonary oedema reported

Dose
- Overdosage with intravenous injection of unfractionated heparin, by intravenous injection (rate not exceeding 5 mg/minute), 25–50 mg once heparin infusion stopped
- Overdosage with subcutaneous injection of unfractionated heparin, 1 mg neutralises 100 units heparin; give 25–50 mg by intravenous injection (rate not exceeding 5 mg/minute) then any remaining dose given by intravenous infusion over 8–16 hours; max. total dose 50 mg
- Overdosage with subcutaneous injection of low molecular weight heparin, by intermittent intravenous injection (rate not exceeding 5 mg/minute) or by continuous intravenous infusion, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); max. 50 mg

Protamine Sulphate (Non-proprietary) ▼ ▼ ▼
Injection, protamine sulphate 10 mg/mL, net price 5-mL amp = £1.43, 10-mL amp = £4.15

2.9 Antiplatelet drugs

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Use of aspirin in primary prevention of cardiovascular events, in patients with or without diabetes, is of unproven benefit. Long-term use of aspirin, in a dose of 75 mg daily, is of benefit in established cardiovascular disease (secondary prevention); unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastrointestinal bleeding, a proton pump inhibitor (section 1.3.5) can be added.

Aspirin in a dose of 75–300 mg daily is given following coronary bypass surgery. For details on the use of aspirin in atrial fibrillation see section 2.3.1; for intermittent claudication see section 2.6.4; for stable angina and acute coronary syndromes see section 2.10.1; for use following placement of coronary stents see below; for use in stroke see also below.

Clopidogrel is licensed for the prevention of ischaemic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation (section 2.10.1); in these circumstances the combination is given for up to 12 months (most benefit occurs during the first 3 months; there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation (section 2.10.1); the combination is licensed for at least 4 weeks, but the optimum treatment duration has not been established. In patients undergoing percutaneous coronary intervention, clopidogrel is used as an adjunct with aspirin (see also below). Patients, who are not already taking clopidogrel, should receive a 300 mg loading dose prior to the procedure; alternatively, a 600 mg [unlicensed] loading dose may produce a greater and more rapid inhibition of platelet aggregation. Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy is an alternative when aspirin is contra-indi-
2 Cardiovascular system

Prasugrel, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention (section 2.10.1); the combination is usually given for up to 12 months. The Scottish Medicines Consortium (p. 4) has advised (August 2009) that prasugrel (Efient®), in combination with aspirin, be accepted for restricted use within NHS Scotland for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention who are eligible to receive the 10 mg dose of prasugrel.

NICE guidance

Prasugrel for the treatment of acute coronary syndromes with percutaneous coronary intervention (October 2009)

Prasugrel, in combination with aspirin, is an option for the prevention of atherothrombotic events in patients with acute coronary syndromes undergoing percutaneous coronary intervention, only when:
- immediate primary percutaneous coronary intervention is necessary for ST-segment elevation myocardial infarction, or
- stent thrombosis occurred during treatment with clopidogrel, or
- the patient has diabetes mellitus.

Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and clopidogrel, or aspirin and prasugrel. Aspirin therapy should continue indefinitely. Clopidogrel is recommended for 1 month following elective percutaneous coronary intervention with placement of a bare-metal stent, and for 12 months if percutaneous coronary intervention with placement of a bare-metal stent was for an acute coronary syndrome; clopidogrel should be given for 12 months following placement of a drug-eluting stent. Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent—there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel. Prasugrel is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see notes above).

Glycoprotein IIb/IIIa inhibitors

Glycoprotein IIb/IIIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab is a monoclonal antibody which binds to glycoprotein IIb/IIIa receptors and to other related sites; it is licensed as an adjunct to unfractionated heparin and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). Eptifibatide and tirofiban also inhibit glycoprotein IIb/IIIa receptors; they are licensed for use with unfractionated heparin and aspirin to prevent early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (section 2.10.1). Abciximab, eptifibatide and tirofiban should be used by specialists only.

For use of epoprostenol, see section 2.8.1.

Management of stroke

Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following notes give an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage.

cated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor.

For details on the use of clopidogrel in stroke, see below. The Scottish Medicines Consortium (p. 4) has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients only. The Scottish Medicines Consortium has also advised (July 2007) that clopidogrel be accepted for restricted use for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

Dipyridamole is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release dipyridamole monotherapy is restricted to 4 weeks only.

in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:
- an ischaemic stroke, or who have peripheral arterial disease or multivascular disease, or
- a myocardial infarction, only if aspirin is contra-indicated or not tolerated.

Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:
- a transient ischaemic attack, or
- an ischaemic stroke, only if clopidogrel is contra-indicated or not tolerated.

Modified-release dipyridamole monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:
- an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, or
- a transient ischaemic attack, only if aspirin is contra-indicated or not tolerated.
Transient ischaemic attack

Patients suspected of having a transient ischaemic attack should immediately receive aspirin 300 mg once daily (patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel 75 mg once daily [unlicensed use] as an alternative). Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke, below).

Ischaemic stroke

Initial management  Alteplase (section 2.10.2) is recommended in the treatment of acute ischaemic stroke if it can be administered within 3 hours of symptom onset; it should be given by medical staff experienced in the administration of thrombolitics and the treatment of acute stroke, preferably within a specialist stroke centre. Treatment with aspirin 300 mg once daily for 14 days should be initiated 24 hours after thrombolysis (or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis); patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel 75 mg once daily [unlicensed use] as an alternative.

Anticoagulants are not recommended as an alternative to antiplatelet drugs in acute ischaemic stroke in patients who are in sinus rhythm. However, parental anticoagulants (section 2.8.1) may be indicated in patients who are symptomatic of, or at high risk of developing, deep vein thrombosis or pulmonary embolism; warfarin should not be commenced in the acute phase of ischaemic stroke.

Anticoagulants (section 2.8.2) should be considered after cardio-embolic ischaemic stroke in patients with atrial fibrillation, however patients presenting with atrial fibrillation following a disabling ischaemic stroke should receive aspirin 300 mg once daily for 14 days, before being considered for warfarin treatment. Patients already receiving anticoagulation for a prosthetic heart valve who experience a disabling ischaemic stroke and are at significant risk of haemorrhagic transformation, should have their anticoagulant treatment stopped for 7 days and substituted with aspirin 300 mg once daily.

Treatment of hypertension in the acute phase of ischaemic stroke can result in reduced cerebral perfusion, and should therefore only be instituted in the event of a hypertensive emergency (see section 2.5). Beta-blockers should not be used in the management of hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and smoking.

Long-term management  Patients receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke, above, and section 2.3). Anticoagulants are not routinely recommended in the long-term prevention of recurrent stroke, except in patients with atrial fibrillation (section 2.3).

A statin (section 2.12) should be initiated 48 hours after stroke symptom onset, irrespective of the patient’s serum-cholesterol concentration.

Following the acute phase of ischaemic stroke, blood pressure should be measured and treatment initiated to achieve a target blood pressure of <130/80 mmHg (see section 2.5). Beta-blockers should not be used in the management of hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and smoking.

Intracerebral haemorrhage

Initial management  Surgical intervention may be required following intracerebral haemorrhage to remove the haematoma and relieve intracranial pressure. Patients taking anticoagulants should have this treatment stopped and reversed (see section 2.8.2); anticoagulant therapy has, however, been used in patients with intracerebral haemorrhage who are symptomatic of deep vein thrombosis or pulmonary embolism; placement of a caval filter is an alternative in this situation.

Long-term management  Aspirin therapy should only be given to patients at a high risk of a cardiac ischaemic event. Blood pressure should be measured and treatment initiated where appropriate (see section 2.5), taking care to avoid hypoperfusion. Statins should be avoided following intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk of further haemorrhage.

ABCIXIMAB

Indications  prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention; short-term prevention of myocardial infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (use under specialist supervision)

Cautions  measure baseline prothrombin time, activated clotting time, activated partial thromboplastin time, platelet count, haemoglobin and haematocrit; monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment; concomitant use of drugs that increase risk of bleeding; discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed; consult product literature for details of procedures to minimise bleeding; elderly
Contra-indications active internal bleeding; major surgery, intracranial or intraspinal surgery or trauma within last 2 months; stroke within last 2 years; intracranial neoplasm, arteriovenous malformation or aneurysm, severe hypertension, haemorrhagic diathesis, thrombocytopenia, vasculitis, hypertensive retinopathy

Renal impairment avoid in severe liver disease—increased risk of bleeding

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects bleeding manifestations; nausea, vomiting, hypotension, bradycardia, chest pain, back pain, headache, fever, puncture site pain, thrombocytopenia; rarely cardiac tamponade, adult respiratory distress, hypersensitivity reactions

Dose

• ADULT initially by intravenous injection over 1 minute, 250 micrograms/kg, then by intravenous infusion, 125 nanograms/kg/minute (max. 10 micrograms/minute); for prevention of ischaemic complications start 10–60 minutes before percutaneous coronary intervention and continue infusion for 12 hours; for unstable angina start up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention

ReoPro® (Lilly) Injection, abciximab 2 mg/mL, net price 5-mL vial = £250.24

ASPIRIN (antiplatelet)
(Acetylsalicylic Acid)

Indications secondary prevention of thrombotic cerebrovascular or cardiovascular disease, and following by-pass surgery (see also section 2.10.1 and notes above)

Cautions asthma; uncontrolled hypertension; previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration); concomitant use of drugs that increase risk of bleeding; G6PD deficiency (section 9.1.5); interactions: Appendix 1 (aspirin)

Contra-indications use other than as an antiplatelet in children and adolescents under 16 years (Reye’s syndrome, section 4.7.1); active peptic ulceration; haemophilia and other bleeding disorders

Hypersensitivity Aspirin and other NSAIDs are contraindicated in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID

Hepatic impairment avoid in severe impairment—increased risk of gastro-intestinal bleeding

Renal impairment use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding

Pregnancy use with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); with high doses, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus in jaundiced neonates

Breast-feeding avoid—possible risk of Reye’s syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low

Side-effects bronchospasm; gastro-intestinal irritation, gastro-intestinal haemorrhage (occasionally major), also other haemorrhage (e.g. subconjunctival)

Dose

• See notes above

1 Aspirin (Non-proprietary) (Farr)

Dispersible tablets, aspirin 75 mg, net price 28 = £3.12; 300 mg, see section 4.7.1. Label: 5, 25, 32

Tablets, e/c, aspirin 75 mg, net price 28-tab pack = £1.51, 56-tab pack = £2.52, 100-tab pack = £5.24; 300 mg, see section 4.7.1. Label: 5, 25, 32

Brands include Microprin®

Caprin® (Pinewood) (Fm)

Tablets, e/c, pink, aspirin 75 mg, net price 28-tab pack = £1.51, 56-tab pack = £2.52, 100-tab pack = £5.24; 300 mg, see section 4.7.1. Label: 5, 25, 32

Nu-Seals® Aspirin (Alliance) (Fm)

Tablets, e/c, aspirin 75 mg, net price 56-tab pack = £3.12; 300 mg, see section 4.7.1. Label: 5, 25, 32

Note Tablets may be chewed at diagnosis for rapid absorption

CLOPIDOGREL

Indications prevention of atherosclerotic events in peripheral arterial disease, or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke; prevention of atherosclerotic events in acute coronary syndrome without ST-segment elevation (given with aspirin—see notes above) and in acute myocardial infarction with ST-segment elevation (given with aspirin—see notes above)

Cautions patients at risk of increased bleeding from trauma, surgery or other pathological conditions; concomitant use of drugs that increase risk of bleeding; discontinue 7 days before elective surgery if antiplatelet effect not desirable; interactions: Appendix 1 (clopidogrel)

Contra-indications active bleeding

Hepatic impairment manufacturer advises caution (risk of bleeding); avoid in severe impairment

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid

Side-effects dyspepsia, abdominal pain, diarrhoea; bleeding disorders (including gastro-intestinal and intracranial); less commonly nausea, vomiting, gastrointestinal, flatulence, constipation, gastric and duodenal ulcers, headache, dizziness, paraesthesia, leucopénia, decreased platelets (very rarely severe thrombocytopenia), eosinophilia, rash, and pruritus; rarely vertigo; very rarely colitis, pancreatitis, hepatitis, acute liver failure, vasculitis, confusion, hallucinations, taste disturbance, stomatitis, bronchospasm, interstitial pneumonitis, blood disorders (including thrombocytopenic

1. Aspirin tablets 75 mg may be sold to the public in packs of up to 100 tablets; for details relating to other strengths see section 4.7.1 and Medicines, Ethics and Practice, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available)
purpura, agranulocytosis and pancytopenia), and hypersensitivity-like reactions (including fever, glomerulonephritis, arthritis, Stevens-Johnson syndrome, toxic epidermal necrolysis, lichen planus)

Dose
- Prevention of atherosclerotic events in peripheral arterial disease or after myocardial infarction or ischaemic stroke, 75 mg once daily
- Acute coronary syndrome (without ST-segment elevation), initially 300 mg then 75 mg daily (with aspirin—see notes above)
- Acute myocardial infarction (with ST-segment elevation), initially 300 mg then 75 mg daily (with aspirin—see notes above); initial dose omitted if patient over 75 years

Clopidogrel (Non-proprietary) (Boehringer Ingelheim)

Tablets, clopidogrel (as besilate or hydrochloride) 75 mg, net price 28-tab pack = £3.17, 30-tab pack = £3.40
Brands include: Grepida®

Plavix® (Sanofi-Aventis) (Boehringer Ingelheim)

Tablets, pink, f/c, clopidogrel (as hydrogen sulphate) 75 mg, net price 30-tab pack = £35.64; 300 mg, 30-tab pack = £142.54

Dipyridamole

Indications see notes above and under Dose

Cautions rapidly worsening angina, aortic stenosis, recent myocardial infarction, left ventricular outflow obstruction, heart failure; may exacerbate migraine; hypotension; myasthenia gravis (risk of exacerbation); coagulation disorders; concomitant use of drugs that increase risk of bleeding; interactions: Appendix 1 (dipyridamole)

Pregnancy not known to be harmful

Breast-feeding manufacturers advise use only if essential—small amount present in milk

Side-effects gastro-intestinal effects, dizziness, myalgia, throbbing headache, hypotension, hot flushes and tachycardia; worsening symptoms of coronary heart disease; hypersensitivity reactions such as rash, urticaria, severe bronchospasm and angioedema; increased bleeding during or after surgery; thrombocytopenia reported

Dose
- By mouth, 300–600 mg daily in 3–4 divided doses
- Modified-release preparations, see under preparation below
- By intravenous injection, diagnostic only; consult product literature

Dipyridamole (Non-proprietary) (Boehringer Ingelheim)

Tablets, coated, dipyridamole 25 mg, net price 84 = £13.11; 100 mg, net price 84-tab pack = £8.20. Label: 22

Oral suspension, dipyridamole 50 mg/5 mL, net price 150 mL = £40.63

Persantin® (Boehringer Ingelheim) (GSK)

Tablets, s/c, dipyridamole 25 mg (orange), net price 84-tab pack = £14.99; 100 mg, 84-tab pack = £4.16. Label: 22
Injection, dipyridamole 5 mg/mL, net price 2-mL amp = 12p

2.9 Antiplatelet drugs

Modified release

Persantin® Retard (Boehringer Ingelheim) (GSK)

Capsules, m/r, red/orange containing yellow pellets, dipyridamole 200 mg, net price 60-cap pack = £9.00. Label: 21, 25

Dose secondary prevention of ischaemic stroke and transient ischaemic attacks (used alone or with aspirin), adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves, 200 mg twice daily preferably with food

Note Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening

With aspirin

For prescribing information on aspirin, see under Aspirin, p. 152

Asasantin® Retard (Boehringer Ingelheim) (GSK)

Capsules, red/ivory, aspirin 25 mg, dipyridamole 200 mg (m/r), net price 60-cap pack = £7.79. Label: 21, 25

Dose secondary prevention of ischaemic stroke and transient ischaemic attacks, 1 capsule twice daily

Note Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening

EPTIFIBATIDE

Indications prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (use under specialist supervision)

Cautions risk of bleeding, concomitant drugs that increase risk of bleeding—discontinue immediately if uncontrolled serious bleeding; measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine; monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment then at least once daily; discontinue if thrombolytic therapy, intra-aortic balloon pump or emergency cardiac surgery necessary

Contra-indications abnormal bleeding within 30 days, major surgery or severe trauma within 6 weeks, stroke within last 30 days or any history of haemorrhagic stroke, intracranial disease (aneurysm, neoplasm or arteriovenous malformation), severe hypertension, haemorrhagic diathesis, increased prothrombin time or INR, thrombocytopenia

Hepatic impairment avoid in severe liver disease—increased risk of bleeding

Renal impairment reduce infusion to 1 microgram/kg/minute if eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects bleeding manifestations; very rarely anaphylaxis and rash

Dose
- Initially by intravenous injection, 180 micrograms/kg, then by intravenous infusion, 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

Integrilin® (GSK) (Sanofi-Aventis)

Injection, eptifibatide 2 mg/mL, net price 10-mL (20-mg) vial = £13.61
Infusion, eptifibatide 750 micrograms/mL, net price 100-mL (75-mg) vial = £42.79
2.10 Stable angina, acute coronary syndromes, and fibrinolysis

**PRASUGREL**

**Indications** in combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention.

**Contraindications** abnormal bleeding within 30 days, stroke within 30 days or any history of haemorrhagic stroke, intracranial disease (aneurysm, neoplasm or arteriovenous malformation), severe hypertension, haemorrhagic diathesis, increased prothrombin time or INR, thrombocytopenia, increased risk of bleeding; avoid in severe liver disease—increased risk of bleeding.

**Renal impairment** increased risk of bleeding; monitor carefully if eGFR less than 60 mL/minute/1.73 m²; use half normal dose if eGFR less than 30 mL/minute/1.73 m².

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available.

**Breast-feeding** manufacturer advises avoid—no information available.

**Hepatic impairment** caution in mild to moderate liver disease; avoid in severe liver disease—increased risk of bleeding.

**Side-effects** bleeding manifestations; reversible thrombocytopenia.

**Dose**  
- **ADULT** over 18 years, (with aspirin—see notes above) initially 60 mg as a single dose then body-weight over 60 kg, 10 mg once daily or body-weight under 60 kg or **ELDERLY** over 75 years, 5 mg once daily.

**Eliet® (Lilly)** Tablets, f/c, prasugrel (as hydrochloride) 5 mg (yellow), net price 28-tab pack = £47.56; 10 mg (beige), 28-tab pack = £47.56.

**TIROFIBAN**

**Indications** prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 12 hours (use under specialist supervision).

**Contra-indications** active bleeding; history of stroke or transient ischaemic attack.

**Cautions** patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or active peptic ulcer disease); concomitant use of drugs that increase risk of bleeding; discontinue at least 7 days before elective surgery if antplatelet effect not desirable; elderly; body-weight less than 60 kg; **interactions**: Appendix 1 (prasugrel).

**Eliet® (Lilly)** Concentrate for intravenous infusion, tirofiban (as hydrochloride) 250 micrograms/mL, net price 250-mL vial = £160.72.

**Aggrastat® (Chiesi)** Concentrate for intravenous infusion, tirofiban (as hydrochloride) 50 micrograms/mL, net price 50-mL (12.5-mg) vial = £146.11.

2.10 Stable angina, acute coronary syndromes, and fibrinolysis

2.10.1 Management of stable angina and acute coronary syndromes

2.10.2 Fibrinolytic drugs

**Stable angina**

It is important to distinguish stable angina from unstable angina. **Stable angina** usually results from atherosclerotic plaques in the coronary arteries and is often precipitated by exertion and relieved by rest. Treatment involves management of acute anginal pain, and long-term management to prevent angina attacks and to reduce the risk of cardiovascular events.

**Management of stable angina**

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate (section 2.6.1); sublingual glyceryl trinitrate can also be taken before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a step-wise manner according to response.
Patients with mild or moderate stable angina should be given a beta-blocker (section 2.4). In those with left-ventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months (section 2.5.5).

For those patients in whom beta-blockers are not tolerated or are contra-indicated, a long-acting nitrateg (section 2.6.1) or a rate-limiting calcium-channel blocker (diltiazem or verapamil, section 2.6.2) can be used; in patients with left-ventricular dysfunction, diltiazem and verapamil are contra-indicated because heart failure may be precipitated (important: see p. 128); however, a long-acting dihydropyridine calcium-channel blocker, such as amlopidine or felodipine, is suitable. Nicorandil or ivabradine (section 2.6.3) are alternatives.

When a single drug fails to control symptoms, combination treatment can be used. A calcium-channel blocker can be added to a beta-blocker, although combining verapamil with a beta-blocker should be avoided (see p. 133); combinations including diltiazem and a beta-blocker should be used with caution. Long-acting nitrates can also be used with a beta-blocker or a calcium-channel blocker, if appropriate. Combinations that include nicorandil or ranolazine (section 2.6.3) can also be considered.

Patients should be referred to a specialist if a combination of two drugs fails to control symptoms. Revascularisation procedures may be appropriate; see section 2.9 for the use of antiplatelet drugs in patients undergoing coronary stenting.

For long-term prevention of cardiovascular events, see Prevention of cardiovascular events, p. 156.

Management of unstable angina and non-ST-segment elevation myocardial infarction

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.

Initial management. Oxygen (section 3.6) should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

Nitrates (section 2.6.1) are used to relieve ischaemic pain. If sublingual glyceryl trinitrate is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate is given. If pain continues, diamorphine or morphine (section 4.7.2) can be given by slow intravenous injection; an antiemetic such as metoclopramide should also be given (section 4.6).

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect in a dose of 300 mg (section 2.9). If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel in a dose of 300 mg (or 600 mg [unlicensed] if used prior to percutaneous coronary intervention) should also be given (see section 2.9). Prasugrel, in a dose of 60 mg, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance, p. 150). Patients should also receive either unfractionated heparin, a low molecular weight heparin, or fondaparinux (section 2.8.1).

Patients without contra-indications should receive beta-blockers (section 2.4) which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem or verapamil can be given (section 2.6.2).

The glycoprotein IIB/IIIa inhibitors eptifibatide and tirofiban (section 2.9) can be used (with aspirin and unfractionated heparin) for unstable angina or for non-ST-segment elevation myocardial infarction in patients at a high risk of either myocardial infarction or death.

In intermediate- and high-risk patients, abciximab, eptifibatide, or tirofiban can also be used with aspirin and unfractionated heparin in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin (section 2.8.1) can be considered as an alternative to the combination of a glycoprotein IIB/IIIa inhibitor plus a heparin.

Revascularisation procedures are often appropriate for patients with unstable angina or non-ST-segment elevation myocardial infarction (NSTEMI); see section 2.9 for the use of antiplatelet drugs in patients undergoing coronary stenting.

Long-term management. The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment (see management of stable angina, above) to prevent recurrence of symptoms.

Acute coronary syndromes

Acute coronary syndromes encompass a spectrum of conditions which include unstable angina, and myocardial infarction with or without ST-segment elevation. Patients with different acute coronary syndromes may present similarly; definitive diagnosis is made on the basis of clinical presentation, ECG changes, and measurement of biochemical cardiac markers.

Unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) are related acute coronary syndromes that fall between the classifications of stable angiia and ST-segment elevation myocardial infarction (STEMI). They usually occur as a result of atheromatous plaque rupture, and are often characterised by stable angina that suddenly worsens, recurring or prolonged angina at rest, or new onset of severe angina. Patients with unstable angina have no evidence of myocardial necrosis, whereas in NSTEMI, myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest.

ST-segment elevation myocardial infarction (STEMI) is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also occasionally occur as a result of coronary spasm or embolism, arthritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.
Prevention of cardiovascular events Patients with stable and unstable angina should be given advice and treatments to reduce their cardiovascular risk. The importance of lifestyle changes, especially stopping smoking, should be emphasised. Patients should take aspirin indefinitely in a dose of 75 mg daily. In patients with non-ST-segment elevation acute coronary syndrome, a combination of aspirin and clopidogrel (section 2.9) is given for up to 12 months; most benefit occurs during the first 3 months. An ACE inhibitor (section 2.5.5.1) and a statin (section 2.12) should also be given.

Management of ST-segment elevation myocardial infarction

These notes give an overview of the initial and long-term management of myocardial infarction with ST-segment elevation. For advice on the management of non-ST-segment elevation myocardial infarction and unstable angina, see above. The aims of management of ST-segment elevation myocardial infarction are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diamorphine or morphine can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolysis promote reperfusion; antiplatelet drugs help to reduce re-occlusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Initial management Oxygen (section 3.6) should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease. The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diamorphine or morphine (section 4.7.2); an antiemetic such as metoclopramide (or, if left ventricular function is not compromised, cyclizine) by intravenous injection should also be given (section 4.6).

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect (section 2.9); a dose of 300 mg is suitable. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel, in a dose of 300 mg (or 600 mg [unlicensed] if used prior to percutaneous coronary intervention), should also be given (section 2.9). Prasugrel, in a dose of 60 mg, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance, p. 150). Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a thrombolytic drug (section 2.10.2), unless contra-indicated. Percutaneous coronary intervention is the preferred method; a glycoprotein IIb/IIIa inhibitor (section 2.9) can be used to reduce the risk of immediate vascular occlusion in intermediate- and high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either unfractionated heparin or a low molecular weight heparin (e.g. enoxaparin); bivalirudin (section 2.8.1) is an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin. In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administered along with either unfractionated heparin (for maximum 2 days), a low molecular weight heparin (e.g. enoxaparin), or fondaparinux. See section 2.9 for the use of antiplatelet drugs in patients undergoing coronary stenting. Patients who do not receive reperfusion therapy (with percutaneous coronary intervention or a thrombolytic) should be treated with either fondaparinux, enoxaparin, or unfractionated heparin. Prescribers should consult product literature and local protocols (where they exist) for details of anticoagulant dose and duration.

Nitrates (section 2.6.1) are used to relieve ischaemic pain. If sublingual glyceryl trinitrate is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate is given.

Early administration of some beta-blockers (section 2.4) has been shown to be of benefit and should be given to patients without contra-indications.

ACE inhibitors (section 2.5.5.1), and angiotensin-II receptor antagonists (section 2.5.5.2) if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment). All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive insulin.

Long-term management Long-term management following ST-segment elevation myocardial infarction involves the use of several drugs which should ideally be started before the patient is discharged from hospital.

Aspirin (section 2.9) should be given to all patients, unless contra-indicated, at a dose of 75 mg daily. The addition of clopidogrel (section 2.9) has been shown to reduce morbidity and mortality. For those intolerant of both aspirin and clopidogrel, warfarin alone can be used. Warfarin should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin increases the risk of bleeding. See section 2.9 for details of antiplatelet drug duration following coronary stenting.

Beta-blockers (section 2.4) should be given to all patients in whom they are not contra-indicated. Atebrutolol, metoprolol, propranolol, and timolol are suitable; for patients with left ventricular dysfunction, carve-dilol, bisoprolol, or long-acting metoprolol may be appropriate (section 2.5.5).

Diltiazem [unlicensed] or verapamil (section 2.6.2) can be considered if a beta-blocker cannot be used; however, they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.
An ACE inhibitor (section 2.5.5.1) should be considered for all patients, especially those with evidence of left ventricular dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

Nitrates (section 2.6.1) are used for patients with angina.

Eplerenone (section 2.2.3) is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure.

For the role of statins in preventing recurrent cardiovascular events, see section 2.12.

### 2.10.2 Fibrinolytic drugs

Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

The value of thrombolytic drugs for the treatment of myocardial infarction has been established (section 2.10.1). Streptokinase and alteplase have been shown to reduce mortality. Reteplase and tenecteplase are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients.

Alteplase, reteplase and streptokinase need to be given within 12 hours of symptom onset, ideally within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase, and urokinase can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke (see section 2.9).

Urokinase is also licensed to restore the patency of fibrin clots.

### Cautions

Thrombolytic drugs should be used with caution if there is a risk of bleeding including that from venepuncture or invasive procedures. They should also be used with caution in external chest compression, elderly, hypertension, conditions in which thrombolyisis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation), and recent or concurrent use of drugs that increase the risk of bleeding.

### Contra-indications

Thrombolytic drugs are contra-indicated in recent haemorrhage, trauma, or surgery (including dental extraction), coagulation defects, bleeding diathesis, aortic dissection, aneurysm, coma, history of cerebrovascular disease especially recent events or with any residual disability, recent symptoms of possible peptic ulceration, heavy vaginal bleeding, severe hypertension, active pulmonary disease with cavitation, acute pancreatitis, pericarditis, bacterial endocarditis, and oesophageal varices; also in the case of streptokinase, previous allergic reactions to either streptokinase or anistreplase (no longer available).

Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

### Hepatic impairment

Thrombolytic drugs should be avoided in severe hepatic impairment as there is an increased risk of bleeding.

### Pregnancy

Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.

### Side-effects

Side-effects of thrombolytics are mainly nausea and vomiting and bleeding. When thrombolytics are used in myocardial infarction, reperfusion arrhythmias and recurrent ischaemia and angina may occur. Reperfusion may also cause cerebral and pulmonary oedema. Hypotension can also occur and can usually be controlled by elevating the patient’s legs, or by reducing the rate of infusion or stopping it temporarily. Back pain, fever, and convulsions have been reported. Bleeding is usually limited to the site of injection, but intracerebral haemorrhage or bleeding from other sites can occur.

Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli). Thrombolytics can cause allergic reactions (including rash, flushing and uveitis) and anaphylaxis has been reported (for details of management see Allergic Emergencies, section 3.4.3). Guillain-Barré syndrome has been reported rarely after streptokinase treatment.

---

**ALTEPLASE**

(rt-PA, tissue-type plasminogen activator)

### Indications

- acute myocardial infarction (see notes above and section 2.10.1); pulmonary embolism; acute ischaemic stroke (treatment under specialist neurology physician only)

### Cautions

- see notes above; in acute stroke, monitor for intracranial haemorrhage, monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg)

### Contra-indications

- see notes above; in acute stroke, convulsion accompanying stroke, severe stroke, history of stroke in patients with diabetes, stroke in last 3 months, hypoglycaemia, hyperglycaemia

### Hepatic impairment

- see notes above

### Pregnancy

- see notes above

### Side-effects

- see notes above; also risk of cerebral bleeding increased in acute stroke
Dose
- Myocardial infarction, accelerated regimen (initiated within 6 hours of symptom onset), 15 mg by intravenous injection, followed by intravenous infusion of 50 mg over 30 minutes, then 35 mg over 60 minutes (total dose 100 mg over 90 minutes); in patients less than 65 kg, 15 mg by intravenous injection, followed by intravenous infusion of 0.75 mg/kg over 30 minutes, then 0.5 mg/kg over 60 minutes (max. total dose 100 mg over 90 minutes)
- Myocardial infarction, initiated within 6–12 hours of symptom onset, 10 mg by intravenous injection, followed by intravenous infusion of 50 mg over 60 minutes, then 4 infusions each of 10 mg over 30 minutes (total dose 100 mg over 3 hours; max. 1.5 mg/kg in patients less than 65 kg)
- Pulmonary embolism, 10 mg by intravenous injection over 1–2 minutes, followed by intravenous infusion of 90 mg over 2 hours; max. 1.5 mg/kg in patients less than 65 kg
- Acute stroke (treatment must begin within 3 hours of symptom onset), by intravenous administration over 60 minutes, 900 micrograms/kg (max. 90 mg); initial 10% of dose by intravenous injection, remainder by intravenous infusion; ELDERLY over 80 years not recommended

Actilyse® (Boehringer Ingelheim) Injection, powder for reconstitution, alteplase 10 mg (5.8 million units)/vial, net price per vial (with diluent) = £120.00; 20 mg (11.6 million units)/vial (with diluent and transfer device) = £180.00; 50 mg (29 million units)/vial (with diluent, transfer device, and infusion bag) = £300.00

Retepase
Indications acute myocardial infarction (see notes above and section 2.10.1)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Pregnancy see notes above
Breast-feeding manufacturer advises avoid breast-feeding for 24 hours after dose (express and discard milk during this time)
Side-effects see notes above
Dose
- By intravenous injection over 10 seconds (initiated within 6 hours of symptom onset), 30–50 mg according to body-weight—consult product literature; max. 50 mg

Tenecteplase
Indications acute myocardial infarction (see notes above and section 2.10.1)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Pregnancy see notes above
Breast-feeding manufacturer advises avoid breast-feeding for 24 hours after dose (express and discard milk during this time)
Side-effects see notes above
Dose
- By intravenous injection over 10 seconds (initiated within 12 hours of symptom onset), by intravenous infusion, 1.5 million units over 60 minutes
- Deep-vein thrombosis, pulmonary embolism, acute arterial thromboembolism, central retinal venous or arterial thrombosis, by intravenous infusion, 250 000 units over 30 minutes, then 100 000 units every hour for up to 12–72 hours according to condition with monitoring of clotting parameters (consult product literature)

Streptokinase
Indications deep-vein thrombosis, pulmonary embolism, acute arterial thromboembolism, central retinal venous or arterial thrombosis, by intravenous infusion, 250 000 units over 30 minutes, then 100 000 units every hour for up to 12–72 hours according to condition with monitoring of clotting parameters (consult product literature)
Cautions see notes above and section 2.10.1
Contra-indications see notes above
Hepatic impairment see notes above
Pregnancy see notes above
Breast-feeding manufacturer advises avoid breast-feeding for 24 hours after dose (express and discard milk during this time)
Side-effects see notes above
Dose
- By intravenous injection over 10 seconds (initiated within 6 hours of symptom onset), 30–50 mg according to body-weight—consult product literature; max. 50 mg

Urokinase
Indications thromboembolic occlusive vascular disease including deep-vein thrombosis, pulmonary embolism, and peripheral vascular occlusion; occluded intravenous catheters and cannulas blocked by fibrin clots
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Pregnancy see notes above
Breast-feeding manufacturer advises avoid—no information available
Side-effects see notes above
Dose
- Deep-vein thrombosis, by intravenous infusion, initially 4400 units/kg in 15 mL sodium chloride 0.9% over 10 minutes, followed by 4400 units/kg/hour for 12–24 hours
- Pulmonary embolism, by intravenous infusion, initially 4400 units/kg in 15 mL sodium chloride 0.9% over 10 minutes, followed by 4400 units/kg/hour for 12 hours or by injection into pulmonary artery, initially 15 000 units/kg, subsequent doses adjusted according to response; max. 3 doses in 24 hours
2.11 Antifibrinolytic drugs and haemostatics

Fibrin dissolution can be impaired by the administration of tranexamic acid, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in prostatectomy, bladder surgery, in dental extraction in patients with haemophilia, in conisation of the cervix, and in traumatic haemorrhage) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in thrombotic overdose.

Desmopressin (section 6.5.2) is used in the management of mild to moderate haemophilia and von Willebrand’s disease. It is also used for fibrinolytic response testing.

Etamsylate reduces capillary bleeding in the presence of a normal number of platelets; it does not act by fibrin stabilisation, but probably by correcting abnormal adhesion. Etamsylate is less effective than other treatments in the management of heavy menstrual bleeding and its use is no longer recommended.

ETAMSYLATE

(Ethamsylate)

Indications  blood loss in menorrhagia

Cautions  exclude structural or histological causes of menorrhagia, or fibrinoids causing distortion of the uterine cavity, before initiating treatment

Contra-indications  acute porphyria (see section 9.8.2)

Breast-feeding  present in milk—manufacturer advises avoid

Side-effects  nausea, vomiting, diarrhoea, fever (discontinue treatment), headache, rashes

Dose  ● 500 mg 4 times daily during menstruation

Dicynene® (Sanofi-Aventis)

Tablets, scored, etamsylate 500 mg, net price 100-tab pack = £8.44

Excipients include sulphites

TRANEXAMIC ACID

Indications  see notes above

Cautions  massive haematuria (avoid if risk of ureteric obstruction); not for use in disseminated intravascular coagulation, irregular menstrual bleeding (exclude structural or histological causes of menorrhagia, or fibrinoids causing distortion of the uterine cavity, before initiating treatment); regular liver function tests in long-term treatment of hereditary angioedema

Contra-indications  thromboembolic disease

Renal impairment  reduce dose—consult product literature for details

Pregnancy  no evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

Breast-feeding  small amount present in milk—antifibrinolytic effect in infant unlikely

Side-effects  nausea, vomiting, diarrhoea (reduce dose); rarely disturbances in colour vision (discontinue), thromboembolic events, convulsions, allergic skin reactions; dizziness and hypotension on rapid intravenous injection

Dose  ● By mouth, local fibrinolysis, 1–1.5 g (or 15–25 mg/kg) 2–3 times daily

Menorrhagia (initiated when menstruation has started), 1 g 3 times daily for up to 4 days; max. 4 g daily

Hereditary angioedema, 1–1.5 g 2–3 times daily

Epistaxis, 1 g 3 times daily for 7 days

By slow intravenous injection, local fibrinolysis, 0.5–1 g 3 times daily

By continuous intravenous infusion, local fibrinolysis, following initial treatment by intravenous injection, 25–50 mg/kg over 24 hours

Tranexamic acid (Non-proprietary)

Tablets, tranexamic acid 500 mg, net price 60-tab pack = £5.27

Cyklokapron® (Meda)

Tablets, f/c, scored, tranexamic acid 500 mg, net price 60-tab pack = £14.30

Cyklokapron® (Pfizer)

Injection, tranexamic acid 100 mg/mL, net price 5-mL amp = £1.55

Blood products

DRIED PROTHROMBIN COMPLEX

(Human Prothrombin Complex)

Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X

Indications  treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X or if purified specific coagulation factors not available; treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment—see section 2.8.2)

Cautions  risk of thrombosis; disseminated intravascular coagulation; history of myocardial infarction or coronary heart disease; postoperative use

Contra-indications  angina; recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy); history of heparin-induced thrombocytopenia
2.11 Antifibrinolytic drugs and haemostatics

**Hepatic impairment** monitor closely (risk of thrombomembolic complications)

**Side-effects** thrombotic events (including disseminated intravascular coagulation); rarely headache; very rarely pyrexia, antibody formation, hypersensitivity reactions (including anaphylaxis); nephrotic syndrome also reported

Available from CSL Behring (Berplex® P/M), Octapharma (Octaplex®)

**DROTRECOGIN ALFA (ACTIVATED)**
Recombinant activated protein C

**Indications** adjunctive treatment of severe sepsis with multiple organ failure—start treatment within 24 hours (and no later than 48 hours) after onset of organ failure

**Cautions** increased risk of bleeding, concomitant use of drugs that increase risk of bleeding; interactions: Appendix 1 (drotrecog alfa)

**Contra-indications** internal bleeding; intracranial neoplasm or cerebral herniation; thrombocytopenia; not recommended for use in children under 18 years or in single organ failure

**Hepatic impairment** avoid in chronic severe liver disease

**Pregnancy** manufacturer advises avoid unless benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** bleeding; headache; ecchymosis; pain
Available from Lilly (Xigris®)

**NICE guidance**
Drotrecog alfa (activated) for severe sepsis (September 2004)

Drotrecog alfa (activated) should be considered for adults with severe sepsis that has resulted in the failure of two or more major organs and who are receiving optimum intensive care support. Drotrecog alfa (activated) should be initiated and supervised only by a specialist consultant with intensive care skills and experience in the care of patients with sepsis.

**FACTOR VIII FRACTION, DRIED**
Eptacog alfa (activated)

**Indications** treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann’s thrombasthenia

**Cautions** risk of thrombosis or disseminated intravascular coagulation

**Side-effects** very rarely nausea, thrombotic events (including myocardial infarction and cerebrovascular accident), coagulation disorders, fever, pain, and allergic reactions including rash
Available from Novo Nordisk (NovoSeven®)

**FACTOR VIII INHIBITOR BYPASSING FRACTION**
Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma

**Indications** treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors; treatment of haemorrhage in non-haemophiliac patients with acquired factor VIII inhibitors

**Contra-indications** disseminated intravascular coagulation

**Side-effects** thrombosis, disseminated intravascular coagulation, myocardial infarction; paraesthesia; pyrexia; hypersensitivity reactions including hypotension, flushing, urticaria, rash, and anaphylaxis
Available from Baxter (FEIBA®)

**FACTOR IX FRACTION, DRIED**
Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X

**Indications** treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

**Cautions** risk of thrombosis—principally with former low purity products

**Contra-indications** disseminated intravascular coagulation

**Side-effects** gastro-intestinal disturbances; headache, dizziness; allergic reactions, including chills, fever
Available from CSL Behring (Mononine®), BPL (Replene®®, VIF, Dried Factor IX Fraction), Grifols (AlphaNine®)

**Note** Preparation of recombinant coagulation factor IX (non-acog alfa) available from Wyeth (BenefIX®)

**FACTOR XIII FRACTION, DRIED**
(Human Fibrin-stabilising Factor, Dried)

**Indications** congenital factor XIII deficiency

**Side-effects** rarely, allergic reactions and fever
Available from CSL Behring (Fibrogammin® P)
1. Cardiovascular disease risk may be determined from the sclerotic cardiovascular disease; those with a 10-year risk of developing atherosclerotic disease, those with diabetes mellitus (primary prevention) and to prevent recurrence of cardiovascular disease events, irrespective of serum cholesterol concentration, and is the drug of first choice for primary and secondary prevention of cardiovascular disease.

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

Indications to replace coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced.

Cautions need for compatibility.

Side-effects allergic reactions including chills, fever, bronchospasm; adult respiratory distress syndrome.

Note A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (Octaplasm®).

2.12 Lipid-regulating drugs

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease; those with diabetes mellitus aged over 40 years, and those with familial hypercholesterolaemia. The risk also increases with age; those over 75 years are at particularly high risk, especially if they smoke or have hypertension.

Preventative measures are also required for other individuals who may be at high risk of developing atherosclerotic cardiovascular disease; those with diabetes mellitus aged over 40 years, and those with familial hypercholesterolaemia. The risk also increases with age; those over 75 years are at particularly high risk, especially if they smoke or have hypertension.

Preventative measures are also required for other individuals who may be at high risk of developing atherosclerotic cardiovascular disease; those with diabetes mellitus aged over 40 years, and those with familial hypercholesterolaemia. The risk also increases with age; those over 75 years are at particularly high risk, especially if they smoke or have hypertension.

Patients with hypothyroidism should receive adequate thyroid replacement therapy before assessing the risk in individual patients.

Patients with hypothyroidism should receive adequate thyroid replacement therapy before assessing the risk in individual patients.

1 Cardiovascular disease risk may be determined from the chart issued by the Joint British Societies (Heart 2005; 91 (Suppl V): v1–v52)—see inside back cover. The Joint British Societies’ “Cardiac Risk Assessor” computer programme may also be used to determine cardiovascular disease risk.
risk of Muscle Effects, below. Patients with heterozygous familial hypercholesterolemia who have contra-indica-
tions to, or are intolerant of, statins should receive ezetimibe. The combination of a statin and ezetimibe can be considered if a statin alone fails to provide adequate control (or if intolerance limits dose titration), and when a switch to an alternative statin is being considered. Patients for whom statins and ezetimibe are inappropriate, should be referred to a specialist for the consideration of treatment with a bile acid seque-
trant, nicotinic acid, or a fibrate.

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a spe-
cialist centre.

**Statins**

The statins (atorvastatin, fluvastatin, pravastatin, rosuvastatin, and simvastatin) competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver. Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. How-
ner, statins reduce cardiovascular disease events and total mortality irrespective of the initial cholesterol concentration. Statins should be considered for all patients, including the elderly, with symptomatic cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlu-
sive arterial disease (including peripheral vascular dis-
eease, non-haemorrhagic stroke, or transient ischaemic attacks).

In patients with diabetes mellitus, the risk of developing cardiovascular disease depends on the duration and complications of diabetes, age, and concomitant risk factors. Statin therapy should be considered for all patients over 40 years with diabetes mellitus (type 1 and 2). In younger patients with diabetes, treatment with a statin should be considered if there is target-
organ damage, poor glycaemic control (HbA1c greater than 9%), low HDL-cholesterol and raised triglyceride concentration, hypertension, or a family history of pre-
mature cardiovascular disease.

Statins are also used for the prevention of cardiovascu-
lar disease events in asymptomatic individuals who are at increased risk (see p. 161). Statin treatment should also be considered if the total cholesterol concentration to HDL-cholesterol ratio exceeds 6.

**Cautions**

Hypothyroidism should be managed ade-
quately before starting treatment with a statin (see p. 161). Statins should be used with caution in those with a history of liver disease or with a high alcohol intake—see also Hepatic impairment, below. There is little information available on a rational approach to liver-function monitoring; however, a NICE guideline suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxi-
city. Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy. Statins should be used with caution in those with risk factors for myo-
pathy or rhabdomyolysis; patients should be advised to report unexplained muscle pain (see Muscle Effects below). Statins should be avoided in acute porphyria (section 9.8.2) but rosuvastatin is thought to be safe.

**Interactions:** Appendix 1 (statins).

**Hepatic impairment** Statins should be used with caution in those with a history of liver disease and avoided in active liver disease or when there are unex-
plained persistent elevations in serum transaminases.

**Pregnancy** Statins should be avoided in pregnancy as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development. Adequate contraception is required during treatment and for 1 month afterwards.

**Breast-feeding** The manufacturers of atorvastatin, fluvastatin, rosuvastatin, and simvastatin advise avoid-
ing use in mothers who are breast-feeding as there is no information available. The manufacturers of pravastatin advise against use in breast-feeding mothers as a small amount of drug is present in breast milk.

**Side-effects** The statins can cause various muscular side-effects, including myositis, which can lead to rhab-
domyolysis. Muscular effects are rare but often signifi-
cant (see Muscle Effects below). Statins can cause gastro-intestinal disturbances, and very rarely pancreat-
itis. They can also cause altered liver function tests, and rarely hepatitis and jaundice; hepatic failure has been reported very rarely. Other side-effects include sleep disturbance, headache, dizziness, depression, paraes-
thesia, asthenia, peripheral neuropathy, amnesia, fati-
gue, sexual dysfunction, thrombocytopenia, arthralgia,
visual disturbance, alopecia, and hypersensitivity reac-
tions (including rash, pruritus, urticaria, and very rarely lupus erythematosus-like reactions). In very rare cases, statins can cause interstitial lung disease; if patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

**Muscle effects** Myalgia, myositis, myopathy and rarely rhab-
domyolysis have been reported with the statins; if myopathy is suspected and creatine kinase is markedly elevated (more than 5 times upper limit of normal), or muscular symptoms are severe, treatment should be discontinued, in patients at increased risk of muscle effects, a statin should not be started if creatine kinase is elevated. Patients at increased risk of myo-
pathy include those with a personal or family history of muscular disorders, previous history of muscular toxicity; those with a high alcohol intake, renal impairment, hypothyroidism, women, and the elderly. There is also an increased incidence of myopathy if a statin is given at a high dose or given with a fibrate, with lipid-lowering doses of nicotinic acid, or with drugs that increase the plasma-statin concentration, such as ciclosporin; close monitoring of liver function and, if symptomatic, of creatine kinase is required in patients receiving these drugs. Rhabdomyolysis with acute renal impairment secondary to myoglobinuria has also been reported.

**Counselling** Advise patient to report promptly unex-
plained muscle pain, tenderness, or weakness.
**ATORVASTATIN**

**Indications** primary hypercholesterolaemia, heterozygous familial hypercholesterolaemia, homozygous familial hypercholesterolaemia or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients with type 2 diabetes and at least one additional risk factor for cardiovascular disease

**Cautions** see notes above; also haemorrhagic stroke

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also chest pain; back pain; less commonly anorexia, malaise, weight gain, hypoglycaemia, hyperglycaemia, tinnitus; rarely cholesterol jaundice, peripheral oedema; very rarely taste disturbances, gynaecomastia, hearing loss, Stevens-Johnson Syndrome, and toxic epidermal necrolysis

**Dose**
- Primary hypercholesterolaemia and combined hyperlipidaemia, usually 10 mg once daily; if necessary, may be increased at intervals of at least 4 weeks to max. 80 mg once daily; **CHILD 10–17 years** initially 10 mg once daily (limited experience with doses above 20 mg daily)
- Familial hypercholesterolaemia, initially 10 mg daily, increased at intervals of at least 4 weeks to 40 mg once daily; if necessary, further increased to max. 80 mg once daily (or 40 mg once daily combined with anion-exchange resin in heterozygous familial hypercholesterolaemia); **CHILD 10–17 years** initially 10 mg daily; increased if necessary after at least 4 weeks to 20 mg once daily (limited experience with higher doses)
- Prevention of cardiovascular events in type 2 diabetes, 10 mg once daily

**Note** Max. 10 mg daily with concomitant ciclosporin; max. 20 mg once daily (or temporarily discontinue atorvastatin) with concomitant clarithromycin; max. 40 mg daily (or temporarily discontinue atorvastatin) with concomitant immunosuppressive therapy following solid-organ transplantation

**Lipitor** (Pfizer)

- **Tablets**, all f/c, atorvastatin (as calcium trihydrate) 10 mg, net price 28-tab pack = £13.00; 20 mg, 28-tab pack = £24.64; 40 mg 28-tab pack = £24.64; 80 mg 28-tab pack = £28.21. Counselling, muscle effects, see notes above

**FLUVASTATIN**

**Note** The Scottish Medicines Consortium (p. 4) has advised (February 2004) that fluvastatin is accepted for restricted use for the secondary prevention of coronary events after percutaneous coronary angioplasty; if the patient has previously been receiving another statin, then there is no need to change the statin

**Indications** adjunct to diet in primary hypercholesterolaemia or combined (mixed) hyperlipidaemia (types IIa and IIb); adjunct to diet to slow progression of coronary atherosclerosis in primary hypercholesterolaemia and concomitant coronary heart disease; prevention of coronary events after percutaneous coronary intervention

**Cautions** see notes above

**Hepatic impairment** see notes above

**Renal impairment** manufacturer advises doses above 40 mg daily should be initiated with caution if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also very rarely vasculitis

**Dose**
- Hypercholesterolaemia or combined hyperlipidaemia, initially 20–40 mg daily in the evening, adjusted at intervals of at least 4 weeks; up to 80 mg daily may be required; **CHILD under 18 years**, see **BNF for Children**
- Prevention of progression of coronary atherosclerosis, 40 mg daily in the evening
- Following percutaneous coronary intervention, 80 mg daily

Fluvastatin (Non-proprietary)  

- **Capsules**, fluvastatin (as sodium salt) 20 mg, net price 28-cap pack = £5.03; 40 mg, 28-cap pack = £5.36.
- **Counselling**, muscle effects, see notes above

**Lescol** (Novartis)

- **Capsules**, fluvastatin (as sodium salt) 20 mg (brown/yellow), net price 28-cap pack = £15.26; 40 mg (brown/orange), 28-cap pack = £15.26; 56-cap pack = £30.53. Counselling, muscle effects, see notes above

**Modified release**

Lescol® XL (Novartis)

- **Tablets**, m/r, yellow, fluvastatin (as sodium salt) 80 mg, net price 28-tab pack = £19.20. Label: 25, counselling, muscle effects, see notes above

- **Dose** 80 mg once daily (dose form not appropriate for initial dose titration in hypercholesterolaemia or combined hyperlipidaemia)

**PRAVASTATIN SODIUM**

**Indications** adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control; adjunct to diet to prevent cardiovascular events in patients with hypercholesterolaemia; prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina; reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

**Cautions** see notes above

**Hepatic impairment** see notes above

**Renal impairment** manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; less commonly abnormal urination (including dysuria, nocturia and frequency); very rarely fulminant hepatic necrosis

**Dose**
- Hypercholesterolaemia or combined hyperlipidaemias, 10–40 mg once daily at night, adjusted at intervals of at least 4 weeks
- Familial hypercholesterolaemia, **CHILD 8–14 years** 10–20 mg once daily at night, 14–18 years 10–40 mg once daily at night
- Prevention of cardiovascular events, 40 mg once daily at night
- Post-transplantation hyperlipidaemia, initially 20 mg once daily at night, increased if necessary (under close medical supervision) to max. 40 mg once daily at night
2 Cardiovascular system

Pravastatin (Non-proprietary) Tablets, pravastatin sodium 10 mg, net price 28-tab pack = £1.72; 20 mg, 28-tab pack = £2.02; 40 mg, 28-tab pack = £2.78. Counselling, muscle effects, see notes above

Lipostat® Tablets, all yellow, pravastatin sodium 10 mg, net price 28-tab pack = £14.18; 20 mg, 28-tab pack = £26.01; 40 mg, 28-tab pack = £26.01. Counselling, muscle effects, see notes above

## ROSUVASTATIN

### Indications
Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients at high risk of a first cardiovascular event

### Cautions
See notes above; patients of Asian origin (see under Dose); max. dose 20 mg in patients with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity)

### Hepatic impairment
See notes above

### Renal impairment
Initially 5 mg once daily (do not exceed 20 mg daily) if eGFR 30–60 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

### Pregnancy
See notes above

### Breast-feeding
See notes above

### Side-effects
See notes above; also diabetes mellitus; proteinuria; very rarely haematuria

### Dose
- Hypercholesterolaemia, initially 5–10 mg once daily increased if necessary at intervals of at least 4 weeks to 20 mg once daily, increased after further 4 weeks to 40 mg daily only in severe hypercholesterolaemia with high cardiovascular risk and under specialist supervision; ELDERLY initially 5 mg once daily; patients of ASIAN origin, initially 5 mg once daily increased if necessary to max. 20 mg daily
- Prevention of cardiovascular events, 20 mg once daily

### Note
Initially 5 mg once daily with concomitant fibrate increased if necessary to max. 20 mg daily

### With ezetimibe
Note For homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone. For prescribing information on ezetimibe, see Ezetimibe

### Inegy® Tablets, simvastatin 20 mg, ezetimibe 10 mg, net price 28-tab pack = £33.42; simvastatin 40 mg, ezetimibe 10 mg, 28-tab pack = £38.98; simvastatin 80 mg, ezetimibe 10 mg, 28-tab pack = £41.21. Counselling, muscle effects, see notes above

---

## SIMVASTATIN

### Indications
Primary hypercholesterolaemia, homozygous familial hypercholesterolaemia or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus

### Cautions
See notes above; also 80-mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

### Hepatic impairment
See notes above

### Renal impairment
doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m²

### Pregnancy
See notes above

### Breast-feeding
See notes above

### Side-effects
See notes above; also rarely anaemia

### Dose
- Primary hypercholesterolaemia, combined hyperlipidaemia, 10–20 mg daily at night, adjusted at intervals of at least 4 weeks; usual range 10–80 mg once daily at night
- Homozygous familial hypercholesterolaemia, 40 mg daily at night or 80 mg daily in 3 divided doses (with largest dose at night)
- Prevention of cardiovascular events, initially 20–40 mg once daily at night, adjusted at intervals of at least 4 weeks; max. 80 mg once daily at night

### Note
Max. 10 mg daily with concomitant ciclosporin, danazol, or fibrate (except fenofibrate). Max. 20 mg daily with concomitant amiodarone or verapamil. Max. 40 mg daily with diltiazem or amiodipine

### With ezetimibe
Note For homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone. For prescribing information on ezetimibe, see Ezetimibe

### Inegy® Tablets, simvastatin 20 mg, ezetimibe 10 mg, net price 28-tab pack = £33.42; simvastatin 40 mg, ezetimibe 10 mg, 28-tab pack = £38.98; simvastatin 80 mg, ezetimibe 10 mg, 28-tab pack = £41.21. Counselling, muscle effects, see notes above

---

### Bile acid sequestrants

Colestervelam, colestipol, and colestyramine are bile acid sequestrants used in the management of hypercholesterolaemia. They act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma. Bile

---

1. Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15% risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease
acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia.

**Cautions** Bile acid sequestrants interfere with the absorption of fat-soluble vitamins; supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged. **Interactions:** Appendix 1 (bile acid sequestrants)

**Pregnancy and breast-feeding** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

**Side-effects** As bile acid sequestrants are not absorbed, gastro-intestinal side-effects predominate. Constipation is common, but diarrhoea has occurred, as have nausea, vomiting, and gastro-intestinal discomfort. Hypertriglyceridaemia may be aggravated. An increased bleeding tendency has been reported due to hypoprothrombinaemia associated with vitamin K deficiency.

**Counselling** Other drugs should be taken at least 1 hour before (4 hours before colesevelam), or 4–6 hours after bile acid sequestrants to reduce possible interference with absorption. Colesevelam can be taken at the same time as a statin or ezetimibe.

---

**COLESEVELAM HYDROCHLORIDE**

**Indications** primary hypercholesterolaemia as an adjunct to dietary measures, either alone or with a statin; primary and familial hypercholesterolaemia, in combination with ezetimibe, either with or without a statin

**Cautions** see notes above; also gastro-intestinal motility disorders, major gastro-intestinal surgery, inflammatory bowel disease; patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with colesevelam; **interactions:** Appendix 1 (colesevelam)

**Contra-indications** bowel or biliary obstruction

**Hepatic impairment** manufacturer advises caution

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also headache; myalgia

**Dose**

- Lipid reduction, initially 4 g daily increased by 4 g at weekly intervals to 12–24 g daily in 1–4 divided doses, then adjusted as required; max. 36 g daily
- **Pruritus**, see section 1.9.2
- Diarrhoeal disorders, see section 1.9.2

**Note** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content

**Colestyramine (Non-proprietary)**

- **Powder**, sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £18.34. Label: 13, counselling, avoid other drugs at same time (see notes above)
- Excipients may include aspartame (see section 9.4.1)

**Questran®** (Bristol-Myers Squibb)

- **Powder**, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £10.76. Label: 13, counselling, avoid other drugs at same time (see notes above)
- Excipients include sucrose 3.79 g/sachet

**Questran Light®** (Bristol-Myers Squibb)

- **Powder**, sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £16.15. Label: 13, counselling, avoid other drugs at same time (see notes above)
- Excipients include aspartame (see section 9.4.1)

---

**COLESTIPOL HYDROCHLORIDE**

**Indications** hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures

**Cautions** see notes above; **interactions:** Appendix 1 (colestipol)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- Initially 5 g 1–2 times daily in liquid increased if necessary in 5-g increments at intervals of 1 month to max. 30 g daily (in 1–2 divided doses)

**Note** The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, yoghurt, and pulpy fruits with a high moisture content

**Colestid®** (Pharmacia)

- **Granules**, yellow, colestipol hydrochloride 5 g/sachet, net price 30 sachets = £15.05. Label: 13, counselling, avoid other drugs at same time (see notes above)

**Colestid Orange**, granules, yellow/orange, colestipol hydrochloride 5 g/sachet, with aspartame, net price 30 sachets = £15.05. Label: 13, counselling, avoid other drugs at same time (see notes above)
### Ezetimibe

Ezetimibe inhibits the intestinal absorption of cholesterol. It is licensed as an adjunct to dietary manipulation in patients with primary hypercholesterolaemia in combination with a statin or alone (if a statin is inappropriate), in patients with homozygous familial hypercholesterolaemia in combination with a statin, and in patients with homozygous familial sitosterolaemia (phytosterolaemia). If ezetimibe is used in combination with a statin, there is an increased risk of rhabdomyolysis (see also Muscle Effects, p. 162).

### BEZAFIBRATE

Indications hyperlipidaemias of types IIa, IIb, III, IV, and V in patients who have not responded adequately to diet and other appropriate measures; also see notes above

Cautions correct hypothyroidism before initiating treatment (see p. 161); interactions: Appendix 1 (fibrates)

Contra-indications hypoalbuminaemia, primary biliary cirrhosis, gall bladder disease, nephrotic syndrome

Hepatic impairment avoid in severe liver disease

Renal impairment reduce dose to 400 mg daily if eGFR 40–60 mL/minute/1.73 m²; reduce dose to 200 mg every 1–2 days if eGFR 15–40 mL/minute/1.73 m²; avoid if eGFR less than 15 mL/minute/1.73 m²; avoid modified-release preparations if eGFR less than 60 mL/minute/1.73 m²

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly

Pregnancy manufacturers advise avoid—embryotoxicity in animal studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances; headache, fatigue, myalgia; rarely arthralgia, hypersensitivity reactions (including rash, angioedema, and anaphylaxis); hepatitis; very rarely pancreatitis, cholelithiasis, cholecytitis, thrombocytopenia, raised creatine kinase, myopathy, and rhabdomyolysis

### Fibrates

Fibrates can cause a myositis-like syndrome, especially if renal function is impaired. Also, combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution (see Muscle Effects, p. 162) and monitoring of liver function and creatine kinase should be considered; gemfibrozil and statins should not be used concomitantly.

### Appendix 1 (ezetimibe)

- **Dose**
  - **Adult** and **Child** over 10 years, 10 mg once daily
  - **Ezetrol** (MSD, Schering-Plough)
    - Tablets, ezetimibe 10 mg, net price 28-tab pack = £26.31
  - **With simvastatin**
    - See under Simvastatin

### Bezafibrate

Bezafibrate, ciprofibrate, fenofibrate, and gemfibrozil act mainly by decreasing serum triglycerides; they have variable effects on LDL-cholesterol. Although a fibrate can reduce the risk of coronary heart disease events in those with low HDL-cholesterol or with raised triglycerides, a fibrate should be used first. Fibrates are first-line therapy only in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin. In type 2 diabetes a fibrate can be added to a statin for those with a serum-triglyceride concentration exceeding 2.3 mmol/litre, despite 6 months of treatment with a statin and optimal glycaemic control.
**CIPROFIBRATE**

**Indications** hyperlipidaemias of types IIa, IIb, III, and IV in patients who have not responded adequately to diet; also see notes above

**Cautions** see under Bezafibrate

**Contra-indications** see under Bezafibrate

**Hepatic impairment** avoid in severe liver disease

**Renal impairment** manufacturer advises reduce dose to 100 mg on alternate days in moderate impairment; avoid in severe impairment; see also Myotoxicity under Bezafibrate

**Pregnancy** manufacturers advise avoid—embryotoxicity in animal studies

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see under Bezafibrate

- 100 mg daily

**Ciprofibrate (Non-proprietary) £28.00**

**Dose**

- 100 mg daily

**FENOFIBRATE**

**Indications** hyperlipidaemias of types IIa, IIb, III, IV, and V in patients who have not responded adequately to diet and other appropriate measures; also see notes above

**Cautions** see under Bezafibrate; liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised)

**Contra-indications** gall bladder disease; pancreatitis (unless due to severe hypertriglyceridaemia); photosensitivity to ketoprofen

**Hepatic impairment** avoid in severe liver disease

**Renal impairment** reduce dose to 134 mg daily if eGFR less than 60 mL/minute/1.73 m²; reduce dose to 67 mg daily if eGFR less than 20 mL/minute/1.73 m²; avoid if eGFR less than 15 mL/minute/1.73 m²; see also Myotoxicity under Bezafibrate

**Pregnancy** manufacturer advises avoid—embryotoxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see under Bezafibrate; also very rarely hepatitis, pancreatitis, and interstitial pneumopathies

**Dose**

- See preparations below

**Fenofibrate (Non-proprietary) £28.00**

- **Capsules**, fenofibrate (micronised) 200 mg, net price 28-cap pack = £23.30. Label: 21
- **Dose** 1 capsule daily (dose form not appropriate for children or in renal impairment)

- **Capsules**, fenofibrate (micronised) 267 mg, net price 28-cap pack = £17.95. Label: 21
- **Dose** initially 1 capsule daily (dose form not appropriate for children or in renal impairment)

**Lipantil® 160 (Abbott) £28.00**

- **Tablets**, f/c, fenofibrate (micronised) 160 mg, net price 28-tab pack = £6.69. Label: 21
- **Dose** 160 mg daily (dose form not appropriate for children or in renal impairment)

**GEMFIBROZIL**

**Indications** hyperlipidaemias of types IIa, IIb, III, IV and V in patients who have not responded adequately to diet and other appropriate measures; primary prevention of cardiovascular disease in men with hyperlipidaemias that have not responded to diet and other appropriate measures; also see notes above

**Cautions** lipid profile, blood counts, and liver-function tests before initiating long-term treatment; preferably avoid use with statins (high risk of rhabdomyolysis); correct hypothyroidism before initiating treatment (see p. 161); elderly; **interactions**: Appendix 1 (fibrates)

**Contra-indications** alcoholism, biliary-tract disease including gallbladder, photosensitivity to fibrates

**Hepatic impairment** avoid in liver disease

**Renal impairment** initially 900 mg daily if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²; see also Myotoxicity under Bezafibrate

**Pregnancy** manufacturers advise avoid—embryotoxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances; headache, fatigue, vertigo; eczema, rash; less commonly atrial fibrillation; rarely pancreatitis, appendicitis, disturbances in liver function including hepatitis and cholestatic jaundice, dizziness, paraesthesia, sexual dysfunction, thrombocytopenia, anaemia, leucopenia, eosinophilia, bone-marrow suppression, myalgia, myopathy, myasthenia, myositis accompanied by increase in creatine kinase (discontinue if raised significantly), blurred vision, exfoliative dermatitis, alopecia, and photosensitivity

**Dose**

- 1.2 g daily; usually in 2 divided doses; range 0.9–1.2 g daily; **CHILD** not recommended

**Gemfibrozil (Non-proprietary) £28.00**

- **Capsules**, gemfibrozil 300 mg, net price 112-cap pack = £35.57. Label: 22
- **Dose** initially 3 capsules daily in divided doses; usual range 2–4 capsules daily; CHILD 4–15 years 1 capsule/20 kg daily

**Supralip® 160 (Abbott) £28.00**

- **Tablets**, f/c, fenofibrate (micronised) 160 mg, net price 28-tab pack = £6.69. Label: 21
- **Dose** 160 mg daily (dose form not appropriate for children or in renal impairment)
Nicotinic acid group

The value of nicotinic acid is limited by its side-effects, especially vasodilatation. In doses of 1.5 to 3 g daily it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol. Nicotinic acid is licensed for use with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol); it can be used alone if the patient is intolerant of statins (for advice on treatment of dyslipidaemia, including use of combination treatment, see p. 161).

A preparation combining laropiprant with nicotinic acid (Tredaptive®) is available; laropiprant has no lipid-regulating effect, but reduces the symptoms of flushing associated with nicotinic acid. Acipimox seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-regulating capabilities.

**ACIPIMOX**

- **Indications** hyperlipidaemias of types Iib and IV in patients who have not responded adequately to diet and other appropriate measures
- **Contra-indications** peptic ulcer
- **Renal impairment** reduce dose if eGFR 30–60 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²
- **Pregnancy** manufacturer advises avoid
- **Breast-feeding** manufacturer advises avoid
- **Side-effects** vasodilatation, flushing, itching, rashes, urticaria, erythema; heartburn, epigastric pain, nausea, diarrhoea, headache, malaise, dry eyes; rarely angioedema, bronchospasm, anaphylaxis
- **Dose**
  - Usually 500–750 mg daily in divided doses

**Omaclor®** (Pfizer) 168

- **Dose** '300’ capsules, white/maroon, gemfibrozil 300 mg, net price 112-cap pack = £35.57. Label: 22
- **Dose** '600’ tablets, I/c, gemfibrozil 600 mg, net price 56-tab pack = £35.57. Label: 22

**Lopid®** (Pfizer) 168

- **Dose** Usually 500–750 mg daily in divided doses

**Nicotinic acid**

- **Indications** adjunct to diet in type IIb or III hypertriglyceridaemia; adjunct to diet in type IV hypertriglyceridaemia; adjunct in secondary prevention in those who have had a myocardial infarction in the preceding 3 months
- **Contra-indications** unstable angina, acute myocardial infarction, diabetes mellitus, gout, history of peptic ulceration; interactions: Appendix 1 (nicotinic acid)
- **Contra-indications** arterial bleeding; active peptic ulcer disease
- **Hepatic impairment** manufacturer advises monitor liver function in mild to moderate impairment and avoid in severe impairment; discontinue if severe abnormalities in liver function tests
- **Renal impairment** manufacturer advises use with caution—no information available
- **Pregnancy** no information available—manufacturer advises avoid unless potential benefit outweighs risk

**OMECA-3-ACID ETHYL ESTERS**

- **Indications** adjunc to diet and statin in type IIb or III hypertriglyceridaemia; adjunc to diet in type IV hypertriglyceridaemia; adjunc in secondary prevention in those who have had a myocardial infarction in the preceding 3 months

**OMEGA-3-ACID ETHYL ESTERS**

- **Indications** present in milk—avoid
- **Side-effects** diarrhoea, nausea, vomiting, abdominal pain, dyspepsia; flushing; pruritus, rash; less commonly tachycardia, palpitation, shortness of breath, peripheral oedema, headache, dizziness, increase in uric acid, hypophosphataemia, prolonged prothrombin time, and reduced platelet count; rarely hypotension, syncope, rhinitis, insomnia, reduced glucose tolerance, myalgia, myopathy, myasthenia; very rarely anorexia, rhabdomyolysis, visual disturbance, and jaundice also reported

**Note** Prostaglandin-mediated symptoms (such as flushing) can be reduced by low initial doses taken with meals or, if patient taking aspirin, aspirin dose should be taken 30 minutes before nicotinic acid

**Dose**

- See under preparation

**Modified release**

**Niaspan®** (Abbott) 168

- **Dose** Tablets, m/r, nicotinic acid 500 mg, net price 56-tab pack = £18.98; 750 mg, 56-tab pack = £28.88; 1 g, 56-tab pack = £38.23; 21-day starter pack of 7 × 375-mg tab with 7 × 500-mg tab and 7 × 750-mg tab = £15.40. Label: 21, 25

**Omacor®** (MSD) 168

- **Dose** 375 mg once daily at night (after a low-fat snack) for 1 week, then 500 mg once daily at night for 1 week, then 750 mg once daily at night for 1 week, then 1 g once daily at night for 4 weeks, increased if necessary in steps of 500 mg at intervals of at least 4 weeks to max. 2 g daily; usual maintenance dose 1–2 g once daily at night

- **With laropiprant**

**Tredaptive®** (MSD) 168

- **Dose** Tablets, m/r, nicotinic acid 1 g, laropiprant 20 mg, net price 28-tab pack = £16.73; 56-tab pack = £33.46. Label: 21, 25

- **Omaclor®** (Pfizer) 168

- **Dose** '600’ tablets, m/r, nicotinic acid 600 mg, net price 56-tab pack = £38.23; 21-day starter pack of 7 × 375-mg tab = £15.10. Label: 21, 25

**Lopid®** (Pfizer) 168

- **Dose** '300’ capsules, white/maroon, gemfibrozil 300 mg, net price 112-cap pack = £35.57. Label: 22

**Breast-feeding** present in milk—avoid

**Side-effects** diarrhoea, nausea, vomiting, abdominal pain, dyspepsia; flushing; pruritus, rash; less commonly tachycardia, palpitation, shortness of breath, peripheral oedema, headache, dizziness, increase in uric acid, hypophosphataemia, prolonged prothrombin time, and reduced platelet count; rarely hypotension, syncope, rhinitis, insomnia, reduced glucose tolerance, myalgia, myopathy, myasthenia; very rarely anorexia, rhabdomyolysis, visual disturbance, and jaundice also reported

**Note** Prostaglandin-mediated symptoms (such as flushing) can be reduced by low initial doses taken with meals or, if patient taking aspirin, aspirin dose should be taken 30 minutes before nicotinic acid

**Dose**

- See under preparation

**Modified release**

**Niaspan®** (Abbott) 168

- **Dose** Tablets, m/r, nicotinic acid 500 mg, net price 56-tab pack = £18.98; 750 mg, 56-tab pack = £28.88; 1 g, 56-tab pack = £38.23; 21-day starter pack of 7 × 375-mg tab with 7 × 500-mg tab and 7 × 750-mg tab = £15.40. Label: 21, 25

**Omacor®** (MSD) 168

- **Dose** 375 mg once daily at night (after a low-fat snack) for 1 week, then 500 mg once daily at night for 1 week, then 750 mg once daily at night for 1 week, then 1 g once daily at night for 4 weeks, increased if necessary in steps of 500 mg at intervals of at least 4 weeks to max. 2 g daily; usual maintenance dose 1–2 g once daily at night

- **With laropiprant**

**Tredaptive®** (MSD) 168

- **Dose** Tablets, m/r, nicotinic acid 1 g, laropiprant 20 mg, net price 28-tab pack = £16.73; 56-tab pack = £33.46. Label: 21, 25

- **Omaclor®** (Pfizer) 168

- **Dose** '600’ tablets, m/r, nicotinic acid 600 mg, net price 56-tab pack = £38.23; 21-day starter pack of 7 × 375-mg tab = £15.10. Label: 21, 25
Cautions haemorrhagic disorders, anticoagulant treatment (bleeding time increased)

Hepatic impairment monitor liver function

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances; less commonly taste disturbances, dizziness, and hypersensitivity reactions; rarely hepatic disorders, headache, hyperglycaemia, acne, and rash; very rarely hypotension, nasal dryness, urticaria, and increased white cell count

Dose

See under preparation below

Omacor® (Abbott Healthcare)
Capsules, 1 g of omega-3-acid ethyl esters 90 containing eicosapentaenoic acid 460 mg and docosahexaenoic acid 380 mg, net price 28-cap pack = £14.24, 100-cap pack = £50.84. Label: 21

Dose hypertriglyceridaemia, initially 2 capsules daily with food, increased if necessary to 4 capsules daily
Secondary prevention after myocardial infarction, 1 capsule daily with food

OMEGA-3-MARINE TRIGLYCERIDES

Indications adjunct in the reduction of plasma triglycerides in severe hypertriglyceridaemia

Cautions haemorrhagic disorders, anticoagulant treatment; aspirin-sensitive asthma; type 2 diabetes

Side-effects occasional nausea and belching

Dose

See under preparations below

Maxepra® (Seven Seas)
Capsules, 1 g (approx. 1.1 mL) concentrated fish oils containing eicosapentaenoic acid 170 mg, docosahexaenoic acid 115 mg. Vitamin A content less than 100 units/g, vitamin D content less than 10 units/g. net price 200-cap pack = £29.28. Label: 21

Dose 5 capsules twice daily with food

Liquid, golden-coloured, concentrated fish oils containing eicosapentaenoic acid 170 mg, docosahexaenoic acid 115 mg/g (1.1 mL). Vitamin A content less than 100 units/g, vitamin D content less than 10 units/g, net price 150 mL = £21.59. Label: 21

Dose 5 mL twice daily with food

SODIUM TETRADECYL SULPHATE

Indications sclerotherapy of varicose veins

Cautions see under Ethanolamine Oleate

Contra-indications see under Ethanolamine Oleate

Side-effects see under Ethanolamine Oleate

Fibro-Vein® (STD Pharmaceutical)
Injection, sodium tetradecyl sulphate 0.2%, net price 5-mL amp = £5.51; 0.5%, 2-mL amp = £2.87; 1%, 2-mL amp = £3.31; 3%, 2-mL amp = £4.07, 5-mL vial = £10.25

Dose by slow injection into empty isolated segment of vein, 0.1–1 mL according to site and condition being treated (consult product literature)

2.13 Local sclerosants

Ethanolamine oleate and sodium tetradecyl sulphate are used in sclerotherapy of varicose veins, and phenol is used in haemorrhoids (section 1.7.3).

ETHANOLAMINE OLEATE
(Monoethanolamine Oleate)

Indications sclerotherapy of varicose veins

Cautions extravasation may cause necrosis of tissues

Contra-indications inability to walk, acute phlebitis, oral contraceptive use, obese legs

Side-effects allergic reactions (including anaphylaxis)
3 Respiratory system

3.1 Bronchodilators

3.1.1 Adrenoceptor agonists

3.1.1.1 Selective beta₂ agonists

3.1.1.2 Other adrenoceptor agonists

3.1.2 Antimuscarinic bronchodilators

3.1.3 Theophylline

3.1.4 Compound bronchodilator preparations

3.1.5 Peak flow meters, inhaler devices and nebulisers

3.2 Corticosteroids

3.3 Cromoglicate and related therapy, leukotriene receptor antagonists, and phosphodiesterase type-4 inhibitors

3.3.1 Cromoglicate and related therapy

3.3.2 Leukotriene receptor antagonists

3.3.3 Phosphodiesterase type-4 inhibitors

3.4 Antihistamines, hyposensitisation, and allergic emergencies

3.4.1 Antihistamines

3.4.2 Allergen Immunotherapy

3.4.3 Allergic emergencies

3.5 Respiratory stimulants and pulmonary surfactants

3.5.1 Respiratory stimulants

3.5.2 Pulmonary surfactants

3.6 Oxygen

3.7 Mucolytics

3.8 Aromatic inhalations

3.9 Cough preparations

3.9.1 Cough suppressants

3.9.2 Demulcent and expectorant cough preparations

3.10 Systemic nasal decongestants

Asthma

Drugs used in the management of asthma include beta₂ agonists (section 3.1.1), antimuscarinic bronchodilators (section 3.1.2), theophylline (section 3.1.3), corticosteroids (section 3.2), cromoglicate and nedocromil (section 3.3.1), leukotriene receptor antagonists (section 3.3.2), and, in specialist centres, omalizumab (section 3.4.2).

For tables outlining the management of chronic and acute asthma, see p. 172 and p. 173. For advice on the management of medical emergencies in dental practice, see p. 27.

Administration of drugs for asthma

Inhalation This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced. See also Inhaler devices, section 3.1.5.

Solutions for nebulisation are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser, usually driven by oxygen in hospital. See also Nebulisers, section 3.1.5.

Oral The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta₂ agonists, corticosteroids, theophylline, and leukotriene receptor antagonists.

Parenteral Drugs such as beta₂, agonists, corticosteroids, and aminophylline can be given by injection in acute severe asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in the community, urgent transfer to hospital should be arranged.

Pregnancy and breast-feeding

It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the fetus. Inhaled drugs, theophylline, and prednisolone (see section 6.3.2) can be taken as normal during pregnancy and breast-feeding. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

Severe acute exacerbations of asthma can have an adverse effect on pregnancy and should be treated...
Management of severe acute asthma

Severe acute asthma can be fatal and must be treated promptly and energetically. All patients with severe acute asthma should be given high-flow oxygen (if available) and an inhaled short-acting beta 2 agonist plus a corticosteroid with a long-acting antimuscarinic bronchodilator. Inhale technique should be checked and regular treatment should be reviewed in accordance with the Management of Chronic Asthma table, p. 172. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future exacerbations. Follow-up within 48 hours should be arranged with the general practitioner or appropriate primary care health professional. Patients should also be reviewed by a respiratory specialist within one month of the exacerbation.

Chronic obstructive pulmonary disease

Smoking cessation (section 4.10.2) reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal vaccine and influenza vaccine, section 14.4).

A trial of a high-dose inhaled corticosteroid or an oral corticosteroid is recommended for patients with moderate or severe airflow obstruction if the diagnosis is in doubt.

Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled short-acting beta, agonist (section 3.1.1.1) or a short-acting antimuscarinic bronchodilator (section 3.1.2) used as required.

When the airways obstruction is more severe, regular inhaled therapy should be used, see also Use of Inhaled Therapies in Chronic Obstructive Pulmonary Disease, p. 174.

If the Forced Expiratory Volume in 1 second (FEV1), is 50% of predicted or more, either a long-acting antimuscarinic bronchodilator (section 3.1.2) or a long-acting beta, agonist (section 3.1.1.1) should be used. Short-acting antimuscarinic bronchodilators should be discontinued when a long-acting antimuscarinic bronchodilator is started. A long-acting beta, agonist with a corticosteroid (section 3.2) in a combination inhaler can be used for patients who remain symptomatic despite regular treatment with a long-acting beta, agonist.

If FEV1 is less than 50% of predicted, either a long-acting antimuscarinic bronchodilator or a long-acting beta, agonist with a corticosteroid in a combination inhaler plus a long-acting antimuscarinic bronchodilator should be used.

In any patient who remains breathless or continues to have exacerbations, triple therapy with a long-acting beta, agonist and a corticosteroid in a combination inhaler plus a long-acting antimuscarinic bronchodilator should be used.

If an inhaled corticosteroid is not appropriate, a long-acting antimuscarinic bronchodilator can be used with a long-acting beta, agonist.

If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline or theophylline (section 3.1.3) can be used.

**Step 4: high-dose inhaled corticosteroid + regular bronchodilators**

Inhaled short-acting beta, agonist as required

- Regular high-dose inhaled corticosteroid
- Inhaled long-acting beta, agonist
- In adults 6-week sequential therapeutic trial of one or more of Leukotriene receptor antagonist
- Modified-release oral theophylline
- Modified-release oral beta, agonist

**Step 5: regular corticosteroids**

Refer to a respiratory specialist

- Inhaled short-acting beta, agonist as required
- Regular high-dose inhaled corticosteroid
- One or more long-acting bronchodilators (see step 4)
- Regular prednisolone tablets (as single daily dose)

Note: In addition to regular prednisolone, continue high-dose inhaled corticosteroid (in exceptional cases may exceed licensed doses); these patients should normally be referred to an asthma clinic

Stepping down

Review treatment every 3 months; if control achieved, stepwise reduction may be possible; reduce dose of inhaled corticosteroid slowly (consider reduction every 3 months, decreasing dose by up to 50% each time)

Advice on the management of chronic asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated June 2009); updates available at www.brit-thoracic.org.uk

1. Standard-dose inhaled corticosteroids
   - Beclometasone dipropionate or budesonide 100–400 micrograms twice daily; CHILD under 12 years 100–200 micrograms twice daily
   - Fluticasone propionate 50–200 micrograms twice daily; CHILD 4–12 years 50–100 micrograms twice daily
   - Mometasone furoate 200 micrograms twice daily
   - Note: Dose adjustments may be required for some inhaler devices, see under individual preparations, section 3.2

2. Alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline, inhaled cromoglicate, or inhaled nedocromil

3. High-dose inhaled corticosteroids
   - Beclometasone dipropionate or budesonide 0.4–1 mg twice daily; CHILD 5–12 years 200–400 micrograms twice daily
   - Fluticasone propionate 200–500 micrograms twice daily; CHILD 5–12 years 100–200 micrograms twice daily
   - Mometasone furoate 200–400 micrograms twice daily
   - Note: Dose adjustments may be required for some inhaler devices, see under individual preparations, section 3.2

4. Lung-function measurements cannot be used to guide management in those under 5 years
Management of acute asthma

**Important** Patients with severe or life-threatening acute asthma may not be distressed and may not have all of these abnormalities; the presence of any should alert the doctor. Regard each emergency consultation as being for severe acute asthma until shown otherwise.

**Treatment**

**Moderate acute asthma**
- Inhaled short-acting beta, agonist via a large-volume spacer or oxygen-driven nebuliser (if available); give 2–10 puffs of salbutamol 100 micrograms/metered inhalation each inhaled separately, and repeat at 10–20 minute intervals if necessary or give nebulised salbutamol 5 mg (CHILD under 5 years 2.5 mg, 5–12 years 2.5–5 mg) or terbutaline 10 mg (CHILD under 5 years 5 mg, 5–12 years 5–10 mg), and repeat at 20–30 minute intervals if necessary
- Prednisolone 40–50 mg by mouth for at least 5 days; CHILD 1–2 mg/kg (max. 40 mg) for up to 3 days, or longer if necessary; if the child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg)

**Severe acute asthma**
- High-flow oxygen (if available)
- Inhaled short-acting beta, agonist via a large-volume spacer or oxygen-driven nebuliser (if available) as for moderate acute asthma
- Prednisolone by mouth as for moderate acute asthma or intravenous hydrocortisone (preferably as sodium succinate) 100 mg every 6 hours until conversion to oral prednisolone is possible; CHILD 4 mg/kg (CHILD under 2 years max. 25 mg, 2–5 years max. 50 mg, 6–12 years max. 100 mg)
- Monitor response for 15–30 minutes
  - If response is poor:
    - Inhaled ipratropium bromide via oxygen-driven nebuliser (if available) 500 micrograms every 4–6 hours (CHILD under 12 years 250 micrograms repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary)
    - Refer those who fail to respond and require ventilatory support to an intensive care or high-dependency unit
  - Consider intravenous beta, agonists, aminophylline (p. 181) or magnesium sulphate [unlicensed indication] (p. 171) only after consultation with senior medical staff
- Consider intravenous aminophylline (p. 181) or magnesium sulphate [unlicensed indication] (p. 171) only after consultation with senior medical staff
- Consider intravenous aminophylline (p. 181) or magnesium sulphate [unlicensed indication] (p. 171) only after consultation with senior medical staff

**Follow up in all cases**
- Monitor symptoms and peak flow. Set up asthma action plan and check inhaler technique
- Review by general practitioner or appropriate primary care health professional within 48 hours, see also p. 171

Advice on the management of acute asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated June 2009); updates available at [www.brit-thoracic.org.uk](http://www.brit-thoracic.org.uk).
Indacaterol (section 3.1.1.1) is a long-acting beta2 agonist licensed for the maintenance treatment of chronic obstructive pulmonary disease. In patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations, roflumilast (section 3.3.3) is licensed as an adjunct to existing bronchodilator treatment. A mucolytic drug (section 3.7) may be considered for a patient with a chronic productive cough.

Long-term oxygen therapy (section 3.6) prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia. During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of oral corticosteroid (section 6.3.2), such as prednisolone 30 mg daily for 7–14 days, should be given if increased breathlessness interferes with daily activities. Antibacterial treatment (Table 1, section 5.1) is required when sputum becomes purulent or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an oxygen alert card (see below) endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation, see also section 3.6.

### Oxygen alert card

Name: ________________________________

I am at risk of type II respiratory failure with a raised CO₂ level.

Please use my ____% Venturi mask to achieve an oxygen saturation of ____% to ____% during exacerbations.

Use compressed air to drive nebulisers (with nasal oxygen at 2 litres/minute). If compressed air not available, limit oxygen-driven nebulisers to 6 minutes.

Oxygen alert card based on British Thoracic Society guideline for emergency oxygen use in adult patients (October 2008); available at www.brit-thoracic.org.uk

### Croup

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone 150 micrograms/kg) by mouth may be of benefit.
BNF 61

More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone 150 micrograms/kg or prednisolone 1–2 mg/kg by mouth, section 6.3.2) should be administered before transfer to hospital. In hospital, dexamethasone 150 micrograms/kg (by mouth or by injection) or budesonide 2 mg (by nebulisation, section 3.2) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline solution 1 in 1000 (1 mg/mL) should be given with close clinical monitoring in a dose of 400 micrograms/kg (max. 5 mg) repeated after 30 minutes if necessary; the effects of nebulised adrenaline last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

### 3.1.1 Adrenoceptor agonists

#### (Sympathomimetics)

**Selective beta, agonists**

The selective beta, agonists (selective beta, adrenoceptor agonists, selective beta, stimulants) (section 3.1.1.1) such as salbutamol or terbutaline are the safest and most effective short-acting beta, agonists for asthma. Less selective beta, agonists such as ephedrine (section 3.1.1.2) should be avoided whenever possible. Adrenaline (epinephrine) (which has both alpha- and beta-adrenoceptor agonist properties) is used in the emergency management of allergic and anaphylactic reactions (section 3.4.3) and in the management of croup (see above).

#### 3.1.1.1 Selective beta, agonists

Selective beta, agonists produce bronchodilation. A short-acting beta, agonist is used for immediate relief of asthma symptoms while some long-acting beta, agonists are added to an inhaled corticosteroid in patients requiring prophylactic treatment.

#### 3.1.1.2 Other adrenoceptor agonists

Management of Chronic Asthma table, see p. 172 Management of Acute Asthma table, see p. 173

**Indacaterol** is a long-acting beta, agonist recently licensed for chronic obstructive pulmonary disease; it is not indicated for the relief of acute bronchospasm.

### CHM advice

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta, agonists (formoterol and salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved. A daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose.

Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta, agonist, see Management of Chronic Asthma table, p. 172.

**Inhalation**

Pressurised-metered dose inhalers are an effective and convenient method of drug administration in mild to moderate asthma. A spacer device (section 3.1.5) may improve drug delivery. At recommended inhaled doses the duration of action of salbutamol, terbutaline and fenoterol is about 3 to 5 hours and for salmeterol and formoterol 12 hours. The dose, the frequency, and the maximum number of inhalations in 24 hours of the beta, agonist should be stated explicitly to the patient. The patient should be advised to seek medical advice when the prescribed dose of beta, agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug such as an inhaled corticosteroid (see Management of Chronic Asthma table, p. 172).

**Short-acting beta, agonists**

Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta, agonist such as salbutamol or terbutaline. If beta, agonist inhalation is needed more often than once daily, prophylactic treatment should be considered, using a stepped approach as outlined in the Management of Chronic Asthma table, p. 172. Regular treatment with an inhaled short-acting beta, agonist is less effective than ‘as required’ inhalation and is not appropriate prophylactic treatment. A short-acting beta, agonist inhaled immediately before exertion reduces exercise-induced asthma; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

**Long-acting beta, agonists** Formoterol (efomefor terol) and salmeterol are longer-acting beta, agonists which are administered by inhalation. They should be used for asthma only in patients who regularly use an inhaled corticosteroid (see CHM advice below). They have a role in the long-term control of chronic asthma (see Management of Chronic Asthma table, p. 172) and they can be useful in nocturnal asthma. Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline. Formoterol is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

Combination inhalers that contain a long-acting beta, agonist and a corticosteroid (section 3.2) ensure that long-acting beta, agonists are not used without concomitant corticosteroids, but reduce the flexibility to adjust the dose of each component.
Nebuliser (or respirator) solutions of salbutamol and terbutaline are used for the treatment of severe acute asthma in hospital or in general practice. Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta, agonists can increase arterial hypoxaemia. For the use of nebulisers in chronic obstructive pulmonary disease, see section 3.1.5. The dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution, see also section 3.1.5.

Oral Oral preparations of beta, agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled beta, agonists are more effective and have fewer side-effects. The longer-acting oral preparations, including bambuterol, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting beta, agonists are usually preferred.

Parenteral Salbutamol or terbutaline can be given intravenously for severe or life-threatening acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of beta, agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. Beta, agonists may also be given by intramuscular injection.

Children Selective beta, agonists are useful even in children under the age of 18 months. They are most effective by the inhaled route; a pressurised metered-dose inhaler should be used with a spacer device in children under 5 years (see NICE guidance, section 3.1.5). A beta, agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled beta, agonist may be used where appropriate (see Management of Chronic Asthma table, p. 172). In severe attacks nebulisation using a selective beta, agonist or iratropium is advisable (see also Management of Chronic Asthma table and Management of Acute Asthma table, p. 172 and p. 173).

Cautions Beta, agonists should be used with caution in hyperthyroidism, cardiovascular disease, arrhythmias, susceptibility to QT-interval prolongation, and hypokalaemia. Beta, agonists should be used with caution in diabetes—monitor blood glucose (risk of ketoacidosis, especially when beta, agonist given intravenously). Interactions: Appendix 1 (sympathomimetics, beta, ).

Hypokalaemia Potentially serious hypokalaemia may result from beta, agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Side-effects Side-effects of the beta, agonists include fine tremor (particularly in the hands), nervous tension, headache, muscle cramps, and palpitation. Other side-effects include tachycardia, arrhythmias, peripheral vasodilatation, myocardial ischaemia, and disturbances of sleep and behaviour. Paradoxical bronchospasm (occasionally severe), urticaria, angioedema, hypotension, and collapse have also been reported. High doses of beta, agonists are associated with hypokalaemia (see Hypokalaemia above).

**BAMBU T EROL HYDROCHLORIDE**

Note: Bambuterol is a pro-drug of terbutaline.

**Indications** asthma and other conditions associated with reversible airways obstruction

**Cautions** see notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** reduce initial dose by half if eGFR less than 50 mL/minute/1.73m²

**Pregnancy** manufacturer advises avoid—no information available; see also p. 170

**Breast-feeding** see p. 170

**Side-effects** see notes above

**Dose**
- 20 mg once daily at bedtime if patient has previously tolerated beta, agonists: other patients, initially 10 mg once daily at bedtime, increased if necessary after 1–2 weeks to 20 mg once daily; **CHILD** not recommended

**BAMBE C (AstraZeneca)**

**Tablets**, both scored, bambuterol hydrochloride 10 mg, net price 28-tab pack = £12.05; 20 mg, 28-tab pack = £13.14

**FENOTEROL HYDROBROMIDE**

**Indications** reversible airways obstruction

**Cautions** see notes above

**Pregnancy** see p. 170

**Breast-feeding** see p. 170

**Side-effects** see notes above

**Compound preparations**

For compound preparation containing fenoterol, see section 3.1.4

**FORMOTEROL FUMARATE**

(Eformoterol fumarate)

**Indications** reversible airways obstruction (including nocturnal asthma and prophylaxis of exercise-induced bronchospasm) in patients requiring long-term regular bronchodilator therapy, see also Management of Chronic Asthma table, p. 172; chronic obstructive pulmonary disease

**Note** For use in asthma only in patients who regularly use an inhaled corticosteroid, see notes above

**Cautions** see notes above

**Pregnancy** see p. 170

**Breast-feeding** see p. 170

**Side-effects** see notes above; very rarely QT-interval prolongation; taste disturbances, nausea, dizziness, rash, and pruritus also reported

**Dose**
- See under preparations below

Counselling: Advise patients not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible

Formoterol (Non-proprietary) **Eformoterol**

**Dry powder for inhalation**, formoterol fumarate 12 micrograms/metered inhalation, net price 120-dose unit = £23.75. Counselling, administration brands include Easyhaler® Formoterol

**Dose** by inhalation of powder, asthma, **ADULT** and **CHILD** over 6 years, 12 micrograms twice daily, increased to 24 micro-
oqrams twice daily in more severe airways obstruction (see also CHM advice below)
Chronic obstructive pulmonary disease, 12 micrograms twice daily

Atimos Modulite® (Chiesi) ▼ (Turbohaler)
Aerosol inhalation, formoterol fumarate 12 micrograms/ metered inhalation, net price 100-dose unit = £30.06. Counselling, administration

Dose by aerosol inhalation, asthma, ADULT and CHILD over 12 years, 12 micrograms twice daily, increased to max. 24 micrograms twice daily in more severe airways obstruction.
Chronic obstructive pulmonary disease, ADULT over 18 years, 12 micrograms twice daily; for symptom relief additional doses may be taken to total max. 48 micrograms daily (max. single dose 24 micrograms)

Foradil® (Novartis) ▼ (Turbohaler)
Dry powder for inhalation, formoterol fumarate 12 micrograms/capsule, net price 60-cap pack (with inhaler device) = £23.38. Counselling, administration

Dose by inhalation of powder, asthma, ADULT and CHILD over 12 years, 12 micrograms twice daily, increased to max. 24 micrograms twice daily in more severe airways obstruction.
CHILD 5–12 years 12 micrograms twice daily
Chronic obstructive pulmonary disease, 12 micrograms twice daily

Oxis® (AstraZeneca) ▼ (Turbohaler)
Turbohaler® (= dry powder inhaler), formoterol fumarate 6 micrograms/metered inhalation, net price 60-dose unit = £24.80; 12 micrograms/metered inhalation, 60-dose unit = £24.80. Counselling, administration

Dose by inhalation of powder, chronic asthma, 6–12 micrograms 1–2 times daily, increased up to 24 micrograms twice daily if necessary; occasionally up to 72 micrograms daily may be needed (max. single dose 36 micrograms); re-assess treatment if additional doses required on more than 2 days a week; CHILD 6–18 years, 6–12 micrograms 1–2 times daily, occasionally up to 48 micrograms daily may be needed (max. single dose 12 micrograms) (see also CHM advice below)
Relief of bronchospasm, ADULT and CHILD over 6 years, 6–12 micrograms
Prophylaxis of exercise-induced bronchospasm, 12 micrograms before exercise; CHILD 6–18 years, 6–12 micrograms before exercise
Chronic obstructive pulmonary disease, 12 micrograms 1–2 times daily; for symptom relief additional doses can be taken to total max. 48 micrograms daily (max. single dose 24 micrograms)

For compound preparations containing formoterol, see section 3.2

INDACATEROL

Indications maintenance treatment of chronic obstructive pulmonary disease
Cautions see notes above; convulsive disorders
Hepatic impairment use with caution in severe impairment—no information available
Pregnancy manufacturer advises use only if potential benefit outweighs risk
Breast-feeding manufacturer advises use only if potential benefit outweighs risks—present in milk in animal studies

Side-effects see notes above; also peripheral oedema, cough, pharyngolaryngeal pain, nasopharyngitis, sinusitis, rhinorrhea; less commonly atrial fibrillation, non-cardiac chest pain, paraesthesia

Dose
By inhalation of powder, ADULT over 18 years, 150 micrograms once daily, increased to max. 300 micrograms once daily

3.1.1 Adrenoceptor agonists

Onbrez Breezhaler® (Novartis) ▼ (Onbrez Breezhaler®)
Inhalation powder, hard capsule (for use with Onbrez Breezhaler® device), indacaterol (as maleate) 150 micrograms, net price 30-cap pack with Onbrez Breezhaler® device = £29.26; 300 micrograms, net price 30-cap pack with Onbrez Breezhaler® device = £29.26. Counselling, administration

Indications asthma and other conditions associated with reversible airways obstruction; premature labour (section 7.1.3)

Cautions see notes above

Pregnancy see p. 170
Breast-feeding see p. 170

Side-effects see notes above; also lactic acidosis with high doses

Dose
By mouth (but use by inhalation preferred), 4 mg (elderly and sensitive patients initially 2 mg) 3–4 times daily; max. single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated); CHILD under 2 years see BNF for Children, 2–6 years 1–2 mg 3–4 times daily; 6–12 years 2 mg 3–4 times daily
By subcutaneous or intramuscular injection, 500 micrograms, repeated every 4 hours if necessary
By slow intravenous injection (but see also Management of Acute Asthma table, p. 173), (dilute to a concentration of 50 micrograms/mL), 250 micrograms, repeated if necessary; CHILD under 18 years see BNF for Children
By intravenous infusion (but see also Management of Acute Asthma table, p. 173), initially 5 micrograms/ minute, adjusted according to response and heart-rate usually in range 3–20 micrograms/minute, or more if necessary; CHILD under 18 years see BNF for Children
By aerosol inhalation (but see also Management of Acute Asthma table, p. 173, or Management of Chronic Asthma table, p. 172), 100–200 micrograms (1–2 puffs); for persistent symptoms up to 4 times daily; CHILD 100 micrograms (1 puff), increased to 200 micrograms (2 puffs) if necessary; for persistent symptoms up to 4 times daily
Prophylaxis of allergen- or exercise-induced bronchospasm, 200 micrograms (2 puffs); CHILD 100 micrograms (1 puff), increased to 200 micrograms (2 puffs) if necessary

By inhalation of powder (but see also Management of Chronic Asthma table, p. 172), 200–400 micrograms; for persistent symptoms up to 4 times daily; CHILD over 5 years 200 micrograms; for persistent symptoms up to 4 times daily (for Asmasal Clickhaler®, Salmulon Novolog®, and Ventolin Accuhaler® doses, see under preparations)

Prophylaxis of allergen- or exercise-induced bronchospasm, 400 micrograms; CHILD 200 micrograms
By inhalation of nebulised solution, ADULT and CHILD over 5 years 2.5–5 mg, repeated up to 4 times daily or more frequently in severe cases; CHILD under 5 years 2.5 mg, repeated up to 4 times daily or more frequently in severe cases; see also Management of Acute Asthma table, p. 173 and Management of Chronic Asthma table, p. 172

SALBUTAMOL (Albuterol)
3 Respiratory system

3.1.1 Adrenoceptor agonists

- **Salmeterol (Non-proprietary)**
  - **Tablets**, salbutamol (as sulphate) 2 mg, net price 28-pack tab = £17.74; 4 mg, 28-tab pack = £16.40
  - **Oral solution**, salbutamol (as sulphate) 2 mg/5 mL, net price 150 mL = £1.55
    - Brands include: Salmep (sugar-free)

- **Ventolin** (Non-proprietary)
  - **Salbutamol** (as sulphate) 178 micrograms/metered inhalation, 100-dose unit = £6.30. Counselling, administration

- **Salmol Easi-Breathe** (IVAX)
  - **Aerosol inhalation**, salbutamol 100 micrograms/metered inhalation, net price 200-dose breath-actuated unit = £6.30. Counselling, administration

- **Salbutin Novolizer** (Meda)
  - **Dry powder for inhalation**, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price refillable 200-dose unit = £4.95; 200-dose refill = £2.75. Counselling, administration

- **Ventolin** (A&H)
  - **Syrup**, sugar-free, salbutamol (as sulphate) 2 mg/5 mL, net price 150 mL = 60p

- **Parenteral**
  - **Ventolin** (A&H)
    - **Injection**, salbutamol (as sulphate) 500 micrograms/mL, net price 1-mL amp = £3.82
    - **Solution for intravenous infusion**, salbutamol (as sulphate) 1 mg/mL. Dilute before use. Net price 5-mL amp = £2.48

- **Inhalation**
  - **Dry powder for inhalation**, salbutamol 100 micrograms/metered inhalation, net price 200-dose unit = £3.19. Counselling, administration
  - **Dry powder inhalation**, salbutamol (as sulphate) 1 mg/mL. Dilute before use. Net price 5-mL amp = £2.48
  - **Dry powder for inhalation**, salbutamol 100 micrograms/metered inhalation, net price 200-dose unit = £3.11; 200 micrograms/metered inhalation, 100-dose unit = £4.85; 200-dose unit = £6.63. Counselling, administration
  - **Nebuliser solution**, salbutamol (as sulphate) 1 mg/mL, net price 20 × 2.5 mL (2.5 mg) = £1.91; 2 mL/mL, 20 × 2.5 mL (5 mg) = £3.82. May be diluted with sterile sodium chloride 0.9%.
  - **Nebuliser solution**, salbutamol (as sulphate) 1 mg/mL, net price 20 × 2.5 mL (2.5 mg) = £1.91; 2 mL/mL, 20 × 2.5 mL (5 mg) = £3.82. May be diluted with sterile sodium chloride 0.9%
  - **Nebuliser solution**, salbutamol (as sulphate) 1 mg/mL, net price 20 × 2.5 mL (2.5 mg) = £1.91; 2 mL/mL, 20 × 2.5 mL (5 mg) = £3.82. May be diluted with sterile sodium chloride 0.9%

- **Compound preparations**
  - For compound preparations containing salbutamol, see section 3.1.4

**Management of Chronic Asthma table**, see p. 172

**Management of Acute Asthma table**, see p. 173
tion; CHILD 5–12 years, 50 micrograms (2 puffs or 1 blister) twice daily
Chronic obstructive pulmonary disease 50 micrograms (2 puffs or 1 blister) twice daily

Counselling Advise patients that salmeterol should not be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible.

**Serevent** (A&H) / Turbohaler® (dry powder for inhalation), disk containing 60 blisters of salmeterol (as xinafoate) 50 micrograms/blister with **Accuhaler** device, net price = £29.26. Counselling, administration

**Evoluhaler® aerosol inhalation** ▼, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £29.26. Counselling, administration

**Diskhaler®** (dry powder for inhalation), disks containing 4 blisters of salmeterol (as xinafoate) 50 micrograms/blister, net price 15 disks with **Diskhaler®** device = £35.79, 15-disk refill = £35.15. Counselling, administration

**Compound preparations**
For compound preparations containing salmeterol, see section 3.2

### TERBUTALINE SULPHATE

**Indications** asthma and other conditions associated with reversible airways obstruction; premature labour (section 7.1.3)

**Cautions** see notes above

**Pregnancy** see p. 170

**Breast-feeding** see p. 170

**Side-effects** see notes above

**Dose**
- **By mouth** (but use by inhalation preferred), initially 2.5 mg 3 times daily for 1–2 weeks, then up to 5 mg 3 times daily; CHILD 1 month–7 years 75 micrograms/kg 3 times daily; 7–15 years 2.5 mg 2–3 times daily
- **By subcutaneous or slow intravenous injection**, 250–500 micrograms up to 4 times daily; CHILD 2–15 years 10 micrograms/kg to a max. of 300 micrograms
- **By continuous intravenous infusion** as a solution containing 3–5 micrograms/mL, 90–300 micrograms/hour for 8–10 hours; CHILD 1 month–18 years, initially 2–4 micrograms/kg as a loading dose, then 1–10 micrograms/kg/hour according to response and heart rate (max. 300 micrograms/hour); high doses with close monitoring
- **By inhalation of powder** (Turbohaler®). ADULT and CHILD over 5 years, 500 micrograms (1 inhalation); for persistent symptoms up to 4 times daily (but see Management of Chronic Asthma table, p. 172)
- **By inhalation of nebulised solution** (but see also Management of Acute Asthma table, p. 173), 5–10 mg 2–4 times daily; additional doses may be necessary in severe acute asthma; CHILD under 5 years 5 mg 2–4 times daily, 5–12 years 5–10 mg 2–4 times daily [unlicensed dose]

**Oral and parenteral**

**Bricanyl®** (AstraZeneca) / Turbohaler® (= dry powder inhaler), terbutaline sulphate 500 micrograms/metered inhalation, net price 100-dose unit = £6.92. Counselling, administration

**Respules®** (= single-dose units for nebulisation), terbutaline sulphate 2.5 mg/mL, net price 20 × 2-mL units (5-mg) = £4.04

### 3.1.2 Other adrenoceptor agonists

Ephedrine is less suitable and less safe for use as a bronchodilator than the selective beta, agonists, because it is more likely to cause arrhythmias and other side-effects; it should be avoided whenever possible.

**Adrenaline (epinephrine) injection** (1 in 1000) is used in the emergency treatment of acute allergic and anaphylactic reactions (section 3.4.3), in angioedema (section 3.4.3), and in cardiopulmonary resuscitation (section 2.7.3). Adrenaline solution (1 in 1000) is used by nebulisation in the management of severe croup (section 3.1).

### EPHEDRINE HYDROCHLORIDE

**Indications** reversible airways obstruction, but see notes above

**Cautions** hyperthyroidism; diabetes mellitus; ischaemic heart disease; hypertension; elderly; prostatic hypertrophy (risk of acute retention); interactions: Appendix 1 (sympathomimetics)

**Renal impairment** use with caution

**Pregnancy** manufacturer advises avoid

**Breast-feeding** present in milk; manufacturer advises avoid—irritability and disturbed sleep reported

**Side-effects** tachycardia; anxiety, restlessness, insomnia; tremor, arrhythmias, dry mouth, and cold extremities also reported

**Dose**
- 15–60 mg 3 times daily; CHILD up to 1 year 7.5 mg 3 times daily, 1–5 years 15 mg 3 times daily, 6–12 years 30 mg 3 times daily
- 1 Ephedrine Hydrochloride (Non-proprietary)

**Tablets**, ephedrine hydrochloride 15 mg, net price 28 = £6.62; 30 mg, 28 = £10.01

1. For exemptions see Medicines, Ethics and Practice, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available)

### 3.1.2 Antimuscarinic bronchodilators

Ipratropium can provide short-term relief in chronic asthma, but short-acting beta, agonists act more quickly and are preferred. Ipratropium by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard
therapy (see Management of Acute Asthma table, p. 175).

The aerosol inhalation of ipratropium can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

**Tiotropium**, a long-acting antimuscarinic bronchodilator, is effective for the management of chronic obstructive pulmonary disease; it is not suitable for the relief of acute bronchospasm.

**Cautions** Antimuscarinic bronchodilators should be used with caution in patients with prostatic hyperplasia, bladder outflow obstruction, and those susceptible to angle-closure glaucoma (see below); **interactions**: Appendix 1 (antimuscarinics).

**Glaucma** Acute angle-closure glaucoma reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta, agonists); care needed to protect patient’s eyes from nebulised drug or from drug powder.

**Side-effects** Dry mouth is the most common side-effect of antimuscarinic bronchodilators; also constipation, cough, paradoxical bronchospasm, headache, dizziness; less commonly nausea, tachycardia, palpitation, atrial fibrillation, urinary retention, angle-closure glaucoma, and blurred vision occur. Raised intra-ocular pressure has occurred rarely.

### IPRATROPIUM BROMIDE

**Indications** reversible airways obstruction, particularly in chronic obstructive pulmonary disease; rhinitis (section 12.2.2)

**Cautions** see notes above

**Pregnancy** see p. 170

**Breast-feeding** see p. 170

**Side-effects** see notes above; also vomiting, diarrhoea, local irritation; rarely laryngospasm, eye pain, mydriasis

**Dose**

- **By aerosol inhalation**, 20–40 micrograms, 3–4 times daily; **CHILD** up to 6 years 20 micrograms 3 times daily, 6–12 years 20–40 micrograms 3 times daily

- **By inhalation of powder**, ADULT and **CHILD** over 12 years, 40 micrograms 3–4 times daily (may be doubled in less responsive patients)

- **By inhalation of nebulised solution**, reversible airways obstruction in chronic obstructive pulmonary disease, 250–500 micrograms 3–4 times daily

  **Acute bronchospasm** (but see also Management of Acute Asthma table, p. 173), 500 micrograms repeated as necessary; **CHILD** under 5 years 125–250 micrograms, max. 1 mg daily; 6–12 years 250 micrograms, max. 1 mg daily

**Counselling** Advise patient not to exceed prescribed dose and to follow manufacturer’s directions

**Ipratropium Bromide** (Non-proprietary name) (A&H)

- **Nebuliser solution**, ipratropium bromide 250 micrograms/mL, net price 20 × 1 mL (250-microgram) unit-dose vials = £4.14, 60 × 1 mL vials = £12.44; 20 × 2 mL vials = £4.87, 60 × 2 mL vials = £14.59. If dilution is necessary use only sterile sodium chloride 0.9%

### TIOTROPIUM

**Indications** maintenance treatment of chronic obstructive pulmonary disease

**Cautions** see notes above; also cardiac rhythm disorders (with Spiriva Respimat)

**Renal impairment** plasma-tiotropium concentration raised; use with caution if eGFR less than 50 mL/minute/1.73 m²

**Side-effects** see notes above; less commonly taste disturbance, stomatitis, gastro-oesophageal reflux disease, pharyngitis, dysphonia, dysphagia, dysuria, epistaxis, oropharyngeal candidiasis; rarely intestinal obstruction (including paralytic ileus), laryngitis, insomnia, urinary-tract infection, skin infection, sinusitis, dental caries, gingivitis, glossitis, skin ulcer; also reported dehydration, joint swelling, dry skin

**Dose**

- See under preparations below

**Spiriva** (Boehringer Ingelheim) (A&H)

- **Inhalation powder, hard capsule** (for use with HandiHaler® device, green, tiotropium (as tiotropium bromide monohydrate) 18 micrograms, net price 30-cap pack with HandiHaler® device = £34.87, 30-cap refill = £31.89. Counselling, administration

**Dose** by inhalation of powder, ADULT over 18 years, 18 micrograms once daily

**Respimat** (sul phate for inhalation) (A&H), tiotropium (as tiotropium bromide monohydrate) 2.5 micrograms/ metered inhalation, net price 60-dose unit = £36.27. Counselling, administration

**Dose** by inhalation, ADULT over 18 years, 5 micrograms (2 puffs) once daily

**Note** The Scottish Medicines Consortium has advised (November 2007) that Spiriva Respimat® is restricted for use in chronic obstructive pulmonary disease in patients who have poor manual dexterity and difficulty using the HandiHaler® device.
3.1.3 Theophylline

Theophylline is a xanthine used as a bronchodilator in asthma (see Management of Chronic Asthma table, p. 172) and stable chronic obstructive pulmonary disease, (see p. 171); it is not generally effective in exacerbations of chronic obstructive pulmonary disease. Theophylline may have an additive effect when used in conjunction with small doses of beta, agonists, the combination may increase the risk of side-effects, including hypokalaemia (see p. 176).

Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, viral infections, in the elderly, and by drugs that inhibit its metabolism. The plasma-theophylline concentration is decreased in smokers, by alcohol consumption, and by drugs that induce its metabolism. For interactions: see Appendix 1 (theophylline).

Differences in the half-life of theophylline are important because the toxic dose is close to the therapeutic dose. In most individuals, satisfactory bronchodilation is associated with a plasma-theophylline concentration of 10–20 mg/litre (see Note below), although a lower plasma-theophylline concentration may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

Theophylline is given by injection as aminophylline, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma, see Management of Acute Asthma table, p. 173. It must be given by very slow intravenous injection (over at least 20 minutes); it is too irritant for intramuscular use. Measurement of plasma-theophylline concentration may be helpful, and is essential if aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.

Caffeine is a xanthine derivative used as a respiratory stimulant in neonatal apnoea, see BNF for Children section 3.5.1.

**THEOPHYLLINE**

**Indications** reversible airways obstruction, severe acute asthma; see also Management of Chronic Asthma table p. 172 and Management of Acute Asthma table p. 173

**Cautions** see notes above, also cardiac disease; hypertension; hyperthyroidism; peptic ulcer; epilepsy; elderly; fever; hypokalaemia risk, see p. 176; avoid in acute porphyria (section 9.8.2); monitor plasma-theophylline concentration (see notes above); dose adjustment may be necessary if smoking started or stopped during treatment

**Hepatic impairment** reduce dose

**Pregnancy** neonatal irritability and apnoea have been reported; see also p. 170

**Breast-feeding** present in milk—irritability in infant reported; modified release preparations preparable; see also p. 170

**Side-effects** nausea, vomiting, gastric irritation, diarrhoea; palpitation, tachycardia, arrhythmias, hypotension; anxiety, dizziness, tremor, headache.

**AMINOPHYLLINE**

**Note** Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water

**Indications** reversible airways obstruction, severe acute asthma

**Cautions** see under Theophylline

**Hepatic impairment** see under Theophylline

**Pregnancy** see under Theophylline

**Breast-feeding** see under Theophylline

**Side-effects** see under Theophylline; also allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis; hypotension, arrhythmias, and convulsions especially if given rapidly by intravenous injection

**Dose**

- See under preparations, below

*Note* Plasma-theophylline concentration for optimum response 10–20 mg/litre (55–110 micromol/litre); measure plasma-theophylline concentration 4–6 hours after dose by
mouth and at least 5 days after starting oral treatment; measure plasma-theophylline concentration 4–6 hours after the start of intravenous infusion; narrow margin between therapeutic and toxic dose, see also notes above

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height

Aminophylline (Non-proprietary)

**Injection**, aminophylline 25 mg/mL, net price 10-mL amp = £0.84

Dose severe acute asthma or acute exacerbation of chronic obstructive pulmonary disease in patients not previously treated with theophylline, by slow intravenous injection over at least 20 minutes (with close monitoring), 250–500 mg (5 mg/kg), then see below; **CHILD** under 12 years 5 mg/kg, then see below.

Severe acute asthma or acute exacerbation of chronic obstructive pulmonary disease by intravenous injection (with close monitoring) 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration.

**Elderly** 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration.

**Note** Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline; plasma-theophylline concentration should be measured in all patients receiving intravenous aminophylline (see note above).

**Modified release**

**Note** Advice about modified-release theophylline preparations (see p. 181) also applies to modified-release aminophylline preparations

Phyllocontin Continus® (Napp)

**Tablets**, m/r, yellow, f/c, aminophylline hydrate 225 mg, net price 56-tab pack = £2.39. Label: 25

Dose **ADULT** and **CHILD** body-weight over 40 kg initially 1 tablet twice daily; increased after 1 week to 2 tablets twice daily according to plasma-theophylline concentration.

**Forte tablets**, m/r, yellow, f/c, aminophylline hydrate 350 mg, net price 56-tab pack = £4.22. Label: 25

Dose initially 1 tablet twice daily; increased after 1 week to 2 tablets twice daily if necessary.

**Note** Phyllocontin Continus®. Forte tablets are for smokers and other patients with shorter theophylline half-life (see notes above).

3.1.4 Compound bronchodilator preparations

In general, patients are best treated with single-ingredient preparations, such as a selective beta 2 agonist (section 3.1.1) or ipratropium bromide (section 3.1.2), so that the dose of each drug can be adjusted. The flexibility is lost with compound bronchodilator preparations. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

For prescribing information, see under individual drugs.

Ipratropium bromide with salbutamol (Non-proprietary)

**Nebuliser solution**, ipratropium bromide 500 micrograms, salbutamol (as sulphate) 2.5 mg/2.5-mL vial, net price 60 unit-dose vials = £23.75.

**Brands** include Salbutrol, Ipramon

Dose bronchospasm in chronic obstructive pulmonary disease, by inhalation of nebulised solution, **ADULT** and **CHILD** over 12 years, 1 vial (2.5 mL) 3–4 times daily.

**Glaucoma** In addition to other potential side-effects acute angle-closure glaucoma has been reported with nebulised ipratropium—

- **for details**, see p. 180

- **Combivent®** (Boehringer Ingelheim) (BNF) | **Nebuliser solution**, isotonlc, ipratropium bromide 500 micrograms, salbutamol (as sulphate) 2.5 mg/2.5-mL vial, net price 60 unit-dose vials = £24.10

Dose bronchospasm in chronic obstructive pulmonary disease, by inhalation of nebulised solution, **ADULT** and **CHILD** over 12 years, 1 vial (2.5 mL) 3–4 times daily.

**Glaucoma** In addition to other potential side-effects acute angle-closure glaucoma has been reported with nebulised ipratropium—

- **for details**, see p. 180

- **Duvovent®** (Boehringer Ingelheim) (BNF) | **Nebuliser solution**, isotonlc, fenoterol hydrobromide 1.25 mg, ipratropium bromide 500 micrograms/4-mL vial, net price 20 unit-dose vials = £8.00

Dose acute severe asthma or acute exacerbation of chronic asthma, by inhalation of nebulised solution, **ADULT** and **CHILD** over 14 years, 1 vial (4 mL), may be repeated up to max. 4 vials in 24 hours.

**Glaucoma** In addition to other potential side-effects acute angle-closure glaucoma has been reported with nebulised ipratropium—

- **for details**, see p. 180

3.1.5 Peak flow meters, inhaler devices and nebulisers

**Peak flow meters**

Measurement of peak flow is particularly helpful for patients who are ‘poor perceivers’ and hence slow to detect deterioration in their asthma, and for those with moderate or severe asthma.

Standard-range peak flow meters are suitable for both adults and children; low-range peak flow meters are appropriate for severely restricted airflow in adults and children. Patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

**Standard Range Peak Flow Meter**

- **AirZone®**, range 60–720 litres/minute, net price = £4.50, replacement mouthpiece = 38p (Clement Clarke).
- **Medi®**, range 60–800 litres/minute, net price = £4.50 (Medicare).
- **MicroPeak®**, range 60–800 litres/minute, net price = £6.50, replacement mouthpiece = 38p (Micro Medical).
- **Mini-Wright**, range 60–800 litres/minute, net price = £6.86, replacement mouthpiece = 38p (Clement Clarke).
- **Personal Best®**, range 60–800 litres/minute, net price = £6.86, replacement mouthpiece = 25p (Respirisons).
- **Piko-1®**, range 15–999 litres/minute, net price = £9.50, replacement mouthpiece = 38p (nSPIRE Health).
- **Pinnacle®**, range 60–990 litres/minute, net price = £6.50 (Fyne Dynamics).
- **Pocketpeak®**, range 60–800 litres/minute, net price = £6.53, replacement mouthpiece = 38p (nSPIRE Health).
- **Vitalograph®**, range 50–800 litres/minute, net price = £4.75 (children’s coloured version also available), replacement mouthpiece = 40p (Vitalograph).

**Note** Readings from new peak flow meters are often lower than those obtained from old Wright-scale peak flow meters and the correct recording chart should be used.

**Low Range Peak Flow Meter**

Compliant to standard EN 23747:2007 except for scale range.

- **Medi®**, range 40–420 litres/minute, net price = £6.50 (Medicare).
Spacer devices are difficult to use. Patients, particularly the elderly and children, find them pressurised metered-dose inhaler effectively, but some dose inhalers. These include Spacer devices remove the need for pressurised metered-dose inhaler. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. Spacer devices (see below) can help such patients because they remove the need to coordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

NICE guidance

Inhaler devices for children with chronic asthma (children under 5 years, August 2000; children 5–15 years, March 2002)

A child's needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered. For children aged under 5 years:

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child’s condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered (but see notes above).

For children aged 5–15 years:

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

Spacers

Spacers

Spacers are used to improve the delivery of inhaled corticosteroids and bronchodilators by reducing the velocity of the aerosol and subsequent impact on the oropharynx and allowing more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacers are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids (see Management of Chronic Asthma table, p. 172), for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (Volumatic®) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacers devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

Use and care of spacer devices

Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month by washing in mild detergent and then allowed to dry in air without rinsing, the mouth-piece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Able Spacer® (Clement Clarke)

Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price standard device = £4.20; with infant, child or adult mask = £6.86

AeroChamber® Plus (GSK)

Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price standard device = £4.53, with mask (blue) = £7.56, infant device (orange) with mask = £7.56, child device (yellow) with mask = £7.56

Babyhaler® (A&H)®

Spacer device, for paediatric use with Flixotide®, and Ventoline® inhalers, net price = £11.34

Haleraid® (A&H)®

Inhalation aid, device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. in arthritis). For use with Flixotide®, Seretide®, Serevent®, and Ventoline® inhalers. Available as Haleraid®-120 for 120-dose inhalers and Haleraid®-200 for 200-dose inhalers, net price = 80p

Nebuchamber® (AstraZeneca)

Spacer device, for use with Palmicort® aerosol inhalers, net price = £8.56

Optichamber® (Respironic)®

Spacer device, for use with all pressurised (aerosol) inhalers, net price = £4.28; with small, medium or large mask = £7.00

PARI Vortex Spacer® (Pari)

Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price with mouthpiece = £8.07; with mask for infant or child = £7.91; with adult mask = £9.97

Pocket Chamber® (nSPIRE Health)

Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price = £4.18; with infant, small, medium, or large mask = £9.75

Volumatic® (A&H)®

Spacer inhaler, large-volume device. For use with Clem Modulite®, Flixotide®, Seretide®, Serevent®, and Ventoline® inhalers, net price = £2.81, with paediatric mask = £2.81
Respiratory system

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:

- a beta, agonist or ipratropium to a patient with an acute exacerbation of asthma or of chronic obstructive pulmonary disease;
- a beta, agonist, corticosteroid, or ipratropium on a regular basis to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistin) or a mucolytic to a patient with cystic fibrosis;
- budesonide or adrenaline to a child with severe croup;
- pentamidine for the prophylaxis and treatment of pneumocystis pneumonia.

The use of nebulisers in chronic persistent asthma and chronic obstructive pulmonary disease should be considered only:

- after a review of the diagnosis;
- after review of therapy (see Management of Chronic Asthma, p. 172 and Chronic Obstructive Pulmonary Disease, p. 171) and the patient’s ability to use hand-held devices;
- after increased doses of inhaled therapy from hand-held inhalers (with a spacer if necessary) have been tried for 2 weeks;
- if the patient remains breathless, despite correctly using optimal therapy.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on standard treatment and up to 2 weeks on nebulised treatment. If prescribed, patients must:

- have clear instructions from a doctor, specialist nurse or pharmacist on the use of the nebuliser (including maintenance and cleaning) and on peak-flow monitoring;
- be instructed not to treat acute attacks at home without also seeking help;
- have regular follow up by a doctor, specialist nurse or physiotherapist after about 1 month and annually thereafter.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on the droplet size, pattern of breath inhalation, and condition of the lung. Droplets with a mass median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma, whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution (antibiotic solutions usually being more viscous).

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients at risk of hypercapnia, such as those with chronic obstructive pulmonary disease, oxygen can be dangerous and the nebuliser should be driven by air (see section 3.1). If oxygen is required, it should be given simultaneously by nasal cannula.

### Tubing

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow; they are not suitable for the nebulisation of some drugs, such as dornase alfa and nebulised suspensions.

### Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

### 3.2 Corticosteroids

Corticosteroids are used for the management of reversible and irreversible airways disease. An inhaled corticosteroid used for 3–4 weeks may help to distinguish asthma from chronic obstructive pulmonary disease; clear improvement over 3–4 weeks suggests asthma.

**Asthma** Corticosteroids are effective in asthma; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway).

An inhaled corticosteroid is used regularly for prophylaxis of asthma when patients require a beta, agonist more than twice a week; or if symptoms disturb sleep more than once a week, or if the patient has suffered exacerbations in the last 2 years requiring a systemic corticosteroid or a nebulised bronchodilator (see Management of Chronic Asthma table, p. 172). **Regular use** of inhaled corticosteroids reduces the risk of exacerbation of asthma.

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3
to 7 days after initiation. Beclometasone dipropionate, budesonide, fluticasone propionate, and mometasone furoate appear to be equally effective. Preparations that combine a corticosteroid with a long-acting beta2 agonist may be helpful for patients stabilised on the individual components in the same proportion.

In adults using an inhaled corticosteroid and a long-acting beta2 agonist, agonist for the prophylaxis of asthma, but who are poorly controlled, (see step 3 of the Management of Chronic Asthma table, p. 172). Symbicort® (budesonide with formoterol) can be used as a reliever (instead of a short-acting beta, agonist), in addition to its regular use for the prophylaxis of asthma. Symbicort® can also be used in this way in adults using an inhaled corticosteroid with a dose greater than beclometasone dipropionate 400 micrograms daily\(^1\), but who are poorly controlled (see step 2 of the Management of Chronic Asthma table, p. 172). When starting this treatment, the total regular daily dose of inhaled corticosteroid should not be reduced. Patients must be carefully instructed on the appropriate dose and management of exacerbations before initiating this therapy, see Symbicort® p. 188. Patients using budesonide with formoterol as a reliever once a day or more should have their treatment reviewed regularly. This management approach is also used by some specialists in children 12–18 years [unlicensed]. It has not been investigated with combination inhalers containing other corticosteroids and long-acting beta, agonists.

High doses of inhaled corticosteroid can be prescribed for patients who respond only partially to standard doses with a long-acting beta2 agonist, agonist or another long-acting bronchodilator (see Management of Chronic Asthma table, p. 172). High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded. However, if a higher dose is required, then it should be initiated and supervised by a specialist. The use of high doses of inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

Systemic corticosteroid therapy may be necessary during episodes of stress, such as severe infection, or if the asthma is worsening, when higher doses are needed and access of inhaled drug to small airways may be reduced; patients may need a reserve supply of corticosteroid tablets.

**Chronic obstructive pulmonary disease** In chronic obstructive pulmonary disease inhaled corticosteroid therapy may reduce exacerbations when given in combination with an inhaled long-acting beta, agonist, see section 3.1. p. 171.

**Cautions of inhaled corticosteroids**

**Paradoxical bronchospasm** The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta, agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

**CFC-free inhalers** Chlorofluorocarbon (CFC) propellants in pressurised aerosol inhalers have been replaced by hydrofluoroalkanes (HFA) propellants.

Doses for corticosteroid CFC-free pressurised metered-dose inhalers may be different from traditional CFC-containing inhalers and may differ between brands, see MHRA/CHM advice below.

For **interactions**: see Appendix 1 (corticosteroids)

**Side-effects of inhaled corticosteroids** Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids (section 6.3.2), but adverse effects have been reported.

High doses of inhaled corticosteroids (see Management of Chronic Asthma table, p. 172) used for prolonged periods can induce adrenal suppression. Inhaled corticosteroids have been associated with adrenal crisis and coma in children; excessive doses should be **avoided**. Patients using high doses of inhaled corticosteroids should be given a ‘steroid card’ (section 6.3.2) and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intermittent illness or an operation.

High doses of inhaled corticosteroids have been associated with lower respiratory tract infections, including pneumonia, in older patients with chronic obstructive pulmonary disease.

Bone mineral density may be reduced following long-term inhalation of higher doses of corticosteroids, predisposing patients to osteoporosis (section 6.6). It is therefore sensible to ensure that the dose of an inhaled corticosteroid is no higher than necessary to keep a patient’s asthma under good control.

In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. However, the height of children receiving prolonged treatment of inhaled corticosteroid should be monitored; if growth is slowed, referral to a paediatrician should be considered. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 5 years (see NICE guidance, section 3.1.5); they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

A small risk of glaucoma with prolonged high doses of inhaled corticosteroids has been reported; cataracts have also been reported with inhaled corticosteroids. Hoarseness and candidiasis of the mouth or throat have been reported, usually only with large doses (see also below). Hypersensitivity reactions (including rash and

---

Respiratory system

3.2 Corticosteroids

Pregnancy see p. 170
Breast-feeding see p. 170
Side-effects see notes above

Dose

- By aerosol inhalation, see Management of Chronic Asthma, p. 172 (important: for Clenil Modulite® and Qvar®, see under preparations)
- By inhalation of dry powder (important: for Asmabec® and Becodisks®, see under preparations), 200–400 micrograms twice daily; adjusted as necessary up to 800 micrograms twice daily; CHILD over 5 years 100–200 micrograms twice daily, adjusted as necessary

Beclometasone (Non-proprietary) (BNF 61)

Dry powder for inhalation, beclometasone dipropionate 100 micrograms/metered inhalation, net price 100-dose unit = £5.36; 200 micrograms/metered inhalation, 100-dose unit = £9.89, 200-dose unit = £14.93; 400 micrograms/metered inhalation, 100-dose unit = £19.61. Label: 8, counselling, administration; also 10 and steroid card with high doses

Brands include: Pulmicort® Beclometasone Dipropionate, Easyhaler® Beclometasone Dipropionate

Inhalation powder, hard capsule (for use with Cyclohaler® device), beclometasone dipropionate 100 micrograms, net price 120-cap pack = £15.99; 200 micrograms, 120-cap pack = £25.00; 400 micrograms, 120-cap pack = £32.25. Label: 8, counselling, administration; also 10 and steroid card with high doses

Brands include: Beclometasone Cyclohalers®

Asmabec Clickhaler® (UCB Pharma) (BNF 61)

Dry powder for inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £6.42; 100 micrograms/metered inhalation, 200-dose unit = £9.43; 250 micrograms/metered inhalation, 100-dose unit = £11.83. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose by inhalation of powder; prophylaxis of asthma, 100–400 micrograms twice daily, adjusted as necessary; max. 4 mg twice daily; CHILD 6–12 years 50–200 micrograms twice daily, adjusted as necessary

Becodisks® (A&H) (BNF 61)

Dry powder for inhalation, disks containing 8 blisters of beclometasone dipropionate 100 micrograms/bister, net price 15 disks with Diskhaler® device = £11.30, 15-disk refill = £10.76; 200 micrograms/bister, 15 disks with Diskhaler® device = £21.54, 15-disk refill = £20.99; 400 micrograms/bister, 15 disks with Diskhaler® device = £42.52, 15-disk refill = £41.98. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose by inhalation of powder; prophylaxis of asthma, 400 micrograms twice daily; CHILD 5–12 years 100–200 micrograms twice daily; CHILD 5–12 years 100–200 micrograms twice daily, adjusted as necessary

Clenil Modulite® (Chiesi) (BNF 61)

Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £3.70; 100 micrograms/metered inhalation = £7.42; 200 micrograms/metered inhalation = £16.17; 250 micrograms/metered inhalation = £16.29.

Angioedema have been reported rarely. Other side-effects that have been reported very rarely include paradoxical bronchospasm, anxiety, depression, sleep disturbances, and behavioural changes including hyperactivity, irritability, and aggression (particularly in children); skin thinning and bruising have also been reported.

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water (or cleaning a child’s teeth) after inhalation of a dose may also be helpful. Antifungal oral suspension or lozenges (section 12.3.2) can be used to treat oral candidiasis without discontinuing therapy.

Oral An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose, see Management of Acute Asthma table, p. 173. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly; tapering is not needed provided that the patient receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid treatment or where oral corticosteroids are required for 3 or more weeks); see also Withdrawal of Corticosteroids, section 6.3.2. In patients who have needed several courses of oral corticosteroids and in whom the possibility of a period on maintenance corticosteroids is being considered, it may be useful to taper the corticosteroid dose gradually to identify a threshold dose for asthma control. This should only be done after other standard options for controlling asthma have been tried (see the Management of Chronic Asthma table, p. 172).

In chronic asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements, see Management of Chronic Asthma, p. 172. Patients taking long-term oral corticosteroids for asthma can often be transferred to an inhaled corticosteroid but the transfer must be slow, with gradual reduction in the dose of the oral corticosteroid, and at a time when the asthma is well controlled.

During an acute exacerbation of chronic obstructive pulmonary disease, prednisolone 30 mg daily should be given for 7–14 days; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone is of no benefit and maintenance treatment is not normally recommended.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to sleep. An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to sleep. Regular peak-flow measurements help to optimise the dose.

Parenteral For the use of hydrocortisone injection in the emergency treatment of acute severe asthma, see Management of Acute Asthma table, p. 173.

Beclometasone Dipropionate (Beclometasone Dipropionate)

Indications prophylaxis of asthma (see also Management of Chronic Asthma, p. 172)

Cautions see notes above

Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £3.70; 100 micrograms/metered inhalation = £7.42; 200 micrograms/metered inhalation = £16.17; 250 micrograms/metered inhalation = £16.29.
Label: 8, counselling, administration; also 10 and steroid card with high doses

**Dose by aerosol inhalation**, 200–400 micrograms twice daily, adjusted as necessary up to 1 mg twice daily; **CHILD** under 12 years 100–200 micrograms twice daily.

**Note** **Clenil Modulite** is not interchangeable with other CFC-free beclometasone dipropionate inhalers; the MHRA has advised (July 2008) that CFC-free beclometasone dipropionate inhalers should be prescribed by brand name, see p. 185

**Dental prescribing on NHS** **Clenil Modulite** 50 micrograms/metered inhalation may be prescribed

**Qvar** (TEVA UK) **BNF 61 3.2 Corticosteroids 187**

**Aerosol inhalation**, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £8.86; 100 micrograms/metered inhalation, 200-dose unit = £17.71. Label: 8, counselling, administration; also 10 and a steroid card with high doses

**Autohaler** (breath-actuated aerosol inhalation), beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £7.87; 100 micrograms/metered inhalation, 200-dose unit = £17.21. Label: 8, counselling, administration; also 10 and steroid card with high doses

**Easy-Breathe** (breath-actuated aerosol inhalation), beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £7.74; 100 micrograms/metered inhalation, 200-dose unit = £16.95. Label: 8, counselling, administration; also 10 and steroid card with high doses

**Dose by aerosol inhalation**, prophylaxis of asthma, **ADULT** and **CHILD** over 12 years, 50–200 micrograms twice daily, increased if necessary to max. 400 micrograms twice daily

**Important** When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100 microgram metered dose of **Qvar** should be prescribed for:

- 200–250 micrograms of beclometasone dipropionate or budesonide
- 100 micrograms of fluticasone propionate

When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of **Qvar** should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of **Qvar** should be adjusted according to response.

**Note** **Qvar** is not interchangeable with other CFC-free beclometasone dipropionate inhalers; the MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name, p. 185

**Compound preparations**

For prescribing information on formoterol fumarate, see section 3.1.1.1

**Fostair** (Chiesi) **BNF 61 3.2 Corticosteroids 187**

**Aerosol inhalation**, beclometasone dipropionate 100 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £29.32. Label: 8, counselling, administration, 10, steroid card with high doses

**Dose by aerosol inhalation**, asthma, **ADULT** over 18 years, 1–2 puffs twice daily; max. 4 puffs daily

When switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, **Fostair** 100/6 can be prescribed for patients already using beclometasone dipropionate 250 micrograms in another CFC-free inhaler; the dose of **Fostair** should be adjusted according to response.

**Note** The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name, see p. 185

**BUDESONIDE**

**Indications** prophylaxis of asthma (see also Management of Chronic Asthma, p. 172); croup

**Cautions** see notes above

**Pregnancy** see p. 170

**Breast-feeding** see p. 170

**Side-effects** see notes above

**Dose**

- See preparations below

**Budesonide** (Non-proprietary) **BNF 61 3.2 Corticosteroids 187**

**Dry powder for inhalation**, budesonide 100 micrograms/metered inhalation, net price 200-dose unit = £8.86; 200 micrograms/metered inhalation, 200-dose unit = £17.71. 400 micrograms/metered inhalation, 100-dose unit = £17.71. Label: 8, counselling, administration; also 10 and steroid card with high doses

**Brands include** Budesonide Cyclohaler®

**Dose by inhalation of powder, ADULT and **CHILD** over 12 years, 100–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening.

**Inhalation powder, hard capsule** (for use with Cyclohaler® device), budesonide 200 micrograms, net price 100-cap pack = £15.48; 400 micrograms, 50-cap pack = £15.48. Label: 8, counselling, administration; also 10 and steroid card with high doses

**Brands include** Budesonide Novolizer®

**Budelin Novolizer** (Meda) **BNF 61 3.2 Corticosteroids 187**

**Dry powder for inhalation**, budesonide 200 micrograms, net price refillable inhaler device and 100-dose cartridge = £14.86; 100-dose refill cartridge = £9.59. Label: 8, counselling, administration; also 10 and steroid card with high doses

**Dose by inhalation of powder, ADULT and **CHILD** over 12 years, 200–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening.

**CHILD** 6–12 years 100–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening.

**Pulmicort** (AstraZeneca) **BNF 61 3.2 Corticosteroids 187**

**Aerosol inhalation**, budesonide 100 micrograms/metered inhalation, net price 120-dose unit = £9.60; 200 micrograms/metered inhalation, 120-dose unit = £13.20. Label: 8, counselling, administration; also 10 and steroid card with high doses

**Dose by aerosol inhalation**, **ADULT** and **CHILD** over 12 years, 100–400 micrograms twice daily, adjusted as necessary; max. 800 micrograms as a single dose in the evening; **CHILD** 6–12 years 200–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening.

**Turbohaler** (= dry powder inhaler), budesonide 100 micrograms/metered inhalation, net price 200-dose unit = £11.84; 400 micrograms/metered inhalation, 50-dose unit = £13.86. Label: 8, counselling, administration; also 10 and steroid card with high doses

**Dose by inhalation of powder, ADULT and **CHILD** over 12 years, 100–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening.

**Respules** (= single-dose units for nebulisation), budesonide 250 micrograms/mL, net price 20 × 2-mL
Respiratory system

FLUTICASONE PROPIONATE

Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 50 micrograms/blister with Accuhaler® device, net price = £6.38; 100 micrograms/blister with Accuhaler® device = £8.93; 250 micrograms/blister with Accuhaler® device = £31.26; 500 micrograms/blister with Accuhaler® device = £36.14. Label: 8, counselling, administration; also label 10 and steroid card with high doses

Note Fluticortide® (A&H) is not indicated for children

Dose
by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily; increased according to severity of asthma; max. 1 mg twice daily (doses above 500 micrograms twice daily initiated by a specialist); CHILD 5–16 years, 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

Evohaler® aerosol inhalation, fluticasone propionate 50 micrograms/metered inhalation, net price 120-dose unit = £5.44; 125 micrograms/metered inhalation, 120-dose unit = £21.28; 250 micrograms/metered inhalation, 120-dose unit = £38.14. Label: 8, counselling, administration; also label 10 and steroid card with high doses

Note Fluticortide® Evohaler is not indicated for children

Dose
by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily; increased according to severity of asthma; max. 1 mg twice daily (doses above 500 micrograms twice daily initiated by a specialist); CHILD 5–16 years, 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

Nebules® (= single-dose units for nebulisation), fluticasone propionate 250 micrograms/mL, net price 10 × 2-mL (500-microgram) unit = £9.34; 1 mg/mL, 10 × 2-mL (2-mg) unit = £37.35. May be diluted with sterile sodium chloride 0.9%. Label: 8, counselling, administration, 10, steroid card

Dose
by inhalation of nebulised suspension, prophylaxis of asthma, ADULT and CHILD over 16 years, 0.5–2 mg twice daily; CHILD 4–16 years, 1 mg twice daily

Note Not suitable for use in ultrasonic nebulisers

Compound preparations
For prescribing information on formoterol fumarate, see section 3.1.1.1

Symbicort® (AstraZeneca) Symbicort 100/6 Turbohaler® (= dry powder inhaler), budesonide 100 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £33.00. Label: 8, counselling, administration

Dose
by inhalation of powder, asthma maintenance therapy, 1–2 puffs twice daily increased if necessary to max. 4 puffs twice daily, reduced to 1 puff once daily if control maintained. CHILD 6–12 years, 1–2 puffs twice daily reduced to 1 puff once daily if control maintained. 12–17 years, 1–2 puffs twice daily reduced to 1 puff once daily if control maintained

Asthma, maintenance and reliever therapy, (but see p. 185) 2 puffs daily in 1–2 divided doses; for relief of symptoms, 1 puff as needed up to max. 6 puffs at a time; max. 8 puffs daily; up to 12 puffs daily can be used for a limited time but medical assessment should be considered; CHILD 12–18 years, see BNF for Children

Symbicort 200/6 Turbohaler® (= dry powder inhaler), budesonide 200 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £38.00. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose
by inhalation of powder, asthma maintenance therapy, 1–2 puffs twice daily increased if necessary to max. 4 puffs twice daily, reduced to 1 puff once daily if control maintained. CHILD 6–12 years, 1–2 puffs twice daily reduced to 1 puff once daily if control maintained

Asthma, maintenance and reliever therapy, (but see p. 185) 2 puffs daily in 1–2 divided doses, for relief of symptoms, 1 puff as needed up to max. 6 puffs at a time; max. 8 puffs daily; up to 12 puffs daily can be used for a limited time but medical assessment should be considered; CHILD 12–18 years, see BNF for Children

Symbicort 400/12 Turbohaler® (= dry powder inhaler), budesonide 400 micrograms, formoterol fumarate 12 micrograms/metered inhalation, net price 60-dose unit = £38.00. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose
by inhalation of powder, asthma maintenance therapy, 1 puff twice daily increased if necessary to max. 2 puffs twice daily, reduced to 1 puff once daily if control maintained. CHILD 6–12 years 1 puff twice daily reduced to 1 puff once daily if control maintained

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second <50% of predicted, 1 puff twice daily

Ciclesonide
Indications
prophylaxis of asthma

Cautions
see notes above

Pregnancy
see p. 170

Breast-feeding
see p. 170

Side-effects
see notes above

Dose

By aerosol inhalation, 160 micrograms daily as a single dose reduced to 80 micrograms daily if control maintained; dose may be increased to max. 320 micrograms twice daily if necessary in severe asthma [unlicensed]. CHILD 12–18 years, 160 micrograms daily as a single dose reduced to 80 micrograms daily if control maintained

Alvesco® (Nycomed) Aerosol inhalation, ciclesonide 80 micrograms/metered inhalation, net price 120-dose unit = £32.83; 160 micrograms/metered inhalation, 60-dose unit = £19.31, 120-dose unit = £38.62. Label: 8, counselling, administration

BNF 61

(500-microgram) unit = £20.02; 500 micrograms/mL, 20 × 2-mL (1-mg) unit = £30.30. May be diluted with sterile sodium chloride 0.9%. Label: 8, counselling, administration, 10, steroid card

Dose
prophylaxis of asthma, by inhalation of nebulised suspension, ADULT and CHILD over 12 years, 1–2 mg twice daily, reduced to 0.5–1 mg twice daily; CHILD 3 months–12 years, 0.5–1 mg twice daily, reduced to 250–500 micrograms twice daily

Croup, by inhalation of nebulised suspension, 2 mg as a single dose (or as two 1-mg doses separated by 30 minutes)

Note Not suitable for use in ultrasonic nebulisers

BNF 61

Accuhaler is not indicated for children

Dose
by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily; increased according to severity of asthma; max. 1 mg twice daily (doses above 500 micrograms twice daily initiated by a specialist); CHILD 5–16 years, 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily
3.3 Cromoglicate and related therapy 189

3.3.1 Cromoglicate and related therapy

The mode of action of sodium cromoglicate and nedocromil is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced. Withdrawal of sodium cromoglicate or nedocromil should be done gradually over a period of one week—symptoms of asthma may recur.

In general, prophylaxis with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations (see Management of Chronic Asthma, p. 172). There is evidence of efficacy of nedocromil in children aged 5–12 years. Sodium cromoglicate and nedocromil are of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be reassessed.

Paradoxical bronchospasm If paradoxical bronchospasm occurs, a short-acting beta, agonist such as salbutamol or terbutaline (section 3.1.1.1) should be used to control symptoms; treatment with sodium cromoglicate or nedocromil should be discontinued.

Side-effects Side-effects associated with inhalation of sodium cromoglicate and nedocromil include throat irritation, cough, bronchospasm (including paradoxical bronchospasm—see above), and headache.

3.3.2 Leukotriene receptor antagonists

MOMETASONE FURFATE

Indications prophylaxis of asthma (see also Management of Chronic Asthma, p. 172)

Cautions see notes above

Pregnancy see p. 170

Breast-feeding see p. 170

Side-effects see notes above; also pharyngitis, headache; less commonly palpitation

Dose

- By inhalation of powder, 200–400 micrograms as a single dose in the evening or in 2 divided doses; dose increased to 400 micrograms twice daily if necessary; CHILD not recommended

Asmanex® (Schering-Plough) ▼ ▼ ▼ ▼

Twisthaler (= dry powder inhaler), mometasone furoate 200 micrograms/metered inhalation, net price 30-dose unit = £15.70, 60-dose unit = £23.54; 400 micrograms/metered inhalation, 30-dose unit = £21.78, 60-dose unit = £36.05. Label: 8, counselling, administration, 10, steroid card

Note The Scottish Medicines Consortium has advised (November 2003) that Asmanex® is restricted for use following failure of first-line inhaled corticosteroids
The leukotriene receptor antagonists, montelukast and zafirlukast, block the effects of cysteinyl leukotrienes in the airways. They are effective in asthma when used alone or with an inhaled corticosteroid (see Management of Chronic Asthma table, p. 172). Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

Churg-Strauss syndrome has occurred very rarely in association with the use of leukotriene receptor antagonists; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

Pregnancy

There is limited evidence for the safe use of leukotriene receptor antagonists during pregnancy; however, they can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant, see also p. 170.

**3.3.2 Leukotriene receptor antagonists**

**SODIUM CROMOGLICATE**

(Sodium Cromoglycate)

**Indications**
prophylaxis of asthma (see also Management of Chronic Asthma table, p. 172); food allergy (section 1.5.4); allergic conjunctivitis (section 11.4.2); allergic rhinitis (section 12.2.1)

**Cautions**
see notes above; also discontinue if eosinophilic pneumonia occurs

**Pregnancy**
see p. 170

**Breast-feeding**
see p. 170

**Side-effects**
see notes above; also rhinitis; very rarely eosinophilic pneumonia

**Dose**
- By aerosol inhalation, ADULT over 5 years, 10 mg (2 puffs) 4 times daily, increased if necessary to 6–8 times daily, or additional dose may also be taken before exercise; maintenance, 5 mg (1 puff) 4 times daily

**Intal® CFC-Free Inhaler** (Sanofi-Aventis)

Aerosol inhalation, sodium cromoglicate 5 mg/ metered inhalation, net price 112-dose unit = £14.84. Label: 8, counselling, administration

**NEDOCROMIL SODIUM**

**Indications**
prophylaxis of asthma (see also Management of Chronic Asthma table, p. 172)

**Cautions**
see notes above

**Pregnancy**
see p. 170

**Breast-feeding**
see p. 170

**Side-effects**
see notes above; also nausea, vomiting, dyspepsia, abdominal pain, pharyngitis; rarely taste disturbances

**Dose**
- By aerosol inhalation, ADULT and CHILD over 6 years 4 mg (2 puffs) 4 times daily when control achieved may be possible to reduce to twice daily

**Monoject CFC-Free Inhaler** (Sanofi-Aventis)

Aerosol inhalation, mint-flavoured, nedocromil sodium 2 mg/metered inhalation, net price 112-dose unit = £39.94. Label: 8, counselling, administration

**MONTELUKAST**

**Indications**
prophylaxis of asthma, see notes above and Management of Chronic Asthma table, p. 172; symptomatic relief of seasonal allergic rhinitis in patients with asthma

**Cautions**
interactions: Appendix 1 (leukotriene receptor antagonists)

**Pregnancy**
manufacturer advises avoid unless essential, see also notes above

**Breast-feeding**
manufacturer advises avoid unless essential

**Side-effects**
abdominal pain, thirst; hyperkinesia (in young children), headache; very rarely Churg-Strauss syndrome (see notes above); dry mouth, diarrhoea, dyspepsia, nausea, vomiting, hepatic disorders, palpititation, oedema, increased bleeding, epistaxis, hypersensitivity reactions (including anaphylaxis, angiooedema, and skin reactions), respiratory infections, depression, suicidal thoughts and behaviour, tremor, asthenia, dizziness, hallucinations, parasthesia, hypoaesthesia, sleep disturbances, sleepwalking, abnormal dreams, agitation, anxiety, aggression, seizures, pyrexia, arthralgia, and myalgia, also reported

**Dose**
- Prophylaxis of asthma, ADULT and CHILD over 15 years, 10 mg once daily in the evening; CHILD 6 months–6 years 4 mg once daily in the evening, 6–15 years 5 mg once daily in the evening
- Seasonal allergic rhinitis, ADULT and CHILD over 15 years, 10 mg once daily in the evening

**SINGULAR® (MSD)**

**Chewable tablets**
pink, cherry-flavoured, montelukast (as sodium salt) 4 mg, net price 28-tab pack = £25.69; 5 mg, 28-tab pack = £25.69. Label: 23, 24

**Exipients**
include aspartame equivalent to phenylalanine 674 micrograms/4-mg tablet and 842 micrograms/5-mg tablet (section 9.4.1)

**Granules**
montelukast (as sodium salt) 4 mg, net price 28-sachet pack = £25.69. Counselling, administration

**Counselling**
Granules may be swallowed or mixed with cold food (but not fluid) and taken immediately

**Tablets**
beige, f/c, montelukast (as sodium salt) 10 mg, net price 28-tab pack = £26.97

**Note**
The Scottish Medicines Consortium has advised (June 2007) that Singular® chewable tablets and granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singular® chewable tablets and granules should be initiated by a specialist in paediatric asthma.
3.3.3 Phosphodiesterase type-4 inhibitors

Rofumilast is a phosphodiesterase type-4 inhibitor with anti-inflammatory properties; it is licensed as an adjunct to bronchodilators for the maintenance treatment of patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations.

**ROFLUMILAST**

**Indications** see notes above

**Contra-indications** severe immunological disease; severe acute infectious disease; cancer (except basal cell carcinoma); concomitant treatment with immunosuppressive drugs (except short-term systemic corticosteroids)

**Hepatic impairment** caution in mild impairment; avoid in moderate to severe impairment

**Pregnancy** manufacturer advises avoid—presence in milk and antidepressants, headache, insomnia.

**Breast-feeding** manufacturer advises avoid—presence in milk and antidepressants, headache, insomnia.

**Side-effects** gastrointestinal disturbances, respiratory infections, headache, insomnia; rarely bleeding disorders, hypersensitivity reactions including angioedema and skin reactions, arthralgia, myalgia, hepatitis, hyperbilirubinaemia, thrombocytopenia; very rarely Churg-Strauss syndrome (see notes above), agranulocytosis

**Dose**
- **ADULT** over 18 years, 500 micrograms once daily
- **CHILD** over 12 years, 20 mg twice daily

**Accolate** (AstraZeneca) Tablets, f/c, roflumilast 20 mg, net price 56-tab pack = £17.75. Label: 23

**Counselling** Patients should be given a patient card before starting treatment and advised to record body-weight at regular intervals.
antihistamines because they penetrate the blood brain barrier only to a slight extent.

Cautions and contra-indications Sedating antihistamines have significant antimuscarinic activity and they should therefore be used with caution in prostatic hyper trophy, urinary retention, susceptibility to angle-closure glaucoma, and pyloroduodenal obstruction. Caution may be required in epilepsy. Children and the elderly are more susceptible to side-effects. Many antihistamines should be avoided in acute porphyria but some are thought to be safe, see section 9.6.2. Interactions: Appendix 1 (antihistamines).

Hepatic impairment Sedating antihistamines should be avoided in severe liver disease—increased risk of coma.

Pregnancy Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity except for hydroxyzine where toxicity has been reported with high doses in animal studies. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

Breast-feeding Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

Side-effects Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines (see also notes above). Side-effects that are more common with the older antihistamines include headache, psychomotor impairment, and antimuscarinic effects such as urinary retention, dry mouth, blurred vision, and gastro-intestinal disturbances. Other rare side-effects of antihistamines include hypotension, palpitation, arrhythmias, extrapyramidal effects, dizziness, confusion, depression, sleep disturbances, tremor, convulsions, hypersensitivity reactions (including bronchospasam, angioedema, and anaphylaxis, rashes, and photosensitivity reactions), blood disorders, liver dysfunction, and angle-closure glaucoma.

Non-sedating antihistamines

Driving Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. driving); excess alcohol should be avoided.

ACRIVASTINE

Indications symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

Cautions see notes above

Contra-indications see notes above; also hypersensitivity to triprolidine; elderly

Renal impairment avoid in severe impairment

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

• ADULT and CHILD over 12 years, 8 mg 3 times daily

Acrivastine (Non-proprietary)

Capsules, acrivastine 8 mg, net price 12-cap pack = £2.59, 24-cap pack = £4.49. Counselling, driving

Brands include Benadryl® Allergy Relief

CETIRIZINE HYDROCHLORIDE

Indications symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

Cautions see notes above

Contra-indications see notes above

Renal impairment use half normal dose if eGFR 30–50 mL/minute/1.73 m²; use half normal dose and reduce dose frequency to alternate days if eGFR 10–30 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

• ADULT and CHILD over 12 years, 10 mg once daily; CHILD 1–2 years see BNF for Children, 2–6 years 2.5 mg twice daily, 6–12 years 5 mg twice daily

Cetirizine (Non-proprietary)

Tablets, cetirizine hydrochloride 10 mg, net price 30-tab pack = 95p. Counselling, driving

Dental prescribing on NHS Cetirizine 10 mg tablets may be prescribed

Oral solution, cetirizine hydrochloride 5 mg/5 mL, net price 200 mL = £2.03. Counselling, driving

Note Sugar-free versions are available and can be ordered by specifying sugar-free on the prescription

Excipients may include propylene glycol (see Excipients, p. 2)

DESLORATADINE

Note Desloratadine is a metabolite of loratadine

Indications symptomatic relief of allergic rhinitis and urticaria

Cautions see notes above

Contra-indications see notes above; also hypersensitivity to loratadine

Renal impairment use with caution in severe impairment

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; rarely myalgia; very rarely hallucinations

Dose

• 5 mg once daily; CHILD 1–6 years 1.25 mg once daily, 6–12 years 2.5 mg once daily

Neoclaritin® (Schering-Plough) (c)

Tablets, blue, f/c, desloratadine 5 mg, net price 30-tab pack = £6.77. Counselling, driving

Oral solution, desloratadine 2.5 mg/5 mL, net price 100 mL (bubblegum-flavour) = £6.77, 150 mL = £10.15. Counselling, driving

Excipients include propylene glycol (see Excipients, p. 2)

FEXOFENADINE HYDROCHLORIDE

Note Fexofenadine is a metabolite of terfenadine

Indications see under Dose

Cautions see notes above

Contra-indications see notes above
### MIZOLASTINE

**Indications**  
Symptomatic relief of allergy such as hay fever, urticaria

**Cautions**  
See notes above

**Contra-Indications**  
See notes above; also susceptibility to QT-interval prolongation (including cardiac disease and hypokalaemia); elderly

**Hepatic impairment**  
Manufacturer advises avoid—no information available

**Pregnancy**  
See notes above

**Breast-feeding**  
See notes above

**Side-effects**  
See notes above; weight gain; anxiety, asthenia; less commonly arthralgia and myalgia

**Dose**  
- **ADULT** and **CHILD** over 12 years, 10 mg once daily

### RUPATADINE

**Indications**  
Symptomatic relief of allergic rhinitis, chronic idiopathic urticaria

**Cautions**  
See notes above; also susceptibility to QT-interval prolongation (including cardiac disease and hypokalaemia); elderly

**Hepatic impairment**  
Manufacturer advises avoid in significant impairment

**Pregnancy**  
See notes above

**Breast-feeding**  
See notes above

**Side-effects**  
See notes above; also susceptibility to QT-interval prolongation (including cardiac disease and hypokalaemia)

**Dose**  
- **ADULT** and **CHILD** over 12 years, 10 mg once daily

### Sedating antihistamines

**Driving**  
Drowsiness may affect performance of skilled tasks (e.g. driving); sedating effects enhanced by alcohol.

### ALIMEMAZINE TARTRATE

**Indications**  
Urticaria and pruritus, premedication

**Cautions**  
See notes above; see also section 4.2.1

**Contra-Indications**  
See notes above; see also section 4.2.1

**Hepatic impairment**  
See notes above

**Renal impairment**  
Avoid

**Pregnancy**  
See notes above

**Breast-feeding**  
See notes above

**Side-effects**  
See notes above; see also section 4.2.1

**Dose**  
- Urticaria and pruritus, 10 mg 2–3 times daily, in severe cases up to max. 100 mg daily has been used; **ELDERLY** 10 mg 1–2 times daily; **CHILD** under 2 years, see
3.4.1 Antihistamines

**CHLORPHENAMINE MALEATE**
(Chlorpheniramine maleate)

**Indications**  symptomatic relief of allergy such as hay fever, urticaria; emergency treatment of anaphylactic reactions (section 3.4.3)

**Cautions**  see notes above

**Contra-indications**  see notes above

**Pregnancy**  see notes above

**Hepatic impairment**  reduce daily dose by one-third;

**Contra-indications**  see notes above

**Cautions**  see notes above

**Indications**  symptomatic relief of allergy such as hay fever

**Breast-feeding**  see notes above

**Side-effects**  see notes above

**Dose**  
• By mouth, 4 mg every 4–6 hours, max. 24 mg daily (ELDERLY max. 12 mg daily); CHILD under 1 year see **BNF for Children**, 1–2 years 1 mg twice daily; 2–6 years 1 mg every 4–6 hours, max. 6 mg daily; 6–12 years 2 mg every 2–4 hours, max. 12 mg daily.

• By intramuscular injection or by intravenous injection over 1 minute, 10 mg, repeated if required up to max. 4 doses in 24 hours; CHILD under 6 months 250 micrograms/kg (max. 2.5 mg); 6 months–6 years 2.5 mg; 6–12 years 5 mg; these doses may be repeated if required up to max. 4 doses in 24 hours.

**Chlorphenamine**  (Non-proprietary)

**Tablets**, chlorphenamine maleate 4 mg, net price 28-tab pack = £4.28. Label: 2

**Syrup**, alimemazine tartrate 10 mg, net price 100 mL = £6.83; 30 mg/5 mL, 100 mL = £7.55. Label: 2

**CYPROHEPTADINE HYDROCHLORIDE**

**Indications**  symptomatic relief of allergy such as hay fever, urticaria

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Pregnancy**  see notes above

**Renal impairment**  reduce daily dose by half

**Contra-indications**  see notes above

**Cautions**  see notes above

**Indications**  pruritus

**Breast-feeding**  manufacturer advises avoid; see also notes above

**Side-effects**  see notes above

**Dose**  
• Pruritus, initially 25 mg at night increased if necessary to 25 mg 3–4 times daily; CHILD 1–6 years initially 5–15 mg at night increased if necessary to 50 mg daily in 3–4 divided doses; 6–12 years initially 15–25 mg at night increased if necessary to 50–100 mg daily in 2–4 divided doses; CHILD under 1 year see **BNF for Children**.

**Piriton**  (GSK Consumer Healthcare)

**Tablets**, yellow, scored, chlorphenamine maleate 4 mg, net price 25-tab pack = £1.22. Label: 2

**Oral solution**, chlorphenamine maleate 2 mg/5 mL, net price 150 mL = £2.51. Label: 2

1. **Note**  In the United Kingdom, a prescription is required for this medicine.

2. **Label**  2

3. **Price**  2

**Tavegil**  (Novartis Consumer Health)

**Tablets**, scored, clemastine (as hydrogen fumarate) 1 mg. Net price 60-tab pack = £2.35. Label: 2

**HYDROXYZINE HYDROCHLORIDE**

**Indications**  pruritus

**Cautions**  see notes above; also susceptibility to QT-interval prolongation

**Contra-indications**  see notes above

**Hepatic impairment**  reduce daily dose by one-third;

**Renal impairment**  reduce daily dose by half

**Pregnancy**  toxicity in animal studies with high doses; see also notes above

**Breast-feeding**  manufacturer advises avoid; see also notes above

**Side-effects**  see notes above

**Dose**  
• Allergy, usual dose 4 mg 3–4 times daily; usual range 4–20 mg daily, max. 32 mg daily; INFANT under 2 years not recommended, CHILD 2–6 years 2 mg 2–3 times daily, max. 12 mg daily; 7–14 years 4 mg 2–3 times daily, max. 16 mg daily.

**Periactin**  (MSD)

**Tablets**, scored, cyproheptadine hydrochloride 4 mg, net price 30-tab pack = 86p. Label: 2

**Atarax**  (Alliance)

**Tablets**, both f/c, hydroxyzine hydrochloride 10 mg (orange), net price 84-tab pack = £2.18; 25 mg (green), 28-tab pack = £1.17. Label: 2

**Ucerax**  (UCB Pharma)

**Tablets**, both f/c, scored, hydroxyzine hydrochloride 25 mg, net price 25-tab pack = £1.01. Label: 2

**Oral solution**, hydroxyzine hydrochloride 10 mg/5 mL, net price 200-mL pack = £1.78. Label: 2

**CLEMASTINE**

**Indications**  symptomatic relief of allergy such as hay fever, urticaria

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see notes above

**Dose**  
• 1 mg twice daily, increased up to 6 mg daily if required; INFANT under 1 year not recommended, CHILD 1–3 years 250–500 micrograms twice daily; 3–6 years 500 micrograms twice daily; 6–12 years 0.5–1 mg twice daily.
### 3.4.2 Allergen Immunotherapy

**Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (Grazax®) is also licensed for grass pollen-induced rhinitis and conjunctivitis.** Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- **seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;**
- **hypersensitivity to wasp and bee venom.**

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

### KETOTIFEN

**Indications** allergic rhinitis

**Cautions** see notes above

**Contra-indications**see notes above

**Hepatic impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also excitation, irritability, nervousness; less commonly cystitis; rarely weight gain; very rarely Stevens-Johnson syndrome

**Dose**

- **By mouth**
  - CHILD 0–1 year, 0.25 mg twice daily; 1–5 years, 0.5 mg twice daily; 5–10 years, 1 mg twice daily

- **By slow intravenous injection**
  - CHILD 3 years and over, 1 mg twice daily

- **By deep intramuscular injection**
  - CHILD 2–5 years, 5–10 years 6.25–12.5 mg

- **By subcutaneous injection**
  - CHILD 3 years and over, 50 mg

**Zaditen®** (Swedish Orphan)

- **Tablets,** scored, ketotifen (as hydrogen fumarate) 1 mg, net price 60-tab pack = £7.53. Label: 2, 21
- **Elixir,** ketotifen (as hydrogen fumarate), 1 mg/5 mL, net price 300 mL (strawberry-flavoured) = £8.91. Label: 2, 21

### PROMETHAZINE HYDROCHLORIDE

**Indications** symptomatic relief of allergy such as hay fever and urticaria; emergency treatment of anaphylactic reactions; sedation (section 4.1.1); nausea and vomiting (section 4.6)

**Cautions** see notes above; avoid extravasation with intravenous injection; severe coronary artery disease

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also restlessness; intramuscular injection may be painful

**Dose**

- **By mouth**
  - CHILD 0–1 year, 0.5–1 mg at night; 1–5 years, 2 mg twice daily; initial treatment in readily sedated patients 0.5–1 mg at night; CHILD 3 years and over, 1 mg twice daily

- **By slow intravenous injection**
  - CHILD 3 years and over, 100 mg;
  - CHILD 2–5 years, 25–50 mg; max.
  - CHILD 5–10 years, 25 mg daily in 1–2 divided doses
  - CHILD 11 years and over, 5–10 mg daily in 1–2 divided doses

- **By deep intramuscular injection**
  - CHILD 5–10 years 6.25–12.5 mg

- **By slow intravenous injection in emergencies**
  - CHILD 5–10 years 25–50 mg as a solution containing 2.5 mg/mL in water for injections; max. 100 mg

**Promethazine** (Non-proprietary)

- **Tablets,** scored, promethazine hydrochloride 25 mg/mL, net price 1-mL amp = 68p, 2-mL amp = £1.20

#### Promethazine Hydrochloride Oral Solution 5 mg/5 mL

- **Tablets,** scored, promethazine hydrochloride 25 mg/mL, net price 56-tab pack = £2.85; 25 mg, 56-tab pack = £4.34. Label: 2

#### Promethazine Hydrochloride Oral Solution 10 mg, net price 56-tab pack = £7.53. Label: 2

**Phenergan®** (Sanofi-Aventis)

- **Tablets,** both blue, f/c, promethazine hydrochloride 10 mg, net price 56-tab pack = £2.85; 25 mg, 56-tab pack = £4.34. Label: 2

**Dental prescribing on NHS** May be prescribed as Promethazine Hydrochloride Tablets 10 mg or 25 mg

- **Elixir,** golden, promethazine hydrochloride 5 mg/5 mL, net price 100 mL = £2.67. Label: 2

**Dental prescribing on NHS** May be prescribed as Promethazine Hydrochloride Oral Solution 5 mg/5 mL

**Injection** (Swedish Orphan), promethazine hydrochloride 25 mg/mL, net price 1-mL amp = £1.20

- **Tablets,** scored, promethazine hydrochloride 25 mg/mL, net price 56-tab pack = £2.85; 25 mg, 56-tab pack = £4.34. Label: 2

- **Elixir,** golden, promethazine hydrochloride 5 mg/5 mL, net price 100 mL = £2.67. Label: 2

**Dental prescribing on NHS** May be prescribed as Promethazine Hydrochloride Oral Solution 5 mg/5 mL

**Injection** (Swedish Orphan), promethazine hydrochloride 25 mg/mL, net price 1-mL amp = £1.20

**Dental prescribing on NHS** May be prescribed as Promethazine Hydrochloride Oral Solution 5 mg/5 mL

**Injection** (Swedish Orphan), promethazine hydrochloride 25 mg/mL, net price 1-mL amp = £1.20

**Patients** undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

### BEE AND WASP ALLERGEN EXTRACTS

**Indications** hypersensitivity to wasp or bee venom (see notes above)

**Cautions** see notes above and consult product literature

**Contra-indications** see notes above and consult product literature

**Pregnancy** avoid

**Side-effects** consult product literature

**Dose**

- **By subcutaneous injection,** consult product literature
Respiratory system

beta2 agonist. Omalizumab should be initiated by high-dose inhaled corticosteroid together with a long-acting beta2 agonist in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high-dose inhaled corticosteroids and long-acting beta2 agonists in addition to leukotriene receptor antagonists, theophylline, oral corticosteroids, oral beta2 agonists, and smoking cessation where clinically appropriate. The following conditions apply:

- confirmation of IgE-mediated allergy to a perennial allergen by clinical history and allergy skin testing;
- either 2 or more severe exacerbations of asthma requiring hospital admission within the previous year, or 3 or more severe exacerbations of asthma within the previous year, at least one of which required hospital admission, and a further 2 which required treatment or monitoring in excess of the patient’s usual regimen, in an accident and emergency unit.

Omalizumab should be initiated and monitored by a physician experienced in both allergy and respiratory medicine in a specialist centre, and discontinued at 16 weeks in patients who have not shown an adequate response to therapy.

**GRASS AND TREE POLLEN EXTRACTS**

**Indications** treatment of seasonal allergic hay fever due to grass or tree pollen in patients who have failed to respond to anti-allergy drugs (see notes above)

**Cautions** see notes above and consult product literature

**Contra-indications** see notes above and consult product literature

**Pregnancy** avoid

**Side-effects** see notes above and consult product literature

**Dose**

- See under preparations below

**Pollinex® (Allergy)** (ALK-Abello)

Grasses and rye or tree pollen extract, net price initial treatment set (3 vials) and extension course treatment (1 vial) = £450.00

**Dose** By subcutaneous injection, consult product literature

**Grass pollen extract**

**Grazax® (ALK-Abello)** (ALK-Abello)

Oral lycophilisates (= freeze-dried tablets), grass pollen extract 75 000 units, net price 30-tab pack = £66.56. Counselling, administration

**Dose**

- ADULT over 5 years, 1 tablet daily; start treatment at least 4 months before start of pollen season and continue for up to 3 years

- CHILD over 5 years, 1 tablet daily; start treatment with omalizumab or sometimes more than 24 hours after the first injection.

- For details on the management of anaphylaxis, see section 3.4.3.1

The Scottish Medicines Consortium p. 4 has advised (September 2007 and March 2010) that omalizumab is accepted for restricted use within NHS Scotland as add-on therapy to improve asthma control in children (6 to 12 years), adolescents, and adults with severe persistent allergic asthma. Omalizumab is restricted to patients who are prescribed chronic systemic corticosteroids and in whom all other treatments have failed. The response should be assessed at 16 weeks and omalizumab treatment discontinued in patients who have not shown a marked improvement in overall asthma control.

**OMALIZUMAB**

Omalizumab is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high-dose inhaled corticosteroid together with a long-acting beta2 agonist, omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma.

Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy. Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

For details on the management of anaphylaxis, see section 3.4.3.

The Scottish Medicines Consortium p. 4 has advised (September 2007 and March 2010) that omalizumab is accepted for restricted use within NHS Scotland as add-on therapy to improve asthma control in children (6 to 12 years), adolescents, and adults with severe persistent allergic asthma. Omalizumab is restricted to patients who are prescribed chronic systemic corticosteroids and in whom all other treatments have failed. The response should be assessed at 16 weeks and omalizumab treatment discontinued in patients who have not shown a marked improvement in overall asthma control.

**NICE guidance**

**Omalizumab for severe persistent allergic asthma (November 2007)**

Omalizumab is recommended as additional therapy for the prophylaxis of severe persistent allergic asthma in adults and children over 12 years, who cannot be controlled adequately with high-dose inhaled corticosteroids and long-acting beta2 agonists in addition to leukotriene receptor antagonists, theophylline, oral corticosteroids, oral beta2 agonists, and smoking cessation where clinically appropriate. The following conditions apply:

- confirmation of IgE-mediated allergy to a perennial allergen by clinical history and allergy skin testing;
- either 2 or more severe exacerbations of asthma requiring hospital admission within the previous year, or 3 or more severe exacerbations of asthma within the previous year, at least one of which required hospital admission, and a further 2 which required treatment or monitoring in excess of the patient’s usual regimen, in an accident and emergency unit.

Omalizumab should be initiated and monitored by a physician experienced in both allergy and respiratory medicine in a specialist centre, and discontinued at 16 weeks in patients who have not shown an adequate response to therapy.

**OMALIZUMAB**

**Indications** prophylaxis of allergic asthma (see notes above)

**Cautions** autoimmune disease; susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies
### Side-effects
- Headache; injection-site reactions; less commonly, nausea, diarrhoea, dyspepsia, flushing, fatigue, dizziness, drowsiness, paraesthesia, influenza-like symptoms, photosensitivity, hypersensitivity reactions (including hypotension, bronchospasm, laryngoedema, rash, pruritus, serum sickness, and anaphylaxis); Churg-Strauss syndrome (see notes above); thrombocytopenia, arthralgia, myalgia, and alopecia also reported.

### Dose
- By subcutaneous injection, **Adult** and **Child** over 6 years, according to immunoglobulin E concentration and body-weight, consult product literature.

### 3.4.3 Allergic emergencies

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow’s milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with *additives and excipients* in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergenic fats or oils.

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow’s milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with *additives and excipients* in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergenic fats or oils.

### Intramuscular adrenaline (epinephrine)

The *intramuscular route* is the *first choice route* for the administration of adrenaline (epinephrine) in the management of anaphylaxis. Adrenaline is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site (the intravenous route should be reserved for extreme emergency when there is doubt about the adequacy of the circulation, see Intravenous Adrenaline (Epinephrine), below).

Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injec-
**Respiratory system**

**3.4.3 Allergic emergencies**

Prompt injection of adrenaline is of paramount importance. The following adrenaline doses are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

<table>
<thead>
<tr>
<th>Dose of intramuscular injection of adrenaline (epinephrine) for anaphylaxis</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Age</strong></td>
</tr>
<tr>
<td>Child under 6 years</td>
</tr>
<tr>
<td>Child 6–12 years</td>
</tr>
<tr>
<td>Adult and child 12–18 years</td>
</tr>
</tbody>
</table>

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function.

### Intravenous adrenaline (epinephrine)

Intravenous adrenaline should be given only by those experienced in its use, in a setting where patients can be carefully monitored. When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline (epinephrine) can be given by slow intravenous injection in a dose of 50 micrograms (0.5 mL of the dilute 1 in 10 000 adrenaline injection) repeated according to response; if multiple doses are required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained. Children may respond as little as 1 microgram/kg (0.01 mL/kg) of the dilute 1 in 10 000 adrenaline injection by slow intravenous injection.

Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength. It is also important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

For reference to the use of the intravenous route for cardiac resuscitation, see section 2.7.3.

### Self-administration of adrenaline (epinephrine)

Individuals at considerable risk of anaphylaxis need to carry adrenaline (epinephrine) at all times and need to be instructed in advance when and how to inject it; injection technique is device specific. In addition, the packs need to be labelled so that in the case of rapid collapse someone else is able to administer the adrenaline. It is important to ensure that an adequate supply is provided to treat symptoms until medical assistance is available.

Adrenaline for administration by intramuscular injection is available in ‘auto-injectors’ (e.g. Anapen® and EpiPen®), pre-assembly syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available).

### Adrenaline/Epinephrine

**Indications** Emergency treatment of acute anaphylaxis; angioedema; cardiorespiratory resuscitation (section 2.7.3); priapism (unlicensed) (section 7.4.5)

**Cautions** For cautions in non-life-threatening situations, see section 2.7.3

**Interactions** Severe anaphylaxis in patients taking beta-blockers may not respond to adrenaline, calling for bronchodilator therapy; see intravenous salbutamol (p. 177); adrenaline can cause severe hypertension and bradycardia in those taking non-cardioselective beta-blockers. Other interactions, see Appendix 1 (sympathomimetics).

**Renal impairment** section 2.7.3

**Pregnancy** section 2.7.3

**Breast-feeding** section 2.7.3

**Side-effects** section 2.7.3

**Dose**

- Acute anaphylaxis, by intramuscular injection (preferably midpoint in anterolateral thigh) of 1 in 1000 (1 mg/mL) solution, see notes and table above
- Acute anaphylaxis when there is doubt as to the adequacy of the circulation, by slow intravenous injection of 1 in 10 000 (100 micrograms/mL) solution (extreme caution—specialist use only), see notes above

**Important** Intravenous route should be used with extreme care by specialists only, see notes above

#### Intramuscular or subcutaneous

1. Adrenaline/Epinephrine 1 in 10 000 (Non-proprietary)

   **Injection**, adrenaline (as acid tartrate) 1 mg/mL, net price 0.5-mL amp = 52p; 1-mL amp = 57p

2. Minijet® Adrenaline 1 in 10 000 (UCB Pharma)

   **Injection**, adrenaline (as hydrochloride) 1 in 1000 (1 mg/mL), net price 1 mL (with 25 gauge × 0.25 inch needle for subcutaneous injection) = £10.79, 1 mL (with 21 gauge × 1.5 inch needle for intramuscular injection) = £6.36 (both disposable syringes)

   **Excipients** include sodium chloride

#### Intravenous

- Extreme caution, see notes above

Adrenaline/Epinephrine 1 in 10 000, Dilute (Non-proprietary)

**Injection**, adrenaline (as acid tartrate) 100 micrograms/mL, 10-mL amp, 1-mL and 10-mL prefilled syringe

Minijet® Adrenaline 1 in 10 000 (UCB Pharma)

**Injection**, adrenaline (as hydrochloride) 1 in 10 000 (100 micrograms/mL), net price 3-mL prefilled syringe = £6.27; 10-mL prefilled syringe = £6.15

**Excipients** include sodium chloride

#### Intramuscular injection for self-administration

Anapen® (Lincoln Medical)

- **Anapen® 500** (delivering a single dose of adrenaline 500 micrograms), adrenaline 1.7 mg/mL, net price 1.05-mL auto-injector device = £30.67

**Excipients** include sulfites

**Note** 0.75 mL of the solution remains in the auto-injector device after use

**Dose** by intramuscular injection, ADULT and CHILD body-weight over 60 kg or those at risk of severe anaphylaxis, 500 micrograms repeated after 10–15 minutes as necessary

---

¹ For reference to the use of the intravenous route for anaphylaxis

² Note: 0.75 mL of the solution remains in the auto-injector device after use

---

1. Non-proprietary restriction does not apply to adrenaline injection 1 mg/mL where administration is for saving life in emergency
Angioedema

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline (epinephrine) injection and oxygen should be given as described under Anaphylaxis (see p. 197); antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.

Hereditary angioedema  The administration of C1-esterase inhibitor, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema, but is not practical for long-term prophylaxis; it can also be used for short-term prophylaxis before surgery or dental procedures [unlicensed indication]. Icatibant is licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid (section 2.11) and danazol (section 6.7.2) [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

C1-ESTERASE INHIBITOR

Indications acute attacks of hereditary angioedema; prophylaxis prior to surgery or major dental procedures [unlicensed]

Cautions vaccination against hepatitis A, p. 754 and hepatitis B, p. 755 may be required

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—no information available

Side-effects rarely injection-site reactions, hypersensitivity reactions (including anaphylaxis)

Dose

- By slow intravenous injection or intravenous infusion, ADULT and CHILD 20 units/kg

Berinert® (CSL Behring) ▼

Injection, powder for reconstitution C1-esterase inhibitor, net price 500-unit vial = £550.00

Electrolytes Na⁺ 2.1 mmol/10mL vial

ICATIBANT

Indications acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency

Cautions ischaemic heart disease, stroke

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

Breast-feeding manufacturer advises avoid for 12 hours after administration

Side-effects dizziness, headache, injection-site reactions, rash, pruritus, erythema

Dose

- By subcutaneous injection, ADULT over 18 years, 30 mg as a single dose, repeated after 6 hours if necessary; a third dose may be given after a further 6 hours (max. 3 doses in 24 hours)

Firazyr® (Shire HGT) ▼

Injection, icatibant (as acetate) 10 mg/mL, net price 3-mL prefilled syringe = £1395.00

3.5 Respiratory stimulants and pulmonary surfactants

3.5.1 Respiratory stimulants

3.5.2 Pulmonary surfactants
Respiratory system

3.5.2 Pulmonary surfactants

Pulmonary surfactants are used in the management of respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. They may also be given prophylactically to those considered at risk of developing the syndrome.

Cautions Continuous monitoring is required to avoid hyperoxaemia caused by rapid improvement in arterial oxygen concentration.

Side-effects Pulmonary haemorrhage and bradycardia have been rarely associated with pulmonary surfactants; obstruction of the endotracheal tube by mucous secretions and intracranial haemorrhage have also been reported.

BERACTANT

Indications treatment of respiratory distress syndrome in preterm neonates over 700 g; prophylaxis of respiratory distress syndrome in preterm neonates less than 32 weeks post-menstrual age

Cautions see notes above and consult product literature

Side-effects see notes above

Dose

- By endotracheal tube, phospholipid 100 mg/kg, equivalent to a volume of 4 mL/kg, preferably within 8 hours of birth (preferably within 15 minutes of birth for prophylaxis); dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses

Survanta® (Abbott) Suspension, beractant (bovine lung extract) providing phospholipid 25 mg/mL, with lipids and proteins, net price 8-mL vial = £306.43

PORACTANT ALFA

Indications treatment of respiratory distress syndrome or hyaline membrane disease in neonates over 700 g; prophylaxis of respiratory distress syndrome in preterm neonates 24–32 weeks post-menstrual age

Cautions see notes above and consult product literature

Side-effects see notes above; also rarely hypotension

Dose

- By endotracheal tube, treatment, 100–200 mg/kg; further doses of 100 mg/kg may be repeated at intervals of 12 hours; max. total dose 300–400 mg/kg; prophylaxis, 100–200 mg/kg soon after birth (preferably within 15 minutes); further doses of 100 mg/kg may be repeated 6–12 hours later and after a further 12 hours if still intubated; max. total dose 300–400 mg/kg

Curosurf® (Chiesi) Suspension, poractant alfa (porcine lung phospholipid fraction) 80 mg/mL, net price 1.5-mL vial = £281.64; 3-mL vial = £547.40

DOXAPRAM HYDROCHLORIDE

Indications see under Dose

Cautions give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing); give with beta, agonist in bronchoconstriction; hypertension (avoid if severe), impaired cardiac reserve; phaeochromocytoma; interactions: Appendix 1 (doxapram)

Contra-indications severe hypertension; status asthmaticus; coronary artery disease; hyperthyroidism; epilepsy and other convulsive disorders; physical obstruction of respiratory tract; cerebral oedema, cerebrovascular accident

Hepatic impairment use with caution

Pregnancy no evidence of harm, but manufacturer advises avoid unless benefit outweighs risk

Side-effects nausea, vomiting; hypertension, tachycardia, bradycardia, extrasystoles, arrhythmias, chest pain, flushing; dyspnoea, cough, bronchospasm, laryngospasm; pyrexia, headache, dizziness, hyperactivity, confusion, hallucination, convulsions; urinary retention, incontinence, perineal warmth; muscle spasms

Dose

- Postoperative respiratory depression, by intravenous injection over at least 30 seconds, 1–1.5 mg/kg repeated if necessary after intervals of 1 hour or alternatively by intravenous infusion, 2–3 mg/minute adjusted according to response; CHILD not recommended

- Acute respiratory failure, by intravenous infusion, 1.5–4 mg/minute adjusted according to response (given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions); CHILD not recommended

- Neonatal apnoea, see BNF for Children

Dopram® (Goldshield) Injection, doxapram hydrochloride 20 mg/mL. Net price 5-mL amp = £3.00

Intravenous infusion, doxapram hydrochloride 2 mg/mL in glucose 5%. Net price 500-mL bottle = £21.33

BNF 61

A reproducibility
Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide ($P_{CO2}$), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning (see also Emergency Treatment of Poisoning, p. 40) it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure, see below.

**High concentration oxygen therapy** is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen ($P_{O2}$) is usually associated with low or normal arterial carbon dioxide ($P_{CO2}$), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide ($P_{CO2}$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_{CO2}$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

**Low concentration oxygen therapy** (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:

- chronic obstructive pulmonary disease;
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an oxygen alert card, see section 3.1.

### Domiciliary oxygen

Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts. Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy (section 4.10.2) should be tried before home oxygen prescription.

**Air travel** Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient’s requirement should be discussed with the airline before travel.

### Long-term oxygen therapy

**Long-term** administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease.

Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease.

Long-term oxygen therapy should be considered for patients with:

- chronic obstructive pulmonary disease with $P_{O2} < 7.3$ kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with $P_{O2} 7.3–8$ kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with $P_{O2} < 7.3$ kPa or persistent disabling breathlessness;
- interstitial lung disease with $P_{O2} < 8$ kPa and in patients with $P_{O2} > 8$ kPa with disabling dyspnoea;
- cystic fibrosis when $P_{O2} < 7.3$ kPa or if $P_{O2} 7.3–8$ kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when $P_{O2} < 8$ kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime $P_{O2} < 7.3$ kPa when breathing air or with nocturnal hypoxaemia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

### Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used...
to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

Ambulatory oxygen therapy
Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

Oxygen therapy equipment
Under the NHS oxygen may be supplied as oxygen cylinders. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with ‘medium’ (2 litres/minute) and ‘high’ (4 litres/minute) settings.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis (see below). A concentrator is recommended for a patient who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a ‘Y’ connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is under-ventilating.

Arrangements for supplying oxygen
The following oxygen services may be ordered in England and Wales:
- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The supplier will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient’s consent to pass on the patient’s details to the supplier and the fire brigade. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient to use the equipment.

The clinician should send order forms to the supplier by facsimile (see below); a copy of the HOOF should be sent to the Primary Care Trust or Local Health Board. The supplier will continue to provide the service until a revised order is received, or until notified that the patient no longer requires the home oxygen service.

In Scotland refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. In Northern Ireland oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. In Scotland and Northern Ireland prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

3.7 Mucolytics
Mucolytics are prescribed to facilitate expectoration by reducing sputum viscosity. In some patients with chronic obstructive pulmonary disease and a chronic productive cough, mucolytics can reduce exacerbations; mucolytic therapy should be stopped if there is no benefit after a 4-week trial. Steam inhalation with postural drainage is effective in bronchiectasis and in some cases of chronic bronchitis.

Mucolytics should be used with caution in those with a history of peptic ulceration because they may disrupt the gastric mucosal barrier.

For reference to dornase alfa and hypertonic saline, see below.

CARBOCISTEINE

Indications reduction of sputum viscosity, see notes above
Cautions see notes above
Contra-indications active peptic ulceration
Pregnancy manufacturer advises avoid in first trimester
Breast-feeding no information available
### Side-effects
Rarely gastro-intestinal bleeding; hypersensitivity reactions (including rash and anaphylaxis) also reported.

**Dose**
- Initially 2.25 g daily in divided doses, then 1.5 g daily in divided doses as condition improves; **CHILD** 2–5 years 62.5–125 mg 4 times daily, 5–12 years 250 mg 3 times daily.

### Carbocisteine (Sanofi-Aventis)
**Capsules** carbocisteine 375 mg, net price 120-cap pack = £16.03. **Brands include** Mucodyne®.

**Oral liquid** carbocisteine 125 mg/5 mL, net price 300 mL = £4.39; 250 mg/5 mL, 300 mL = £5.61. **Brands include** Mucodyne® Poedathe 125 mg/5 mL (cherry- and raspberry-flavoured) and Mucodyne® 250 mg/5 mL (cinnamon- and rum-flavoured).

### ERDOSTEINE
**Indications** Symptomatic treatment of acute exacerbations of chronic bronchitis.

**Cautions** See notes above.

**Hepatic impairment** Manufacturer advises max. 300 mg daily in mild to moderate impairment; avoid in severe impairment.

**Renal impairment** Avoid if eGFR less than 25 mL/minute/1.73 m²—no information available.

**Pregnancy** Manufacturer advises avoid—no information available.

**Breast-feeding** Manufacturer advises avoid—no information available.

**Side-effects** Rarely nausea, vomiting, diarrhoea, abdominal pain, taste disturbance, headache, rash, and urticaria.

**Dose**
- **ADULT** over 18 years, 300 mg twice daily for up to 10 days.
- **Erdotin** (Galen) ▼ [Tel]
**Capsules** yellow/green, erdosteine 300 mg, net price 20-cap pack = £5.75.

**Note** The Scottish Medicines Consortium (October 2007) has advised that erdosteine (Erdotin®) is not recommended for the symptomatic treatment of acute exacerbations of chronic bronchitis.

### MECYSTEINE HYDROCHLORIDE
(Methyl Cysteine Hydrochloride)

**Indications** Reduction of sputum viscosity.

**Cautions** See notes above.

**Pregnancy** Manufacturer advises avoid.

**Breast-feeding** Manufacturer advises avoid.

**Dose**
- 200 mg 4 times daily for 2 days, then 200 mg 3 times daily for 6 weeks, then 200 mg twice daily; **CHILD** 5–12 years 100 mg 3 times daily.

**Viscain®** (Ranbaxy)
**Tablets** yellow, s/c, e/c, mecysteine hydrochloride 100 mg, net price 100 = £17.65. Label: 5, 22, 25.

### 3.8 Aromatic inhalations

**Dornase alfa**
Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA). It is used in cystic fibrosis and is administered by inhalation using a jet nebuliser (section 3.1.5).

**DORNASE ALFA**
Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase)

**Indications** Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function.

**Pregnancy** No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.

**Breast-feeding** Amount probably too small to be harmful—manufacturer advises caution.

**Side-effects** Rarely dyspepsia, chest pain, dysphonia, dyspnoea, pharyngitis, laryngitis, pyrexia, conjunctivitis, rhinitis, rash, urticaria.

**Dose**
- **ADULT and CHILD** over 5 years, by inhalation of nebulised solution (by jet nebuliser), 2500 units (2.5 mg) once daily (patients over 21 years may benefit from twice daily dosage).

** Pulmozyme® (Roche)** ▼ [Tel]
**Nebuliser solution** dornase alfa 1000 units (1 mg)/mL. Net price 2.5-mL (2500 units) vial = £16.55.

**Note** For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable.

### Hypertonic sodium chloride

Nebulised hypertonic sodium chloride solution (3–7%) is used to mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis). Temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects.

**MucoClear®** 6% (Pari)
**Nebuliser solution** sodium chloride 6%, net price 20 × 4 mL = £12.98, 60 × 4 mL = £27.00.

**Dose** By inhalation of nebulised solution, 4 mL twice daily.

**Nebusal®** 7% (Forest)
**Nebuliser solution** sodium chloride 7%, net price 60 × 4 mL = £27.00.

**Dose** By inhalation of nebulised solution, 4 mL up to twice daily.

### 3.8 Aromatic inhalations

Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be
used owing to the risk of scalding. Inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis. Menthol and eucalyptus inhalation is used to relieve sinusitis affecting the maxillary antrum (section 12.2.2).

**Children** The use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. Carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% given as nasal drops is preferred.

Benzoin Tincture, Compound, BP
(Friars’ Balsam)
Tincture, balsamic acids approx. 4.5%. Label: 15
Dose add one teaspoonful to a pint of hot, not boiling, water and inhale the vapour.

**Menthol and Eucalyptus Inhalation, BP 1980**
inhalation, racemethanol or levomethanol 2 g, eucalyptus oil 10 mL, light magnesium carbonate 7 g, water to 100 mL
Dose add one teaspoonful to a pint of hot, not boiling, water and inhale the vapour.

Dental prescribing on the NHS Menthol and Eucalyptus Inhalation BP, 1980 may be prescribed

MHRA/CHM advice (March 2008 and February 2009) Over-the-counter cough and cold medicines for children
Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:
- brompheniramine, chlorphenamine, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuana (expectorants);
- phenylephrine, pseudoephedrine, ephedrine, oxymetazoline, or xylometazoline (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

MHRA/CHM advice (October 2010) Over-the-counter codeine-containing liquid medicines for children
Children under 18 years should not use codeine-containing over-the-counter liquid medicines for cough suppression

**3.9 Cough preparations**

**3.9.1 Cough suppressants**

Cough may be a symptom of an underlying disorder, such as asthma (section 3.1.1), gastro-oesophageal reflux disease (section 1.1), or rhinitis (section 12.2.1), which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor (section 2.5.5.1), or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

**Codeine** may be effective but it is constipating and can cause dependence; **dextromethorphan** and **pholcodine** have fewer side-effects.

**Sedating antihistamines** are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

**Children** The use of over-the-counter cough suppressants containing codeine should be avoided in children under 18 years. Cough suppressants containing similar opioid analgesics such as dextromethorphan and pholcodine are not generally recommended in children and should be avoided in children under 6 years.

**CODEINE PHOSPHATE**

**Indications** dry or painful cough; diarrhoea (section 1.4.2); pain (section 4.7.2)

**Cautions** see notes above and section 4.7.2

**Contra-indications** section 4.7.2

**Hepatic impairment** section 4.7.2

**Renal impairment** section 4.7.2

**Pregnancy** section 4.7.2

**Breast-feeding** section 4.7.2

**Side-effects** section 4.7.2

**Dose**
- See under preparations below

**Codeine Linctus, BP**

**Linctus** (= oral solution), codeine phosphate 15 mg/5 mL. Net price 100 mL = 35p (diabetic, 39p)

Brands include Galcodine®

Dose 5–10 mL 3–4 times daily. **CHILD** (but not generally recommended, see MHRA advice above) 5–12 years, 2.5–5 mL.

**Note** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled ‘Diabetic Codeine Linctus’, shall be dispensed or supplied.

**Codeine Linctus, Paediatric, BP**

**Linctus** (= oral solution), codeine phosphate 3 mg/5 mL. Net price 100 mL = 18p

Brands include Galcodine® Paediatric (sugar-free)

Dose **CHILD** (but not generally recommended, see MHRA advice above) 2–5 years 5 mL, 3–4 times daily;

**Note** BP directs that Paediatric Codeine Linctus may be prepared extemporaneously by diluting Codeine Linctus with a suitable vehicle in accordance with the manufacturer’s instructions.

**Other preparations**

Tablets, syrup, and injection section 4.7.2
PHOLCODINE

Indications dry cough
Cautions asthma; chronic, persistent, or productive cough; interactions: Appendix 1 (pholcodine)
Contra-indications chronic bronchitis, chronic obstructive pulmonary disease, bronchiectasis, patients at risk of respiratory failure

Hepatic impairment avoid
Renal impairment use with caution; avoid in severe impairment
Pregnancy manufacturer advises avoid unless potential benefit outweighs risk
Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk—no information available

Side-effects nausea, vomiting, constipation, sputum retention, drowsiness, dizziness, excitation, confusion, rash

Dose
- See under preparations below

Pholcodine Linctus, BP
Linctus (= oral solution), pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1%. Net price 100 mL = 31p
Brands include Favocon-D® (sugar-free), Galenphol® (sugar-free)
Dose 5–10 mL 3–4 times daily. CHILD (but not generally recommended; see notes above) 6–12 years 2.5–5 mL

Pholcodine Linctus, Strong, BP
Linctus (= oral solution), pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%. Net price 100 mL = 44p
Dose ADULT and CHILD over 12 years, 5 mL 3–4 times daily
Brands include Galenphol®

Galenphol® (Thornton & Ross)
Paediatric linctus (= oral solution), orange, sugar-free, pholcodine 2 mg/5 mL. Net price 90-mL pack = £1.20
Dose CHILD (but not generally recommended, see notes above) 6–12 years 10 mL 3 times daily

Palliative care
Diamorphine and methadone have been used to control distressing cough in terminal lung cancer although morphine is now preferred (see p. 22). In other circumstances they are contra-indicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. Methadone linctus should be avoided because it has a long duration of action and tends to accumulate.

METHADONE HYDROCHLORIDE

Indications cough in terminal disease
Cautions section 4.7.2
Contra-indications section 4.7.2
Hepatic impairment section 4.7.2
Renal impairment section 4.7.2
Pregnancy section 4.7.2
Breast-feeding section 4.7.2
Side-effects section 4.7.2; longer-acting than morphine therefore effects may be cumulative

Dose
- See below

Methadone Linctus
Linctus (= oral solution), methadone hydrochloride 2 mg/5 mL in a suitable vehicle with a tolu flavour.
Label: 2
Dose 2.5–5 mL every 4–6 hours, reduced to twice daily on prolonged use

MORPHINE HYDROCHLORIDE

Indications cough in terminal disease (see also Prescribing in Palliative Care p. 22)
Cautions section 4.7.2
Contra-indications section 4.7.2
Hepatic impairment section 4.7.2
Renal impairment section 4.7.2
Pregnancy section 4.7.2
Breast-feeding section 4.7.2
Side-effects section 4.7.2

Dose
- Initially 5 mg every 4 hours

Preparations
Section 4.7.2

3.9.2 Demulcent and expectorant cough preparations

Demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as simple linctus have the advantage of being harmless and inexpensive; paediatric simple linctus is particularly useful in children. Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and not use more than one preparation at a time, see MHRA/CHM advice, p. 204.

Simple Linctus, BP
Linctus (= oral solution), citric acid monohydrate 2.5% in a suitable vehicle with an anise flavour. Net price 200 mL = 55p
Dose ADULT and CHILD over 12 years 5 mL 3–4 times daily
A sugar-free version is also available

Simple Linctus, Paediatric, BP
Linctus (= oral solution), citric acid monohydrate 0.625% in a suitable vehicle with an anise flavour. Net price 200 mL = 82p
Dose CHILD 1 month–12 years 5–10 mL 3–4 times daily
A sugar-free version is also available

3.10 Systemic nasal decongestants

Nasal decongestants for administration by mouth may not be as effective as preparations for local application (section 12.2.2) but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine is
available over the counter; it has few sympathomimetic effects.

Systemic decongestants should be used with caution in diabetes, hypertension, hyperthyroidism, susceptibility to angle-closure glaucoma, prostatic hypertrophy, ischaemic heart disease, and should be avoided in patients taking monoamine oxidase inhibitors; interactions: Appendix 1 (sympathomimetics).

**PSEUDOEPHEDRINE HYDROCHLORIDE**

**Indications** see notes above
**Cautions** see notes above
**Hepatic impairment** manufacturer advises caution in severe impairment
**Renal impairment** manufacturer advises caution in moderate to severe impairment
**Pregnancy** defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure
**Breast-feeding** amount too small to be harmful
**Side-effects** tachycardia, anxiety, restlessness, insomnia; rarely hallucinations, rash; very rarely angle-closure glaucoma; urinary retention also reported

**Dose**
- 60 mg 3–4 times daily; **CHILD** 6–12 years 30 mg 3–4 times daily

1. **Galpseud** (Thornton & Ross)
   - Tablets, pseudoephedrine hydrochloride 60 mg, net price 24-tab pack = £2.00
   - Linctus, orange, sugar-free, pseudoephedrine hydrochloride 30 mg/5 mL, net price 100 mL = 70p

2. **Sudafed** (McNeil)
   - Tablets, red, f/c, pseudoephedrine hydrochloride 60 mg, net price 24 = £2.12
   - Elixir, red, pseudoephedrine hydrochloride 30 mg/5 mL, net price 100 mL = £1.05

---

1. Can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see *Medicines, Ethics and Practice*, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available)
4.1 Hypnotics and anxiolytics

4.1.1 Hypnotics

Most anxiolytics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks (see Dependence and Withdrawal, below). Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate and barbiturates are not recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdosage.

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

Driving Hypnotics and anxiolytics may impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day. See also Drugs and Driving under General Guidance, p. 3.

Dependence and withdrawal Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens. Abrupt withdrawal of a barbiturate is even more likely to have serious effects.
The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

A benzodiazepine can be withdrawn in steps of about one-eighth (range one-tenth to one-quarter) of the daily dose every fortnight. A suggested withdrawal protocol for patients who have difficulty is as follows:

1. Transfer patient to equivalent daily dose of diazepam\(^1\) preferably taken at night
2. Reduce diazepam dose every 2–3 weeks in steps of 2 or 2.5 mg; if withdrawal symptoms occur, maintain this dose until symptoms improve
3. Reduce dose further, if necessary in smaller steps,\(^2\) it is better to reduce too slowly rather than too quickly
4. Stop completely; period needed for withdrawal can vary from about 4 weeks to a year or more

Counselling may help; beta-blockers should only be tried if other measures fail; antidepressants should be used only where depression or panic disorder co-exist or emerge; avoid antipsychotics (which may aggravate withdrawal symptoms).

Important: benzodiazepine indications

1. Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychiatric, organic, or psychotic illness.
2. The use of benzodiazepines to treat short-term ‘mild’ anxiety is inappropriate.
3. Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

**4.1.1 Hypnotics**

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others underestimate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.

**Chronic insomnia** is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine or mirtazapine prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should not be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome (section 4.1).

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

**Children** The prescribing of hypnotics to children, except for occasional use such as for night terrors and somnambulism (sleep-walking), is not justified.

**Elderly** Hypnotics should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

**Dental procedures** Some anxious patients may benefit from the use of a hypnotic the night before the dental appointment. Hypnotics do not relieve pain, and if pain interferes with sleep an appropriate analgesic should be given. Diazepam (section 4.1.2), nitrazepam or temazepam are used at night for dental patients. Temazepam is preferred when it is important to minimise any residual effect the following day. For information on anxiolytics for dental procedures, see section 15.1.4.1.

**Benzodiazepines**

Benzodiazepines used as hypnotics include nitrazepam and flurazepam which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative. Loprazolam, lormetazepam, and temazepam act for a shorter time and they have little or no hangover effect.
Withdrawal phenomena are more common with the short-acting benzodiazepines. If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam given as a single dose at night may effectively treat both symptoms.

For general guidelines on benzodiazepine prescribing see section 4.1.2 and for benzodiazepine withdrawal see section 4.1.

**Hepatic impairment** Benzodiazepines can precipitate coma if used in hepatic impairment. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Start with smaller initial doses or reduce dose; avoid in severe impairment.

**Renal impairment** Patients with renal impairment have increased cerebral sensitivity to benzodiazepines; start with small doses in severe impairment.

**Pregnancy** There is a risk of neonatal withdrawal symptoms when benzodiazepines are used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**Breast-feeding** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

### Nitrazepam

**Indications** insomnia (short-term use; see p. 208)

**Cautions** respiratory disease, muscle weakness and myasthenia gravis, history of drug or alcohol abuse, marked personality disorder; reduce dose in elderly and debilitated; avoid prolonged use (and abrupt withdrawal thereafter); acute porphyria (section 9.8.2); interactions: Appendix 1 (anxiolytics and hypnotics)

**Driving** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** respiratory depression; marked neuromuscular respiratory weakness including unstable myasthenia gravis; acute pulmonary insufficiency; sleep apnoea syndrome; not for use alone to treat depression (or anxiety associated with depression) or chronic psychosis.

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** drowsiness and lightheadedness the next day; confusion and ataxia (especially in the elderly); amnesia may occur; dependence; see also under Nitrazepam

**Overdosage:** see Emergency Treatment of Poisoning, p. 37

**Dose**

- 5–10 mg at bedtime; **ELDERLY** (or debilitated) 2.5–5 mg; **CHILD** not recommended

**Labels**

- Tablets, nitrazepam 5 mg, net price 28 = £0.98. Label: 19

**Brands include** Meda

Dental prescribing on NHS Nitrazepam Tablets may be prescribed

### Flurazepam

**Indications** insomnia (short-term use; see p. 208)

**Cautions** see under Nitrazepam

**Contra-indications** see under Nitrazepam

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Nitrazepam

**Dose**

- 15–30 mg at bedtime; **ELDERLY** (or debilitated) 15 mg; **CHILD** not recommended

**Labels**

- Tablets, flurazepam (as hydrochloride), 15 mg (grey/yellow), net price 30-cap pack = £6.73; 30 mg (black/grey), 30-cap pack = £8.63. Label: 19

### Loprazolam

**Indications** insomnia (short-term use; see p. 208)

**Cautions** see under Nitrazepam

**Contra-indications** see under Nitrazepam

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Nitrazepam; shorter acting

**Dose**

- 1 mg at bedtime, increased to 1.5 or 2 mg if required; **ELDERLY** (or debilitated) 0.5 or 1 mg; **CHILD** not recommended

**Labels**

- Tablets, loprazolam 1 mg (as mesilate). Net price 28-tab pack = £18.00. Label: 19

### Lormetazepam

**Indications** insomnia (short-term use; see p. 208)

**Cautions** see under Nitrazepam

**Contra-indications** see under Nitrazepam

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Nitrazepam

**Dose**

- 0.5–1.5 mg at bedtime; **ELDERLY** (or debilitated) 500 micrograms; **CHILD** not recommended

**Labels**

- Tablets, lormetazepam 500 micrograms, net price 30-tab pack = £56.25; 1 mg, 30-tab pack = £54.60. Label: 19

### Temezepam

**Indications** insomnia (short-term use; see p. 208); see also section 15.1.4.1 for peri-operative use

**Cautions** see under Nitrazepam

**Contra-indications** see under Nitrazepam

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

Oral suspension, nitrazepam 2.5 mg/5 mL. Net price 150 mL = £5.09. Label: 19

**Brands include** Somnite®

4 Central nervous system
Central nervous system

4

210 4.1.1 Hypnotics

ZOLEPID TARTRATE

Indications  insomnia (short-term use—up to 4 weeks)

Cautions  depression, muscle weakness and myasthenia gravis, history of drug or alcohol abuse; elderly; avoid prolonged use (and abrupt withdrawal thereafter); interactions: Appendix 1 (anxiolytics and hypnotics)

Driving  Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications  obstructive sleep apnoea, acute or severe respiratory depression, marked neuromuscular respiratory weakness including unstable myasthenia gravis, psychotic illness

Hepatic impairment  can precipitate coma; reduce dose to 5 mg (avoid if severe impairment)

Renal impairment  use with caution

Pregnancy  avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression

Breast-feeding  small amounts present in milk—avoid

Side-effects  diarrhoea, nausea, vomiting, dizziness, headache, drowsiness, hallucination, agitation, asthenia, amnesia; dependence, memory disturbances, nightmares, depression, confusion, perceptual disturbances or diplopia, tremor, ataxia, falls, skin reactions, changes in libido; paradoxical effects (see p. 207), muscular weakness, and sleep-walking also reported

Dose

• ADULT over 18 years, 10 mg at bedtime; ELDERLY (or debilitated) 5 mg

Zolpidem (Non-proprietary) (Sanofi-Aventis) Tablets, zolpidem tartrate 5 mg, net price 28-tab pack = £1.41; 10 mg, 28-tab pack = £1.46. Label: 19

Stilnoct® (Sanofi-Aventis) Tablets, both f/c, zolpidem tartrate 5 mg, net price 28-tab pack = £2.96; 10 mg, 28-tab pack = £4.31. Label: 19

ZOPICLONE

Indications  insomnia (short-term use—up to 4 weeks)

Cautions  elderly; muscle weakness and myasthenia gravis, history of drug or alcohol abuse, psychiatric illness; avoid prolonged use (risk of tolerance and withdrawal symptoms); interactions: Appendix 1 (anxiolytics and hypnotics)

Driving  Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications  marked neuromuscular respiratory weakness including unstable myasthenia gravis, respiratory failure, severe sleep apnoea syndrome

Hepatic impairment  can precipitate coma; reduce dose (avoid if severe impairment)

Renal impairment  start with small doses in severe impairment; increased cerebral sensitivity

Pregnancy  avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression

Breast-feeding  present in milk—avoid

Side-effects  taste disturbance; less commonly nausea, vomiting, dizziness, drowsiness, dry mouth, headache;

ZALEPLON

Indications  insomnia (short-term use—up to 2 weeks)

Cautions  respiratory insufficiency (avoid if severe); muscle weakness and myasthenia gravis, history of drug or alcohol abuse; depression (risk of suicidal ideation); avoid prolonged use (risk of tolerance and withdrawal symptoms); interactions: Appendix 1 (anxiolytics and hypnotics)

Contra-indications  sleep apnoea syndrome, marked neuromuscular respiratory weakness including unstable myasthenia gravis

Hepatic impairment  can precipitate coma; reduce dose to 5 mg (avoid if severe impairment)

Pregnancy  use only if necessary and restrict to occasional short-term use; risk of withdrawal symptoms in neonate if used in late pregnancy

Breast-feeding  present in milk but amount probably too small to be harmful

Side-effects  amnesia, paraesthesia, drowsiness; dysmenorrhea; less commonly nausea, anorexia, asthenia, incoordination, confusion, impaired concentration, depression, depersonalisation, dizziness, hallucinations, disturbances of smell, hearing, speech, and vision; photosensitivity; paradoxical effects (see p. 207) and sleep-walking also reported

Dose

• ADULT over 18 years, 10 mg at bedtime; ELDERLY (or debilitated) 5 mg

Sonata® (Meda) Capsules, zaleplon 5 mg (white/light brown), net price 14-cap pack = £3.12; 10 mg (white), 14-cap pack = £3.76. Label: 2

Zaleplon, zolpidem, and zopiclone

Zaleplon, zolpidem, and zopiclone are non-benzodiazepine hypnotics, but they act at the benzodiazepine receptor. They are not licensed for long-term use; dep-
rarely amnesia, confusion, depression, hallucinations, nightmares; very rarely light headiness, incoordination; paradoxical effects (see p. 207) and sleep-walking also reported

**Dose**
- **ADULT** over 18 years, 7.5 mg at bedtime; **ELDERLY** initially 3.75 mg at bedtime increased if necessary

**Zopiclone (Non-proprietary)**

**Tablets**, zopiclone 3.75 mg, net price 28-tab pack = £1.34; 7.5 mg, 28-tab pack = £1.35. Label: 19

**Zimovane® (Sanofi-Aventis)**

**Tablets**, f/c, zopiclone 3.75 mg (Zimovane® LS), net price 28-tab pack = £2.24; 7.5 mg (scored), 28-tab pack = £3.26. Label: 19

### Chloral and derivatives

Chloral hydrate and derivatives were formerly popular hypnotics for children (but the use of hypnotics in children is not usually justified). There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

#### CHLORAL HYDRATE

**Indications** insomnia (short-term use)

**Cautions** reduce dose in elderly and debilitated; avoid prolonged use (and abrupt withdrawal thereafter); avoid contact with skin and mucous membranes; interactions: Appendix 1 (anxiolytics and hypnotics)

**Driving** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** severe cardiac disease; gastritis; acute porphyria (section 9.8.2)

**Hepatic impairment** can precipitate coma; reduce dose in mild to moderate impairment; avoid in severe impairment

**Renal impairment** avoid in severe impairment

**Pregnancy** avoid

**Breast-feeding** risk of sedation in infant—avoid

**Side-effects** gastric irritation (nausea and vomiting reported), abdominal distention, flatulence, headache, tolerance, dependence, excitement, delirium (especially on abrupt withdrawal), ketonuria, and rash

**Dose**
- See under preparations below

#### Chloral Mixture, BP 2000

(Chloral Oral Solution)

**Mixture**, chloral hydrate 500 mg/5 mL in a suitable vehicle. Label: 19, 27

**Dose** 5–20 mL; **CHILD** 1–12 years 30–50 mg/kg (max. 1 g), taken well diluted with water at bedtime

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

#### Chloral Elixir, Paediatric, BP 2000

(Chloral Oral Solution, Paediatric)

**Elixir**, chloral hydrate 200 mg/5 mL (4%) in a suitable vehicle with a black currant flavour. Label: 1, 27

**Dose** **CHILD** 1 month–1 year 30–50 mg/kg, taken well diluted with water at bedtime

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

---

**Cloral betaine**

**Welldorm® (Alphashow)**

**Tablets**, blue-purple, f/c, cloral betaine 707 mg (≡ chloral hydrate 414 mg), net price 30-tab pack = £12.10. Label: 19, 27

**Dose** **ADULT** and **CHILD** over 12 years, 1–2 tablets with water or milk at bedtime, max. 9 tablets (chloral hydrate 2 g) daily

**Elixir**, red, chloral hydrate 143.3 mg/5 mL, net price 150-mL pack = £8.70. Label: 19, 27

**Dose** 15–45 mL (chloral hydrate 0.4–1.3 g) with water or milk, at bedtime, max. 70 mL (chloral hydrate 2 g) daily; **CHILD** 2–12 years, 1–1.75 mL/kg (chloral hydrate 30–50 mg/kg), max. 35 mL (chloral hydrate 1 g) daily

---

**Clomethiazole**

Clomethiazole may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs. It is also licensed for use in acute alcohol withdrawal, but see section 4.10.1.

**CLOMETHIAZOLE**

(Chlormethiazole)

**Indications** see under Dose; alcohol withdrawal (section 4.10.1)

**Cautions** cardiac and respiratory disease (confusional state may indicate hypoxia), chronic pulmonary insufficiency, sleep apnoea syndrome; history of drug abuse; avoid prolonged use (and abrupt withdrawal thereafter); marked personality disorder; elderly; excessive sedation may occur (particularly with higher doses); interactions: Appendix 1 (anxiolytics and hypnotics)

**Driving** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** acute pulmonary insufficiency; alcohol-dependent patients who continue to drink

**Hepatic impairment** can precipitate coma; reduce dose

**Renal impairment** start with small doses in severe impairment; increased cerebral sensitivity

**Pregnancy** avoid if possible—especially during first and third trimesters

**Breast-feeding** amount too small to be harmful

**Side-effects** nasal congestion and irritation (increased nasopharyngeal and bronchial secretions), conjunctival irritation, headache; rarely gastro-intestinal disturbances, paradoxical excitement, confusion, dependence, rash, urticaria, bulous eruption, anaphylaxis, alterations in liver enzymes

**Dose**
- Severe insomnia in the elderly (short-term use), 1–2 capsules at bedtime; **CHILD** not recommended
- Restlessness and agitation in the elderly, 1 capsule 3 times daily
- Alcohol withdrawal (but see section 4.10.1), initially 2–4 capsules, if necessary repeated after some hours; day 1 (first 24 hours), 9–12 capsules in 3–4 divided doses; day 2, 6–8 capsules in 3–4 divided doses; day 3, 4–6 capsules in 3–4 divided doses; then gradually reduced over days 4–6; total treatment for not more than 9 days

**Heminevrin® (AstraZeneca)**

**Capsules**, grey-brown, clomethiazole base 192 mg in an oily basis. Net price 60-cap pack = £4.78. Label: 19
Central nervous system

4.1.1 Hypnotics

Antihistamines

Some antihistamines (section 3.4.1) such as promethazine are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

Promethazine is also popular for use in children, but the use of hypnotics in children is not usually justified.

PROMETHAZINE HYDROCHLORIDE

Indications sedation (short-term use); allergy and urticaria (section 3.4.1); nausea and vomiting (section 4.6)

Cautions see Promethazine Hydrochloride, section 3.4.1

Contra-indications see notes in section 3.4.1

Renal impairment see Promethazine Hydrochloride, section 3.4.1

Pregnancy see notes in section 3.4.1

Breast-feeding see notes in section 3.4.1

Side-effects see Promethazine Hydrochloride, section 3.4.1

Dose

- By mouth, 25–50 mg; CHILD 2–5 years 15–20 mg, 5–10 years 20–25 mg
- By deep intramuscular injection, 25–50 mg; CHILD 5–10 years 6.25–12.5 mg

Preparations

Section 3.4.1

Alcohol

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders; interactions: Appendix 1 (alcohol).

Sodium oxybate

Sodium oxybate is a central nervous system depressant that is licensed for the treatment of narcolepsy with cataplexy.

SODIUM OXYBATE

Indications narcolepsy with cataplexy (under specialist supervision)

Cautions history of drug abuse or depression; epilepsy; elderly; respiratory disorders; heart failure and hypertension (high sodium content); risk of discontinuation effects including rebound cataplexy and withdrawal symptoms; acute porphyria (section 9.8.2); interactions: Appendix 1 (sodium oxybate)

Hepatic impairment halve initial dose

Renal impairment caution—contains 3.96 mmol Na+ /mL

Pregnancy avoid

Breast-feeding no information available

Side-effects nausea, vomiting, diarrhoea, abdominal pain, anorexia; hypertension, peripheral oedema; dyspnoea; sleep disorders, confusion, disorientation, paraesthesia, hypoaesthesia, impaired attention, depression, drowsiness, anxiety, dizziness, headache, tremor, asthma, fatigue; urinary incontinence, nocturnal enuresis; arthralgia, muscle cramps; blurred vision; sweating; less commonly faecal incontinence, myoclonus, psychosis, paranoia, hallucination, agitation, amnesia, and rash; respiratory depression, dependence, seizures, suicidal ideation, and urticaria also reported

Dose

- ADULT over 18 years, initially 2.25 g on retiring and repeated 2.5–4 hours later, increased according to response in steps of 1.5 g daily in 2 divided doses at intervals of 1–2 weeks; max. 9 g daily in two divided doses

Note Dose titration should be repeated if restarting after interval of more than 14 days

Counselling Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose

Xyrem® (UCB Pharma) ▼ Pat

Oral solution, sugar-free, sodium oxybate 500 mg/mL, net price 180 mL (with graduated syringe) = £360.00. Label: 13, 19, counselling, administration

Electrolytes Na+ 3.96 mmol/mL

Melatonin

Melatonin is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years. For information on the use of melatonin in children and adolescents, see BNF for Children.

MELATONIN

Indications insomnia (short-term use)

Cautions autoimmune disease (manufacturer advises avoid—no information available); interactions: Appendix 1 (melatonin)

Hepatic impairment clearance reduced—avoid

Renal impairment no information available—use with caution

Pregnancy no information available—avoid

Breast-feeding present in milk—avoid

Side-effects less commonly abdominal pain, dyspepsia, dry mouth, mouth ulceration, weight gain, hypertension, chest pain, malaise, dizziness, restlessness, nervousness, irritability, anxiety, migraine, proteinuria, glycosuria, pruritus, rash, dry skin; rarely thirst, flatulence, hallucosis, salivation, vomiting, gastritis, hypertriglyceridaemia, angina, palpitation, syncope, hot flushes, aggression, impaired memory, restless legs syndrome, paraesthesia, mood changes, priapism, increased libido, prostatitis, polyuria, haematuria, leucopenia, thrombocytopenia, electrolyte disturbances, muscle spasm, arthritis, lacermination, visual disturbances, nail disorder

Dose

- ADULT over 55 years, 2 mg once daily 1–2 hours before bedtime for up to 13 weeks; CHILD 1 month–18 years see BNF for Children

Circadin® (Lundbeck) ▼ Pat

Tablets, m/r, melatonin 2 mg, net price 21-tab pack = £10.77. Label: 2, 21, 25
**4.1.2 Anxiolytics**

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines. In children, anxiolytic treatment should be used only to relieve acute anxiety (and related insomnia) caused by fear (e.g. before surgery).

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time (see p. 208). Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressants (section 4.3) are licensed for use in anxiety and related disorders; see section 4.3 for a comment on their role in chronic anxiety. Some antipsychotics, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects (section 4.2.1). The use of antihistamines (e.g. hydroxyzine) for their sedative effect in anxiety is not appropriate.

Beta-blockers (section 2.4) do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

### Benzodiazepines

Benzodiazepines are indicated for the short-term relief of severe anxiety; long-term use should be avoided (see p. 208). Diazepam, alprazolam, chlordiazepoxide, and clonazepam have a sustained action. Shorter-acting compounds such as lorazepam and oxazepam may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In panic disorders (with or without agoraphobia) resistant to antidepressant therapy (section 4.3), a benzodiazepine (lorazepam 3–5 mg daily or clonazepam 1–2 mg daily (section 4.8.1) [both unlicensed]) may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms. Diazepam or lorazepam are very occasionally administered intravenously for the control of panic attacks. This route is the most rapid but the procedure is not without risk (section 4.8.2) and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

For guidelines on benzodiazepine withdrawal, see p. 207.

### Hepatic impairment

Benzodiazepines can precipitate coma if used in hepatic impairment. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Start with smaller initial doses or reduce dose; avoid in severe impairment.

#### Renal impairment

Patients with renal impairment have increased cerebral sensitivity to benzodiazepines; start with small doses in severe impairment.

#### Pregnancy

There is a risk of neonatal withdrawal symptoms when benzodiazepines are used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**Breast-feeding** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
5 mg/minute), for severe acute anxiety, control of acute panic attacks, and acute alcohol withdrawal, 10 mg, repeated if necessary after not less than 4 hours.

**Note** Only use intramuscular route when oral and intravenous routes not possible; emulsion formulation preferred for intravenous injection. Special precautions for intravenous injection section 4.8.2.

- By rectum as rectal solution, acute anxiety and agitation, 500 micrograms/kg repeated after 12 hours as required; ELDERLY: 250 micrograms/kg. CHILD not recommended.

As suppositories, anxiety when oral route not appropriate, 10–30 mg (higher dose divided); dose form not appropriate for less than 10 mg.

**Diazepam (Non-proprietary)**

**Lorazepam (Non-proprietary)**

- Tablets, lorazepam 1 mg, net price 28-tab pack = £5.42; 2.5 mg, 28-tab pack = £7.11. Label: 2 or 19.

**Injection**, lorazepam 4 mg/mL, net price 1-mL amp = 35p.

- Excipients include benzyl alcohol, propylene glycol (see Excipients, p. 2).

- Brands include Ativan (®).

**Note** For intramuscular injection it should be diluted with an equal volume of water for injections or physiological saline (but only use when oral and intravenous routes not possible).
**Meprobamate**

*Indications* short-term use in anxiety, but see notes above

*Cautions* respiratory disease, muscle weakness, epilepsy (may induce seizures), history of drug or alcohol abuse, marked personality disorder; elderly and debilitated; avoid prolonged use, abrupt withdrawal (may precipitate convulsions); *interactions*: Appendix 1 (anxiolytics and hypnotics)

*Driving* Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

*Contra-indications* acute pulmonary insufficiency; respiratory depression; acute porphyria (section 9.8.2)

*Hepatic impairment* can precipitate coma

*Renal impairment* start with small doses in severe impairment; increased cerebral sensitivity

*Pregnancy* avoid if possible

*Breast-feeding* avoid; concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant

*Side-effects* see under Diazepam

*Dosage*
- 400 mg 3–4 times daily; **ELDERLY** half adult dose or less; **CHILD** not recommended
- **Note** Meprobamate treatment should not be initiated in new patients, see notes above

*Meprobamate (Non-proprietary)*

- **Tablets**, scored, meprobamate 400 mg, net price 84-tab pack = £19.95. Label: 2

---

**Central nervous system**

**4.1.3 Barbiturates**

**BNF 61**

**Oxazepam**

*Indications* anxiety (short-term use; see p. 208)

*Cautions* see under Diazepam; short acting

*Contra-indications* see under Diazepam

*Hepatic impairment* see notes above

*Renal impairment* see notes above

*Pregnancy* see notes above

*Breast-feeding* see notes above

*Side-effects* see under Diazepam

*Dosage*
- Anxiety, 15–30 mg (elderly or debilitated 10–20 mg) 3–4 times daily; **CHILD** not recommended
- Insomnia associated with anxiety, 15–25 mg (max. 50 mg) at bedtime; **CHILD** not recommended

*Oxazepam (Non-proprietary)*

- **Tablets**, oxazepam 10 mg, net price 28-tab pack = £4.85; 15 mg, 28-tab pack = £5.16. Label: 2

**Buspirone**

Buspirone is thought to act at specific serotonin (5HT1A) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone. The dependence and abuse potential of buspirone is low; it is, however, licensed for short-term use only (but specialists occasionally use it for several months).

**BUSPIRONE HYDROCHLORIDE**

*Indications* anxiety (short-term use)

*Cautions* does not alleviate benzodiazepine withdrawal (see notes above); *interactions*: Appendix 1 (anxiolytics and hypnotics)

*Driving* May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

*Contra-indications* epilepsy; acute porphyria (section 9.8.2)

*Hepatic impairment* reduce dose in mild to moderate disease; avoid in severe disease

*Renal impairment* reduce dose; avoid if eGFR less than 20 mL/minute/1.73 m²

*Pregnancy* avoid

*Breast-feeding* avoid

*Side-effects* nausea; dizziness, headache, nervousness; excitement; rarely dry mouth, tachycardia, palpitation, chest pain, drowsiness, confusion, seizures, fatigue, and sweating

*Dosage*
- **ADULT** over 18 years, 5 mg 2–3 times daily, increased as necessary every 2–3 days; usual range 15–30 mg daily in divided doses; max. 45 mg daily

*Buspirone Hydrochloride (Non-proprietary)*

- **Tablets**, buspirone hydrochloride 5 mg, net price 30-tab pack = £13.01; 10 mg, 30-tab pack = £15.34.

*Counselling, driving*

**Meprobamate**

Meprobamate is less effective than the benzodiazepines, more hazardous in overdosage, and can also induce dependence. It is not recommended.

**Important:** MHRA/CHM have advised that treatment with meprobamate should not be initiated.

---

**4.2 Drugs used in psychoses and related disorders**

**4.2.1 Antipsychotic drugs**

**4.2.2 Antipsychotic depot injections**

**4.2.3 Antimanic drugs**

Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit. Unless otherwise stated, doses in the BNF are licensed doses—
Antipsychotic drugs

Antipsychotic drugs are also known as ‘neuroleptics’ and (misleadingly) as ‘major tranquillisers’. Antipsychotic drugs generally tranquilise without impairing consciousness and without causing paradoxical excitement but they should not be regarded merely as tranquillisers. For conditions such as schizophrenia the tranquilising effect is of secondary importance.

In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia Antipsychotic drugs relieve psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse. Although they are usually less effective in apathetic withdrawn patients, they sometimes appear to have an activating influence. Patients with acute schizophrenia generally respond better than those with chronic symptoms. Patients should receive antipsychotic drugs for 4–6 weeks before the drug is deemed ineffective.

Long-term treatment of a patient with a definite diagnosis of schizophrenia may be necessary even after the first episode of illness in order to prevent the illness from becoming chronic. Withdrawal of drug treatment requires careful surveillance because the patient who appears well on medication may suffer a disastrous relapse if treatment is withdrawn inappropriately. In addition the need for continuation of treatment may not become immediately evident because relapse is often delayed for several weeks after cessation of treatment.

Antipsychotic drugs are considered to act by interfering with dopaminergic transmission in the brain by blocking dopamine D2 receptors, which may give rise to the extrapyramidal effects described below, and also to hyperprolactinaemia. Antipsychotic drugs may also affect cholinergic, alpha-adrenergic, histaminergic, and serotonergic receptors.

Caution Antipsychotic drugs should be used with caution in patients with cardiovascular disease; an ECG may be required (see individual drug monographs), particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient. Antipsychotic drugs should also be used with caution in Parkinson’s disease (may be exacerbated by antipsychotics), epilepsy (and conditions predisposing to epilepsy), depression, myasthenia gravis, prostatic hypertrophy, or a susceptibility to angle-closure glaucoma. Caution is also required in severe respiratory disease and in patients with a history of jaundice or who have blood dyscrasias (perform blood counts if unexplained infection or fever develops). As photosensitisation may occur with higher dosages, patients should avoid direct sunlight. Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year. Interaction: Appendix 1 (antipsychotics).

Contra-indications Antipsychotic drugs may be contra-indicated in comatose states, CNS depression, and phaeochromocytoma.

Prescribing for the elderly

The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack. Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather. It is recommended that:

- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient’s weight, co-morbidity, and concomitant medication.
- Treatment should be reviewed regularly.

Driving Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

Withdrawal There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.
Hepatic impairment All antipsychotics can precipitate coma if used in hepatic impairment; phenothiazines are hepatotoxic. The manufacturer of zuclopenthixol (Clopitol®) advises that the dose should be halved in hepatic impairment, and serum-level monitoring should be considered.

Renal impairment Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity. Pericyazine should be avoided in renal impairment. The dose of zuclopenthixol should be halved in patients with renal failure.

Pregnancy Extrapyramidal effects have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy.

Breast-feeding There is limited information available on the short- and long-term effects of antipsychotics on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotics whilst breast-feeding should be avoided unless absolutely necessary.

Side-effects Extrapyramidal symptoms are the most troublesome. They occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility. Extrapyramidal symptoms consist of:

- **parkinsonian symptoms** (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- **dystonia** (abnormal face and body movements) and **dyskinesia**, which occur more commonly in children or young adults and appear after only a few doses;
- **akathisia** (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated; and
- **tardive dyskinesia** (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

**Parkinsonian symptoms** remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs (section 4.9.2). However, routine administration of such drugs is not justified because not all patients are affected and because they may unmask or worsen tardive dyskinesia.

**Tardive dyskinesia** is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

**Hypotension and interference with temperature regulation** are dose-related side-effects and are liable to cause dangerous falls and hypoactivity or hyperthermia in the elderly.

**Neuroleptic malignant syndrome** (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of some drugs. Discontinuation of the antipsychotic is essential because there is no proven effective treatment, but cooling, bromocriptine, and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

**Other side-effects** include: drowsiness; apathy; agitation, excitement and insomnia; convulsions; dizziness; headache; confusion; gastro-intestinal disturbances; nasal congestion; antimuscarinic symptoms (such as dry mouth, constipation, difficulty with micturition, and blurred vision; very rarely, precipitation of angle-closure glaucoma); cardiovascular symptoms (such as hypotension, tachycardia, and arrhythmias); ECG changes (cases of sudden death have occurred); venous thromboembolism; endocrine effects such as menstrual disturbances, galactorrhoea, gynaecomastia, impotence, and weight gain; blood dyscrasias (such as agranulocytosis and leucopenia), photosensitisation, contact sensitisation and rashes, and jaundice (including cholestatic); corneal and lens opacities, and purplish pigmentation of the skin, cornea, conjunctiva, and retina.

**Overdose** for poisoning with phenothiazines and related compounds, see Emergency Treatment of Poisoning, p. 38.

**Classification of antipsychotics** The phenothiazine derivatives can be divided into 3 main groups.

- **Group 1**: chlorpromazine, levoamphetamine, and promazine, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2**: pericyazine and pipotiazine, generally characterised by moderate sedative effects, marked antimuscarinic effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3**: fluphenazine, perphenazine, prochlorperazine, and trifluoperazine, generally characterised by fewer sedative effects, fewer antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Drugs of other chemical groups resemble the phenothiazines of group 3 in their clinical properties. They include the **butyrophenones** (benperidol and haloperidol), **diphenylbutylipeperidines** (pimozide); **thioxanthenes** (flupentixol and zuclopenthixol); and the **substituted benzamides** (sulpiride).

For details of the newer antipsychotic drugs amisulpride, aripiprazole, clozapine, olanzapine, paliperidone, quetiapine, and risperidone see under Atypical Antipsychotic Drugs, p. 222.

**Choice** As indicated above, the various drugs differ somewhat in predominant actions and side-effects. Selection is influenced by the degree of sedation required and the patient’s susceptibility to extrapyramidal side-effects. However, the differences between antipsychotic drugs are less important than the great variability in patient response; moreover, tolerance to secondary effects such as sedation usually develops. The atypical antipsychotics may be appropriate if extrapyramidal side-effects are a particular concern (see
under Atypical Antipsychotic Drugs, below). Clozapine is used for schizophrenia when other antipsychotics are ineffective or not tolerated.

Prescribing of more than one antipsychotic drug at the same time is not recommended; it may constitute a hazard and there is no significant evidence that side-effects are minimised.

Chlorpromazine is still widely used despite the wide range of adverse effects associated with it. It has a marked sedating effect and is useful for treating violent patients without causing stupor. Agitated states in the elderly can be controlled without confusion, a dose of 10 to 25 mg once or twice daily usually being adequate.

Flupentixol and pimozide (see ECG monitoring, p. 220) are less sedating than chlorpromazine.

Sulpiride in high doses controls florid positive symptoms, but in lower doses it can have an alerting effect on apathetic withdrawn schizophrenics. Fluphenazine, haloperidol, and trifluoperazine are also of value but their use is limited by the high incidence of extrapyramidal symptoms. Haloperidol may be preferred for the rapid control of hyperactive psychotic states; it causes less hypotension than chlorpromazine and is therefore also popular for agitation and restlessness in the elderly, despite the high incidence of extrapyramidal side-effects.

Promazine is not sufficiently active by mouth to be used as an antipsychotic drug; it has been used to treat psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly (see Other uses, below).

Other uses Nausea and vomiting (section 4.6), choreas, motor tics (section 4.9.3), and intractable hiccup (see under Chlorpromazine Hydrochloride and under Haloperidol). Benperidol is used in deviant antisocial sexual behaviour but its value is not established; see also section 6.4.2 for the role of cyproterone acetate.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly (but see p. 216).

**Equivalent doses of oral antipsychotics**

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

Important These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

### Dosage

**After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose.** For the advice of The Royal College of Psychiatrists on doses above the BNF upper limit, see p. 215.

### Benperidol

**Indications** control of deviant antisocial sexual behaviour (but see notes above)

**Cautions** see notes above; also manufacturer advises regular blood counts and liver function tests during long-term treatment; risk factors for stroke

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- 0.25–1.5 mg daily in divided doses, adjusted according to response; ELDERLY (or debilitated) initially half adult dose; CHILD not recommended

**Anquilt** (Archimedes) Tablets, scored, benperidol 250 micrograms, net price 112-tab pack = £97.76. Label: 2

**Note** The proprietary name Benquilt has been used for benperidol tablets

### Chlorpromazine Hydrochloride

**Warning** Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care

**Indications** see under Dose; antiemetic in palliative care (section 4.6)

**Cautions** see notes above; also diabetes; patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection; dose adjustment may be necessary if smoking started or stopped during treatment

**Contra-indications** see notes above; hypothyroidism

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also hyperglycaemia

**Dose**

- **By mouth**, schizophrenia and other psychoses, mania, short-term adjunctive management of severe anxiety, psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, initially 25 mg 3 times daily (or 75 mg at night), adjusted according to response, to usual maintenance dose of 75–300 mg daily (but up to 1 g daily may be required in psychoses); ELDERLY (or debilitated) third to half adult dose; CHILD (childhood schizophrenia and autism) 1–6 years 500 micrograms/kg every 4–6 hours (max. 40 mg daily); 6–12 years 10 mg 3 times daily (max. 75 mg daily)

Intractable hiccup, 25–50 mg 3–4 times daily

**Important** These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.
4.2.1 Antipsychotic drugs

- **Fluanxol**
- **Depixol**

**Indications**
- Schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity; depression (section 4.3.4)
- Cautions
  - see notes above
  - diabetes; avoid in acute porphyria (section 9.8.2)
- Contra-indications
  - see notes above
  - Pregnancy
  - see notes above
  - Breast-feeding
  - see notes above

- **Chlorpromazine**
  - (Non-proprietary)
  - Tablets, coated, chlorpromazine hydrochloride 25 mg, net price 28-tab pack = £1.77; net price 100 = £6.86. Label: 2, 11
  - Oral solution, chlorpromazine hydrochloride 25 mg/5 mL, net price 150 mL = £1.79, 100 mg/5 mL, 150 mL = £4.28. Label: 2, 11
  - Injection, chlorpromazine hydrochloride 25 mg/mL, net price 1-mL amp = 60p; 2-mL amp = 63p
  - Suppositories, chlorpromazine 25 mg and 100 mg.
  - Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988
  - **Largactil** (Sanofi-Aventis)
    - Injection, chlorpromazine hydrochloride 25 mg/mL, net price 2-mL amp = 60p

**FLUPENTIXOL** (Flupentixol)

- **Indications**
  - schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity; depression (section 4.3.4)
  - Cautions
  - see notes above
  - diabetes; avoid in acute porphyria (section 9.8.2)
- Contra-indications
  - see notes above
  - Renal impairment
  - see notes above
  - Pregnancy
  - see notes above
- Hepatic impairment
  - see notes above
  - Breast-feeding
  - see notes above
- Side-effects
  - see notes above; less sedating but with extrapyramidal symptoms frequent; hyperglycaemia

**Dose**
- Psychosis, initially 3–9 mg twice daily adjusted according to the response; max. 18 mg daily; ELDENRY (or debilitated) initially half adult dose
- CHILD, not recommended

**Depixol** (Lundbeck)

- Tablets, yellow, s/c, flupentixol 3 mg (as dihydrochloride), net price 100 = £6.23. Label: 2
- **Fluanxol** (Lundbeck)
  - Section 4.3.4 (depression)
  - Depot preparation
  - Section 4.2.2

**HALOPERIDOL**

- **Indications**
  - see under Dose; motor tics (section 4.9.3)
  - Cautions
  - see notes above; also subarachnoid haemorrhage; metabolic disturbances such as hypokalaemia, hypocalcaemia, or hypomagnesaemia; thyrotoxicosis; arteriosclerosis; dose adjustment may be necessary if smoking started or stopped during treatment
- **Contra-indications**
  - see notes above; QT-interval prolongation (avoid concomitant administration of drugs that prolong QT interval); bradycardia
- **Hepatic impairment**
  - see notes above
  - Pregnancy
  - see notes above
  - Renal impairment
  - see notes above
- **Breast-feeding**
  - see notes above
- **Side-effects**
  - see notes above, but less sedating and fewer antimuscarinic or hypotensive symptoms; pigmentation and photosensitivity reactions rare; depression; weight loss; less commonly dyspnoea, oedema; rarely bronchospasm, hypoglycaemia, and inappropriate antidiuretic hormone secretion; hypertension, sweating, Stevens-Johnson syndrome, and toxic epidermal necrolysis also reported

**Dose**
- Schizophrenia and other psychoses, mania, short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, ADULT and CHILD over 12 years, by mouth, initially 0.5–3 mg 2–3 times daily or 3–5 mg 2–3 times daily in severely affected or resistant patients; in resistant schizophrenia up to 30 mg daily may be needed; adjusted according to response to lowest effective maintenance dose (as low as 5–10 mg daily); ELDENRY (or debilitated) initially half adult dose
  - By intramuscular or by intravenous injection, ADULT over 18 years, initially 2–10 mg, then every 4–8 hours according to response to total max. 18 mg daily; severely disturbed patients may require initial dose of up to 18 mg; ELDENRY (or debilitated) initially half adult dose
- Agitation and restlessness in the elderly, by mouth, initially 0.5–1.5 mg once or twice daily
- Short-term adjunctive management of severe anxiety, by mouth, ADULT over 18 years, 500 micrograms twice daily
- Motor tics, adjunctive treatment in choreas and Tourette syndrome, by mouth, 0.5–1.5 mg 3 times daily adjusted according to response; 10 mg daily or more may occasionally be necessary in Tourette syndrome; CHILD 5–12 years, Tourette syndrome, 12.5–25 microgram/kg twice daily, adjusted according to response up to max. 10 mg daily
- Intractable hiccup, by mouth, ADULT over 18 years, 1.5 mg 3 times daily adjusted according to response
- Nausea and vomiting, see Prescribing in Palliative Care, p. 22
  - By intramuscular or intravenous injection, 1–2 mg

**Haloperidol** (Non-proprietary)

- Tablets, haloperidol 500 micrograms, net price 28-tab pack = 91p; 1.5 mg, 28-tab pack = £1.39; 5 mg, 28-tab pack = £2.15; 10 mg, 28-tab pack = £5.53; 20 mg, 28-tab pack = £14.07. Label: 2
- **Injection**, haloperidol 5 mg/mL, net price 1-mL amp = 37p

**Dozic** (Rosemont)

- Oral liquid, sugar-free, haloperidol 1 mg/mL, net price 100-mL pack = £6.86. Label: 2

**Haldol** (Janssen-Cilag)

- Tablets, both scored, haloperidol 5 mg (blue), net price 100 = £7.21; 10 mg (yellow), 100 = £14.08. Label: 2
4.2.1 Antipsychotic drugs

**Oral liquid**, sugar-free, haloperidol 2 mg/mL, net price 100-mL pack (with pipette) = £4.45. Label: 2

**Injection**, haloperidol 5 mg/mL, net price 1-mL amp = 37p

**Serentan**

**Capsules**, green, haloperidol 500 micrograms, net price 30-cap pack = 98p. Label: 2

**Tablets**, haloperidol 1.5 mg, net price 30-tab pack = £1.74; 5 mg (pink), 30-tab pack = £3.95; 10 mg (pale pink), 30-tab pack = £6.76. Label: 2

**Oral liquid**, sugar-free, haloperidol 2 mg/mL, net price 500-mL pack = £34.48. Label: 2

- **Depot preparation**
  - **Section 4.2.2**

**LEVOMEPROMAZINE**

(Methotrimeprazine)

- **Indications** see under Dose
- **Cautions** see notes above; diabetes; patients receiving large initial doses should remain supine
- **Elderly** Risk of postural hypotension, not recommended for ambulant patients over 50 years unless risk of hypotensive reaction assessed
- **Contra-indications** see notes above
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above
- **Pregnancy** see notes above
- **Breast-feeding** see notes above
- **Side-effects** see notes above; occasionally raised erythrocyte sedimentation rate occurs; hyperglycaemia also reported

**Dose**

- Schizophrenia, by mouth initially 25–50 mg daily in divided doses increased as necessary; bedpatients initially 100–200 mg daily usually in 3 divided doses, increased if necessary to 1 g daily; ELDERLY, see Cautions
- Pain in palliative care, see p. 21
- Restlessness and confusion in palliative care, see p. 23; CHILD 1–18 years, see **BNF for Children**
- Nausea and vomiting in palliative care, by mouth, see p. 22, or by subcutaneous infusion, see p. 23; CHILD 1 month–18 years, see **BNF for Children**

**Nozinar**

(Sanoﬁ-Aventis) [35]

**Tablets**, scored, levomepromazine maleate 25 mg, net price 84-tab pack = £9.23; 10 mg, 84-tab pack = £24.95. Label: 2

**Syrup**, brown, levomepromazine 10 mg/5 mL, net price 100-mL pack = £12.08. Label: 2

**PERICYZANE**

(Pericyazine)

- **Indications** see under Dose
- **Cautions** see notes above; hypothyroidism
- **Contra-indications** see notes above; also agitation and restlessness in the elderly
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above
- **Pregnancy** see notes above
- **Breast-feeding** see notes above
- **Side-effects** see notes above; less sedating; extrapyramidal symptoms, especially dystonia, more frequent, particularly at high dosage; rarely systemic lupus erythematosus

**Dose**

- Schizophrenia and other psychoses, mania, short-term adjunctive management of anxiety, severe psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, initially 15–30 mg (elderly 5–10 mg) daily divided into 2 doses, taking the larger dose at bedtime, adjusted according to response; CHILD not recommended

**Fentazin**

(Goldshield) [35]

**Tablets**, s/c, perphenazine 2 mg, net price 100 = £22.38; 4 mg, 100 = £26.34. Label: 2

**PERPHENAZINE**

- **Indications** see under Dose
- **Cautions** see notes above
- **Contra-indications** see notes above; also prolonged QT interval

**BNF 61**

**PIMOZIDE**

- **Indications** see under Dose
- **Cautions** see notes above; ECG monitoring
- **Contra-indications** see notes above; also prolonged QT interval
- **Hepatic impairment** see notes above
- **Renal impairment** see notes above
- **Pregnancy** see notes above
- **Breast-feeding** see notes above

steps of 25 mg according to response; usual max. 300 mg daily (elderly initially 15–30 mg daily); CHILD and INFANT over 1 year (schizophrenia or behavioural disorders only), initially, 500 micrograms daily for 10-kg child, increased by 1 mg for each additional 5 kg body-weight to max. total daily dose of 10 mg; dose may be gradually increased according to response but maintenance should not exceed twice initial dose

- Short-term adjunctive management of severe anxiety, psychomotor agitation, and violent or dangerously impulsive behaviour, initially 15–30 mg (elderly 5–10 mg) daily divided into 2 doses, taking the larger dose at bedtime, adjusted according to response; CHILD not recommended

**label:** 2
**Side-effects** see notes above; less sedating; serious arrhythmias reported; glycosuria and, rarely, hypotraemia reported

**Dose**
- Schizophrenia, **ADULT** and **CHILD** over 12 years, initially 2–4 mg daily, increased according to response in steps of 2–4 mg at intervals of not less than 1 week; usual dose range 2–20 mg daily; **ELDERLY** half usual starting dose
- Monosymptomatic hypochondriacal psychosis, paranoia psychosis, **ADULT** and **CHILD** over 12 years, initially 4 mg daily, increased according to response in steps of 2–4 mg at intervals of not less than 1 week; max. 16 mg daily; **ELDERLY** half usual starting dose
- **Orap** (Janssen-Cilag) (Non-proprietary) Tablets, scored, green, pimozide 4 mg, net price 100 = £26.87. Label: 2

### PROCHLORPERAZINE

**Indications** see under Dose; antiemetic (section 4.6)

**Cautions** see notes above; also hypotension more likely after intramuscular injection

**Contra-indications** see notes above; children, but see section 4.6 for use as antiemetic

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; less sedating; extrapyramidal symptoms, particularly dystonias, more frequent; respiratory depression may occur in susceptible patients

**Dose**
- By mouth, schizophrenia and other psychoses, mania, prochlorperazine maleate or mesilate, 12.5 mg twice daily for 7 days adjusted at intervals of 4–7 days to usual dose of 75–100 mg daily according to response; **CHILD** not recommended
- Short-term adjunctive management of severe anxiety, 15–20 mg daily in divided doses; max. 40 mg daily; **CHILD** not recommended
- By deep intramuscular injection, psychoses, mania, prochlorperazine mesilate 12.5–25 mg 2–3 times daily; **CHILD** not recommended

### PROMAZINE HYDROCHLORIDE

**Indications** see under Dose

**Cautions** see notes above; also cerebral arteriosclerosis

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also haemolytic anaemia

**Dose**
- Short-term adjunctive management of psychomotor agitation, 100–200 mg 4 times daily; **CHILD** not recommended
- Agitation and restlessness in elderly, 25–50 mg 4 times daily

### SULPIRIDE

**Indications** schizophrenia

**Cautions** see notes above; also excited, agitated, or aggressive patients (even low doses may aggravate symptoms)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also hepatitis

**Dose**
- **ADULT** and **CHILD** over 14 years, 200–400 mg twice daily; max. 800 mg daily in predominantly negative symptoms, and 2.4 g daily in mainly positive symptoms; **ELDERLY** lower initial dose, increased gradually according to response

**Sulpiride** (Non-proprietary) Tablets, sulphiride 200 mg, net price 30-tab pack = £8.09, 56-tab pack = £6.46; 400 mg, 30-tab pack = £18.57. Label: 2

**Dolmatil** (Sanofi-Aventis) Tablets, both scored, sulphiride 200 mg, net price 100-tab pack = £13.31; 400 mg (f/c), 100-tab pack = £34.87. Label: 2

**Sulpor** (Rosemont) Oral solution, sugar-free, lemon- and aniseed-flavoured, sulphiride 200 mg/5 mL, net price 150 mL = £25.38. Label: 2

### TRIFLUOPERAZINE

**Indications** see under Dose; antiemetic (section 4.6)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; extrapyramidal symptoms more frequent, especially at doses exceeding 6 mg daily; anorexia; muscle weakness

**Dose**
- Schizophrenia and other psychoses, short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, **ADULT** and **CHILD** over 12 years, initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to the response; **ELDERLY** reduce initial dose by at least half
- Short-term adjunctive management of severe anxiety, **ADULT** and **CHILD** over 12 years, 2–4 mg daily in divided doses, increased if necessary to 6 mg daily; **CHILD** 3–5 years up to 1 mg daily, 6–12 years up to 4 mg daily; **ELDERLY** reduce initial dose by at least half

**Trifluoperazine** (Non-proprietary) Tablets, coated, trifluoperazine (as hydrochloride) 1 mg, net price 112-tab pack = £6.57; 5 mg, 112-tab pack = £4.89. Label: 2
222 4.2.1 Antipsychotic drugs

Oral solution, trifluoperazine (as hydrochloride) 5 mg/mL, net price 150 mL = £10.84. Label: 2

Stelazine® (Goldshield) [fs]
TABLETS, both blue, f/c, trifluoperazine (as hydrochloride) 1 mg, net price 112 = £3.43; 5 mg, 112 = £4.89. Label: 2

Syrup, sugar-free, yellow, trifluoperazine (as hydrochloride) 1 mg/5 mL, net price 200-mL pack = £2.95. Label: 2

**ZUCLOPENTHIXOL ACETATE**

**Indications** short-term management of acute psychosis, mania, or exacerbations of chronic psychosis

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- By deep intramuscular injection into the gluteal muscle or lateral thigh, 50–150 mg (ELDERLY 50–100 mg), if necessary repeated after 2–3 days (1 additional dose may be needed 1–2 days after the first injection); max. cumulative dose 400 mg per course and max. 4 injections; max. duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate; **CHILD** not recommended

**Clopixol Acuphase® (Lundbeck) [fs]
Injection (oily), zuclopenthixol acetate 50 mg/mL, net price 1–mL amp. = £2.17; 2–mL amp. = £2.94

**Depot preparation** Section 4.2.2

**ZUCLOPENTHIXOL**

**Indications** schizophrenia and other psychoses

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above; apathetic or withdrawn states

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; urinary frequency or incontinence; weight loss (less common than weight gain)

**Dose**
- By mouth, initially 20–30 mg daily in divided doses, increasing to a max. of 150 mg daily if necessary; usual maintenance dose 20–50 mg daily; max. single dose 40 mg; ELDERLY (or debilitated) initially quarter to half adult dose; **CHILD** not recommended

**Clopixol® (Lundbeck) [fs]
Tablets, f/c, zuclopenthixol (as dihydrochloride) 2 mg (red), net price 100 = £3.14; 10 mg (light red-brown), 100 = £5.64; 25 mg (red-brown), 100 = £7.22. Label: 2

**Depot preparation** Section 4.2.2

**Atypical antipsychotic drugs**

The ‘atypical’ antipsychotic drugs amisulpride, aripiprazole, clozapine, olanzapine, paliperidone, quetiapine, and risperidone may be better tolerated than other antipsychotic drugs; extrapyramidal symptoms may be less frequent than with older antipsychotic drugs.

Aripiprazole, clozapine, olanzapine, and quetiapine cause little or no elevation of prolactin concentration; when changing from other antipsychotic drugs, a reduction in prolactin may increase fertility.

Clozapine is licensed for the treatment of schizophrenia only in patients unresponsive to, or intolerant of, conventional antipsychotic drugs. It can cause agranulocytosis and its use is restricted to patients registered with a clozapine patient monitoring service (see under Clozapine).

The Scottish Medicines Consortium (p. 4) has advised (April 2009) that quetiapine (Seroquel®) is not recommended for use within NHS Scotland for the treatment of major depressive episodes associated with bipolar disorder.

**NICE guidance Atypical antipsychotics for schizophrenia (June 2002) and schizophrenia (March 2009)**

NICE has recommended that:
- the atypical antipsychotics (amisulpride, olanzapine, quetiapine, risperidone, and zotepine) should be considered when choosing first-line treatment of newly diagnosed schizophrenia;
- an atypical antipsychotic is considered the treatment option of choice for managing an acute schizophrenic episode when discussion with the individual is not possible;
- an atypical antipsychotic should be considered for an individual who is suffering unacceptable side-effects from a conventional antipsychotic;
- an atypical antipsychotic should be considered for an individual in relapse whose symptoms were previously inadequately controlled;
- changing to an atypical antipsychotic is not necessary if a conventional antipsychotic controls symptoms adequately and the individual does not suffer unacceptable side-effects;
- clozapine should be introduced if schizophrenia is inadequately controlled despite the sequential use of two or more antipsychotics (one of which should be an atypical antipsychotic) each for at least 6–8 weeks.
- If symptoms do not respond adequately to an optimised dose of clozapine, measure clozapine plasma levels before adding a second antipsychotic to augment clozapine. If a second antipsychotic is added, there should be 8–10 weeks treatment duration to assess for response.

**Cautions and contra-indications** While atypical antipsychotic drugs have not generally been associated with clinically significant prolongation of the QT interval, they should be used with care if prescribed with other drugs that increase the QT interval. Atypical antipsychotic drugs should be used with caution in patients with cardiovascular disease, or a history of epilepsy; they should be used with great caution in the elderly (see p. 216); **Interactions**: Appendix 1 (antipsychotics).
Driving  Atypical antipsychotic drugs may affect performance of skilled tasks (e.g. driving); effects of alcohol are enhanced.

Withdrawal  Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse.

Side-effects  Side-effects of the atypical antipsychotic drugs include weight gain, dizziness, postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients, extrapyramidal symptoms (usually mild and transient and which respond to dose reduction or to an antimuscarinic drug), and occasionally tardive dyskinesia on long-term administration (discontinue drug on appearance of early signs); venous thromboembolism has been reported. Hyperglycaemia and sometimes diabetes can occur, particularly with clozapine, olanzapine, and risperidone; monitoring weight and plasma-glucose concentration may identify the development of hyperglycaemia. Neuroleptic malignant syndrome has been reported rarely. Hyposalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication] (p. 256), provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

AMISULPRIDE

Indications  schizophrenia

Cautions  see notes above; also Parkinson’s disease

Contra-indications  see notes above; also phaeochromocytoma, prolactin-dependent tumours

Renal impairment  halve dose if eGFR 30–60 mL/minute/1.73 m²; use one-third dose if eGFR 10–30 mL/minute/1.73 m²; no information available if eGFR less than 10 mL/minute/1.73 m²

Pregnancy  avoid

Breast-feeding  avoid—no information available

Side-effects  see notes above; gastro-intestinal disturbances; tachycardia; fatigue, insomnia, akathisia, drowsiness, restlessness, tremor, headache, asthenia; blurred vision; less commonly depression; very rarely anorexia, dysphagia, oropharyngeal spasm, laryngospasm, hepatitis, jaundice, hyperprolactinaemia; occasionally bradycardia; rarely seizures

Dose  ● Acute psychotic episode, 400–800 mg daily in 2 divided doses, adjusted according to response; max. 1.2 g daily; CHILD under 15 years not recommended
  ● Predominantly negative symptoms, 50–300 mg daily; CHILD under 15 years not recommended

Amisulpride  (Non-proprietary)  Tablets, amisulpride 50 mg, net price 60-tab pack = £7.18; 100 mg, 60-tab pack = £31.74; 200 mg, 60-tab pack = £16.47; 400 mg, 60-tab pack = £105.68.

Label: 2

Solan®  (Sanofi-Aventis)  Tablets, scored, amisulpride 50 mg, net price 60-tab pack = £22.76; 100 mg, 60-tab pack = £35.29; 200 mg, 60-tab pack = £58.99; 400 mg, 60-tab pack = £117.97.

Label: 2

Solution, 100 mg/mL, net price 60 mL (caramel flavour) = £33.76. Label: 2

ARIPIPRAZOLE

Indications  see under Dose

Cautions  see notes above; cerebrovascular disease; elderly (reduce initial dose)

Contra-indications  see notes above

Hepatic impairment  use with caution in severe impairment

Pregnancy  use only if potential benefit outweighs risk—no information available

Breast-feeding  avoid—present in milk in animal studies

Side-effects  see notes above; gastrointestinal disturbances; tachycardia; fatigue, insomnia, akathisia, drowsiness, restlessness, tremor, headache, asthenia; blurred vision; less commonly depression; very rarely anorexia, dysphagia, oropharyngeal spasm, laryngospasm, hepatitis, jaundice, hyperprolactinaemia; occasionally bradycardia, hypertension, chest pain, agitation, anxiety, speech disorder, suicidal ideation, seizures, hyponatraemia, stiffness, myalgia, rhabdomyolysis, priapism, urinary retention and incontinence, blood disorders, sweating, alopecia, photosensitivity reactions, rash, weight loss, and impaired temperature regulation; with injection, dry mouth

Dose  ● Schizophrenia, by mouth, ADULT over 18 years 10–15 mg once daily, usual maintenance 15 mg once daily; max. 30 mg once daily; CHILD 15–18 years, initially 2 mg once daily for 2 days, then 5 mg once daily for 2 days, then 10 mg daily; thereafter increased if necessary in steps of 5 mg to max. 30 mg daily
  ● Treatment and prevention of mania, by mouth, ADULT over 18 years, 15 mg once daily; increased if necessary; max. 30 mg once daily
  ● Control of agitation and disturbed behaviour in schizophrenia, by intramuscular injection, ADULT over 18 years, initially 5.25–15 mg (usual dose 9.75 mg) as a single dose followed by 5.25–15 mg after 2 hours if necessary; max. 3 injections daily; max. daily combined oral and parental dose 30 mg

Abilify®  (Bristol-Myers Squibb)  Tablets, aripiprazole 5 mg (blue), net price 28-tab pack = £95.74; 10 mg (pink), 28-tab pack = £95.74; 15 mg (yellow), 28-tab pack = £95.74, 28-tab pack = £191.47. Label: 2

Orodispersible tablets, aripiprazole 10 mg (pink), net price 28-tab pack = £95.74; 15 mg (yellow), 28-tab pack = £95.74. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling  Tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed

Oral solution, aripiprazole 1 mg/mL, net price 150 mL with measuring cup = £102.57. Label: 2

Injection, aripiprazole 7.5 mg/mL, net price 1.3-mL (9.75-mg) vial = £3.42

CLOZAPINE

Indications  schizophrenia (including psychosis in Parkinson’s disease) in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

Cautions  see notes above; elderly; monitor leucocyte and differential blood counts (see Agranulocytosis, below); prostatic hypertrophy, susceptibility to angle-closure glaucoma; taper off other antipsychotics
before starting; close medical supervision during initiation (risk of collapse because of hypotension); dose adjustment may be necessary if smoking started or stopped during treatment

Withdrawal

On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.

Agranulocytosis

Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation), if leucocyte count below 3000/mm³ or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucocytes; patients should report immediately symptoms of infection, especially influenza-like illness

Myocarditis and cardiomyopathy

Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.

- Perform physical examination and take full medical history before starting
- Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
- Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
- If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
- Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy

Gastro-intestinal obstruction

Reactions resembling gastro-intestinal obstruction reported. Clozapine should be used cautiously with drugs which cause constipation (e.g. antimuscarinic drugs) or in history of colonic disease or bowel surgery. Monitor for constipation and prescribe laxative if required.

Contra-indications

severe cardiac disorders (e.g. myocarditis; see Cautions); history of neutropenia or agranulocytosis (see Cautions); bone-marrow disorders; paralytic ileus (see Cautions); alcoholic and toxic psychoses; history of circulatory collapse; drug intoxication; coma or severe CNS depression; uncontrolled epilepsy

Hepatic impairment

monitor hepatic function regularly; avoid in symptomatic or progressive liver disease or hepatic failure

Renal impairment

avoid in severe impairment

Pregnancy

use with caution

Breast-feeding

avoid

Side-effects

see notes above; also constipation (see Cautions); hypersalivation, dry mouth, nausea, vomiting, anorexia; tachycardia, ECG changes, hypertensive; drowsiness, dizziness, headache, tremor, seizures, fatigue, impaired temperature regulation; urinary incontinence and retention; leukopenia, eosinophilia, leucocytosis; blurred vision, sweating; less commonly agranulocytosis (important: see Cautions); rarely dysphagia, hepatitis, cholestatic jaundice, pancreatitis, circulatory collapse, arrhythmia, myocarditis (important: see Cautions); peri-carditis, thromboembolism, agitation, confusion, delirium, anaemia; very rarely parotid gland enlargement, intestinal obstruction (see Cautions), cardiomyopathy, myocardial infarction, respiratory depression, priapism, intermittent nephritis, thrombocytopenia, thrombocytopenia, hyperglycaemia, hypercholesterolaemia, hyperlipidaemia, angle-closure glaucoma, fulminant hepatic necrosis, and skin reactions

Dose

- Schizophrenia, ADULT over 16 years, 12.5 mg once or twice (ELDERLY 12.5 mg once) on first day then 25–50 mg (ELDERLY 25–37.5 mg) on second day then increased gradually (if well tolerated) in steps of 25–50 mg daily (ELDERLY max. increment 25 mg daily) over 14–21 days up to 300 mg daily in divided doses (larger dose at night, up to 200 mg daily may be taken as a single dose at bedtime); if necessary may be further increased in steps of 50–100 mg once (preferably) or twice weekly, usual dose 200–450 mg daily (max. 900 mg daily)

Note Restoring after interval of more than 2 days, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

- Psychosis in Parkinson’s disease, ADULT over 16 years, 12.5 mg at bedtime then increased according to response in steps of 12.5 mg up to twice weekly; usual dose range 25–37.5 mg at bedtime, usual max. 50 mg daily; exceptionally, dose may be increased further in steps of 12.5 mg weekly to max. 100 mg daily in 1–2 divided doses

Clozaril® (Novartis) (NW)

Tablets, yellow, clozapine 25 mg (scored), net price 28-tab pack = £5.40, 84-tab pack (hosp. only) = £16.18, 100-tab pack (hosp. only) = £19.26; 100 mg, 28-tab pack = £21.56, 84-tab pack (hosp. only) = £64.68, 100-tab pack (hosp. only) = £77.00. Label: 2, 10, patient information leaflet

Note Patient, prescriber, and supplying pharmacist must be registered with the Clozaril Patient Monitoring Service—takes several days to do this

Denzapine® (Merz) (NW)

Tablets, yellow, scored, clozapine 25 mg, net price 28-tab pack = £6.17, 84-tab pack = £16.64, 100-tab pack = £19.80; 50 mg, 50-tab pack = £19.80; 100 mg, 28-tab pack = £24.64, 84-tab pack = £66.53, 100-tab pack = £79.20; 200 mg, 50-tab pack = £79.20. Label: 2, 10, patient information leaflet

Suspension, clozapine 50 mg/mL, net price 100 mL = £59.60. Label: 2, 10, patient information leaflet, counselling, administration

Counselling

Shake well for 90 seconds when dispensing or if visibly settled; otherwise shake well for 10 seconds before use

Note May be diluted with water

Note Patient, prescriber, and supplying pharmacist must be registered with the Denzapine Patient Monitoring Service—takes several days to do this

Zaponex® (TEVA UK) (NW)

Tablets, yellow, scored, clozapine 25 mg, net price 84-tab pack = £8.28; 100 mg, 84-tab pack = £33.88. Label: 2, 10, patient information leaflet

Note Patient, prescriber, and supplying pharmacist must be registered with the Zaponex Treatment Access System—takes several days to do this
marrow depression, hypereosinophilic disorders, myeloproliferative disease, Parkinson’s disease; dose adjustment may be necessary if smoking started or stopped during treatment

**CNS and respiratory depression** Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also receiving another antipsychotic or benzodiazepine

**Contra-indications for injection**, acute myocardial infarction, unstable angina, severe hypotension or bradycardia, sick sinus syndrome, recent heart surgery

**Hepatic impairment** consider initial dose of 5 mg daily

**Renal impairment** consider initial dose of 5 mg daily

**Pregnancy** use only if potential benefit outweighs risk—present in milk

**Breast-feeding** avoid—present in milk

**Side-effects** see notes above; also dry mouth, constipation, dyspepsia; tachycardia, hypertension, electrolyte abnormalities; rarely seizures, leucopenia, and rash; very rarely hepatitis, pancreatitis, thromboembolism, hypercholesterolaemia, hypothyroidism, urinary retention, priapism, thrombocytopenia, neutropenia, rhabdomyolysis, and alopecia; with injection, sinus pause and hypovolaemia

**Dose**

- Schizophrenia, combination therapy for mania, preventing recurrence in bipolar disorder, by mouth, **ADULT** over 18 years, 10 mg daily adjusted to usual range of 5–20 mg daily; doses greater than 10 mg daily only after reassessment; max. 20 mg daily; **CHILD** 12–18 years, see BNF for Children
- Monotherapy for mania, by mouth, **ADULT** over 18 years, 15 mg daily adjusted to usual range of 5–20 mg daily; doses greater than 15 mg daily only after reassessment; max. 20 mg daily; **CHILD** 12–18 years, see BNF for Children
- Control of agitation and disturbed behaviour in schizophrenia or mania, by intramuscular injection, **ADULT** over 18 years, initially 5–10 mg (usual dose 10 mg) as a single dose followed by 5–10 mg after 2 hours if necessary; **ELDERLY** initially 2.5–5 mg as a single dose followed by 2.5–5 mg after 2 hours if necessary; max. 3 injections daily for 3 days; max. daily combined oral and parenteral dose 20 mg

**Note** When one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

**Contraindications**

- Pregnancy
- Renal impairment
- Hepatic impairment
- Breast-feeding

**Drug interactions**

- Contra-indications
- Cautions
- Indications
- Dose
- Side-effects
- Contraindications
- Cautions
- Indications
- Dose
- Side-effects

**Depot preparation**

**Note** Paliperidone is a metabolite of risperidone

**Indications** schizophrenia

**Cautions** see notes above; predisposition to gastrointestinal obstruction; elderly patients with dementia and risk factors for stroke; Parkinson’s disease

**Hepatic impairment** caution in severe impairment—no information available

**Renal impairment** initially 3 mg once daily if eGFR 50–80 mL/minute/1.73 m² (max. 6 mg once daily); initially 1.5 mg once daily if eGFR 10–50 mL/minute/1.73 m² (max. 3 mg once daily); avoid if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** use only if potential benefit outweighs risk—toxicity in animal studies; if discontinuation during pregnancy is necessary, withdraw gradually

**Breast-feeding** avoid—present in milk

**Side-effects** see notes above; also abdominal pain, dry mouth, hypersalivation, vomiting; tachycardia, bradycardia, first-degree AV block, bundle branch block, drowsiness, agitation, headache, asthenia; less commonly palpitation, arrhythmias, ischaemia, oedema, seizures, nightmare, syncope, menstrual disturbances, erectile dysfunction, galactorrhoea, gynaecomastia, and rash; cerebrovascular accident also reported

**Dose**

- **ADULT** over 18 years, 6 mg once daily in the morning, adjusted if necessary in increments of 3 mg over at least 5 days; usual range 3–12 mg daily
- **Counselling** Always take with breakfast or always take on an empty stomach

**Invega** (Janssen-Cilag)

**Tablets**, m/c, paliperidone 3 mg (white), net price 28-tab pack = £97.28; 6 mg (beige), 28-tab pack = £97.28; 9 mg (pink), 28-tab pack = £145.92. Label: 2, 25, counselling, administration

**QUETIAPINE**

**Indications** schizophrenia; mania, either alone or with mood stabilisers; depression in bipolar disorder; adjunctive treatment in major depressive disorder

**Cautions** see notes above; also cerebrovascular disease; patients at risk of aspiration pneumonia; treatment of depression in patients under 25 years (increased risk of suicide)

**Hepatic impairment** for immediate-release tablets, initially 25 mg daily, increased daily in steps of 25–50 mg; for modified-release tablets, initially 50 mg daily, increased daily in steps of 50 mg

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** avoid—no information available

**Side-effects** see notes above; also dry mouth, constipation, dyspepsia; tachycardia, hypertension, elevated plasma-triglyceride and -cholesterol concentrations, peripheral oedema; drowsiness, headache,
irritability, dysarthria, asthenia; hyperprolactinaemia; leucopenia, neutropenia; blurred vision; rhinitis; less commonly dysphagia, seizures, restless legs syndrome, and eosinophilia; rarely jaundice and priapism; very rarely hepatitis, angioedema, and Stevens-Johnson syndrome; suicidal behaviour (particularly on initiation) also reported.

**Dose**

- **Schizophrenia.** ADULT over 18 years, 25 mg twice daily on day 1, 50 mg twice daily on day 2. 100 mg twice daily on day 3, 150 mg twice daily on day 4, then adjusted according to response, usual range 300–450 mg daily in 2 divided doses; max. 750 mg daily; ELDERLY initially 25 mg daily as a single dose, increased in steps of 25–50 mg daily in 2 divided doses;

- **Treatment of mania in bipolar disorder.** ADULT over 18 years, 50 mg twice daily on day 1, 100 mg twice daily on day 2, 150 mg twice daily on day 3, 200 mg twice daily on day 4, then adjusted according to response in steps of up to 200 mg daily to max. 800 mg daily; usual range 400–800 mg daily in 2 divided doses; ELDERLY initially 25 mg daily as a single dose, increased in steps of 25–50 mg daily in 2 divided doses;

- **Treatment of depression in bipolar disorder.** ADULT over 18 years, 50 mg once daily (at bedtime) on day 1, 100 mg once daily on day 2, 200 mg once daily on day 3, 300 mg once daily on day 4; adjust according to response, usual dose 300 mg once daily, max. 600 mg daily;

- **Prevention of mania and depression in bipolar disorder.** ADULT over 18 years, continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual range 300–800 mg in 2 divided doses.

**Seroquel® (AstraZeneca)**

- **Tablets.** f/c, quetiapine (as fumarate) 25 mg (peach), net price 60-tab pack = £33.83; 100 mg (yellow), 60-tab pack = £113.10; 150 mg (pale yellow), 60-tab pack = £113.10; 200 mg (white), 60-tab pack = £113.10; 300 mg (white), 60-tab pack = £170.00. Label: 2

**Risperidone**

**Indications**

- **Early and chronic psychoses, mania; short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer’s dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others; short-term treatment (up to 6 weeks) of persistent aggression in conduct disorder (under specialist supervision)**

**Cautions**

- see notes above; Parkinson’s disease; dementia with Lewy bodies; dehydration; avoid in acute porphyria (section 9.8.2)

**Hepatic impairment**

- initial and subsequent oral doses should be halved

**Renal impairment**

- initial and subsequent oral doses should be halved

**Pregnancy**

- use only if potential benefit outweighs risk; extrapyramidal effects reported in neonates when taken in third trimester

**Breast-feeding**

- use only if potential benefit outweighs risk—small amount present in milk

**Side-effects**

- see notes above; also gastro-intestinal disturbances (including diarrhoea, constipation, nausea and vomiting, dyspepsia, abdominal pain), dry mouth; dysphoria; drowsiness, asthenia, tremor, sleep disturbances, agitation, anxiety, headache; urinary incontinence; arthralgia, myalgia; abnormal vision; epistaxis; rash; less commonly anorexia, ECG changes, hypoesthesia, impaired concentration, hyperprolactinaemia (with galactorrhoea, menstrual disturbances, gynaecomastia), sexual dysfunction, blood disorders, tinnitus, angioedema; rarely intestinal obstruction, pancreatitis, jaundice, seizures, hyponatraemia, abnormal temperature regulation; oedema and priapism also reported

**Dose**

- **Psychoses.** 2 mg in 1–2 divided doses on first day then 4 mg in 1–2 divided doses on second day (slower titration appropriate in some patients); usual dose range 4–6 mg daily; doses above 10 mg daily only if benefit considered to outweigh risk (max. 16 mg daily); ELDERLY initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily; CHILD 12–18 years see BNF for Children

- **Mania.** initially 2 mg once daily, increased if necessary in steps of 1 mg daily; usual dose range 1–6 mg daily; ELDERLY initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily

- **Persistent aggression in Alzheimer’s dementia,** initially 250 micrograms twice daily, increased according to response in steps of 250 micrograms twice daily on alternate days; usual dose 500 micrograms twice daily (up to 1 mg twice daily has been reported)

- **Persistent aggression in conduct disorder.** CHILD over 5 years, body-weight under 50 kg, initially 250 micrograms once daily, increased according to response in steps of 250 micrograms on alternate days; usual dose 500 micrograms once daily (up to 750 micrograms once daily has been reported); CHILD over 5 years, body-
weight over 50 kg, initially 500 micrograms once daily, increased according to response in steps of 500 micrograms on alternate days; usual dose 1 mg daily (up to 1.5 mg once daily has been required).

**Risperidone** (Non-proprietary) ▼ [Tab]

Tablets, risperidone 500 micrograms, net price 20-tab pack = £97.9p; 1 mg, 20-tab pack = £1.18, 60-tab pack = £1.70; 2 mg, 60-tab pack = £2.13; 3 mg, 60-tab pack = £2.71; 4 mg, 60-tab pack = £3.52; 6 mg, 28-tab pack = £4.12. Label: 2.

**Orodispersible tablets**, risperidone 0.5 mg, net price 28-tab pack = £16.68; 1 mg, 28-tab pack = £20.51; 2 mg, 28-tab pack = £37.72; 3 mg, 28-tab pack = £41.39; 4 mg, 28-tab pack = £15.20. Label: 2, counselling, administration.

**Counselling** Tablets should be placed on the tongue, allowed to dissolve and swallowed.

**Liquid**, risperidone 1 mg/mL, net price 100-mL pack = £57.40. Label: 2, counselling, use of dose syringe.

**Note** Liquid may be diluted with any non-alcoholic drink, except tea.

**Risperdal®** (Janssen-Cilag) ▼ [Tab]

Tablets, f/c, scored, risperidone 500 micrograms (brown-red), net price 20-tab pack = £5.08; 1 mg (white), 20-tab pack = £8.36, 60-tab pack = £25.08; 2 mg (orange), 60-tab pack = £49.46; 3 mg (yellow), 60-tab pack = £72.73; 4 mg (green), 60-tab pack = £96.00; 6 mg (yellow), 28-tab pack = £157.88. Label: 2.

**Orodispersible tablets** (Quicklet®), pink, risperidone 500 micrograms, net price 28-tab pack = £8.23; 1 mg, 28-tab pack = £17.32; 2 mg, 28-tab pack = £32.65; 3 mg, 28-tab pack = £56.24; 4 mg, 28-tab pack = £66.68. Label: 2, counselling, administration.

**Excipients** include aspartame (section 9.4.1)

**Counselling** Tablets should be placed on the tongue, allowed to dissolve and swallowed.

**Liquid**, risperidone 1 mg/mL, net price 100 mL pack = £52.87. Label: 2, counselling, use of dose syringe.

**Note** Liquid may be diluted with any non-alcoholic drink, except tea.

**Depot preparation**

Section 4.2.2

### 4.2.2 Antipsychotic depot injections

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with atypical antipsychotic depot preparations, such as risperidone and olanzapine embonate.

**Administration** Depot antipsychotics are administered by deep intramuscular injection at intervals of 1 to 4 weeks. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged. In general not more than 2–3 mL of oily injection should be administered at any one site; correct injection technique (including the use of z-track technique) and rotation of injection sites are essential. If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

### Dosage

Individual responses to neuroleptic drugs are very variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient’s response. For the advice of The Royal College of Psychiatrists on doses above the BNF upper limit, see p. 215.

### Equivalent doses of depot antipsychotics

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

<table>
<thead>
<tr>
<th>Antipsychotic drug</th>
<th>Dose (mg)</th>
<th>Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flupentixol decanoate</td>
<td>40</td>
<td>2 weeks</td>
</tr>
<tr>
<td>Fluphenazine decanoate</td>
<td>25</td>
<td>2 weeks</td>
</tr>
<tr>
<td>Haloperidol (as decanoate)</td>
<td>100</td>
<td>4 weeks</td>
</tr>
<tr>
<td>Pipotiazine palmitate</td>
<td>50</td>
<td>4 weeks</td>
</tr>
<tr>
<td>Zuclopenthixol decanoate</td>
<td>200</td>
<td>2 weeks</td>
</tr>
</tbody>
</table>

**Important** These equivalences must not be extrapolated beyond the maximum dose for the drug.

### Choice

There is no clear-cut division in the use of the conventional antipsychotics, but zuclopenthixol may be suitable for the treatment of agitated or aggressive patients whereas flupentixol can cause over-excitation in such patients. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

### Cautions

See section 4.2.1. Treatment requires careful monitoring for optimum effect. When transferring from oral to depot therapy, the dose by mouth should be reduced gradually.

### Contra-indications

See section 4.2.1. Do not use in children.

### Side-effects

See section 4.2.1. Pain may occur at injection site and occasionally erythema, swelling, and nodules. For side-effects of specific antipsychotics see under the relevant drug.

### FLUPENTIXOL DECANOATE

(Fupentixol Decanoate)

**Indications** maintenance in schizophrenia and other psychoses.

**Cautions** see Flupentixol (section 4.2.1) and notes above; an alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear.

**Contra-indications** see Flupentixol (section 4.2.1) and notes above.

**Hepatic impairment** see section 4.2.1.

**Renal impairment** see section 4.2.1.

**Pregnancy** see section 4.2.1.

**Breast-feeding** see section 4.2.1.

**Side-effects** see Flupentixol (section 4.2.1) and notes above, but may have a mood elevating effect.
228 4.2.2 Antipsychotic depot injections

Dose
- By deep intramuscular injection into the upper outer buttck or lateral thigh, test dose 20 mg, then after at least 7 days 20–40 mg repeated at intervals of 2–4 weeks, adjusted according to response; max. 400 mg weekly; usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; ELDERLY initially quarter to half adult dose; CHILD not recommended

Depixol® (Lundbeck) injection (oily), fluphenazine decanoate 20 mg/mL, net price 1-mL amp = £1.28; 2-mL amp = £2.49
Depixol Conc.® (Lundbeck) injection (oily), fluphenazine decanoate 100 mg/mL, net price 0.5-mL amp = £1.53; 1-mL amp = £1.84
Depixol Low Volume® (Lundbeck) injection (oily), fluphenazine decanoate 200 mg/mL, net price 1-mL amp = £3.01

FLUPHENAZINE DECANOATE

Indications maintenance in schizophrenia and other psychoses
Cautions see section 4.2.1 and notes above; less sedating and fewer antimuscarinic or hypotensive symptoms, but extrapyramidal symptoms, particularly dystonic reactions and akathisia, more frequent; systemic lupus erythematosus, inappropriate antidiuretic hormone secretion, and oedema also reported; extrapyramidal symptoms usually appear a few hours after injection and continue for about 2 days but may be delayed
Hepatic impairment see section 4.2.1; avoid in hepatic failure
Renal impairment see section 4.2.1; manufacturer advises caution, avoid in renal failure
Pregnancy see section 4.2.1
Breast-feeding see section 4.2.1
Side-effects see section 4.2.1 and notes above; also marked cerebral atherosclerosis

Dose
- By deep intramuscular injection into the gluteal muscle, test dose 12.5 mg (6.25 mg in elderly), then after 4–7 days 12.5–100 mg repeated at intervals of 2–4 weeks; QT-interval prolongation (avoid concomitant drugs that prolong QT interval) not recommended

Note if 2-weekly administration preferred, doses should be halved

Haldol Decanoate® (Janssen-Cilag) injection (oily), haloperidol (as decanoate) 50 mg/mL, net price 1-mL amp = £3.82; 100 mg/mL, 1-mL amp = £5.06
Excipients include sesame oil

HALOPERIDOL

Indications maintenance in schizophrenia and other psychoses
Cautions see Haloperidol (section 4.2.1) and notes above
Contra-indications see Haloperidol (section 4.2.1) and notes above
Hepatic impairment see section 4.2.1
Renal impairment see section 4.2.1
Pregnancy see section 4.2.1
Breast-feeding see section 4.2.1
Side-effects see Haloperidol (section 4.2.1) and notes above

Dose
- By deep intramuscular injection into the gluteal muscle, initially 50 mg every 4 weeks, if necessary increasing by 50-mg increments to 300 mg every 4 weeks; higher doses may be needed in some patients; ELDERLY, initially 12.5–25 mg every 4 weeks; CHILD not recommended

Note if 2-weekly administration preferred, doses should be halved

Haldol Decanoate® (Janssen-Cilag) injection (oily), haloperidol (as decanoate) 50 mg/mL, net price 1-mL amp = £3.82; 100 mg/mL, 1-mL amp = £5.06
Excipients include sesame oil

OLANZAPINE EMBONATE

(olanzapine Pamoate)

Indications maintenance in schizophrenia in patients tolerant to olanzapine by mouth
Cautions see under Olanzapine (section 4.2.1) and notes above; observe patient for at least 3 hours after injection
Contra-indications see under Olanzapine (section 4.2.1) and notes above
Hepatic impairment initially 150 mg every 4 weeks; increase with caution in moderate impairment
Renal impairment initially 150 mg every 4 weeks
Pregnancy see under Olanzapine (section 4.2.1)
Breast-feeding see under Olanzapine (section 4.2.1)
Side-effects see under Olanzapine (section 4.2.1) and notes above; post-injection reactions have been reported leading to signs and symptoms of overdose

Dose
- By deep intramuscular injection into the gluteal muscle, ADULT 18–75 years, patients taking oral olanzapine 10 mg daily, initially 210 mg every 2 weeks or 405 mg every 4 weeks, then maintenance dose after 2 months treatment, 150 mg every 2 weeks or 300 mg every 4 weeks; patients taking oral olanzapine 15 mg daily, initially 300 mg every 2 weeks, then maintenance dose after 2 months treatment, 210 mg every 2 weeks or 405 mg every 4 weeks; patients taking oral olanzapine 20 mg daily, initially 300 mg every 2 weeks, then maintenance dose after 2 months treatment 300 mg every 2 weeks; dose adjusted according to response; max. 300 mg every 2 weeks

Note If supplementation with oral olanzapine required, consult product literature
ZypAdhera® (Lilly) ▼ (BNF)
Injection, powder for reconstitution, olanzapine embonate 210-mg vial, net price = £142.76, 300-mg vial = £222.64, 405-mg vial = £285.52 (all with diluent)

PIPOTIAZINE PALMITATE
(Pipotiazine Palmitate)

**Indications** maintenance in schizophrenia and other psychoses
**Cautions** see Risperidone (section 4.2.1) and notes above; also thyrotoxicosis; hypothyroidism
**Contra-indications** see section 4.2.1 and notes above
**Hepatic impairment** see section 4.2.1
**Renal impairment** see section 4.2.1
**Pregnancy** see section 4.2.1
**Breast-feeding** avoid unless essential
**Side-effects** see section 4.2.1 and notes above; respiratory depression also reported

**Dose**
- By deep intramuscular injection into the gluteal muscle, test dose 25 mg, then a further 25–50 mg after 4–7 days, then adjusted according to response at intervals of 4 weeks; usual maintenance range 50–100 mg (max. 200 mg) every 4 weeks; ELDERLY initially 5–10 mg; CHILD not recommended

Pipotril Depot® (Sanofi-Aventis) ▼ (BNF)
Injection (oily), pipotiazine palmitate 50 mg/mL, net price 1-mL amp = £16.29; 2-mL amp = £26.65

**RISPERIDONE**

**Indications** schizophrenia and other psychoses in patients tolerant to risperidone by mouth
**Cautions** see Risperidone (section 4.2.1) and notes above
**Hepatic impairment** if an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks
**Renal impairment** see Risperidone (section 4.2.1)
**Pregnancy** see Risperidone (section 4.2.1)
**Breast-feeding** see Risperidone (section 4.2.1)
**Side-effects** see Risperidone (section 4.2.1); also hypertension; depression, paraesthesia; less commonly apathy, weight loss, injection-site reactions, and pruritus
**Dose**
- By deep intramuscular injection into the deltoid or gluteal muscle, patients taking oral risperidone up to 4 mg daily, initially 25 mg every 2 weeks; patients taking oral risperidone over 4 mg daily, initially 37.5 mg every 2 weeks; dose adjusted at intervals of at least 4 weeks in steps of 12.5 mg to max. 50 mg every 2 weeks; CHILD under 18 years not recommended

Note During initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

Risperdal Consta® (Janssen-Cilag) ▼ (BNF)
Injection, powder for reconstitution, risperidone 25-mg vial, net price = £79.69; 37.5-mg vial = £111.32; 50-mg vial = £142.76 (all with diluent)

4.2.3 Antimanic drugs

**ZUCLOPENTHIXOL DECANOATE**

**Indications** maintenance in schizophrenia and paranoid psychoses
**Cautions** see section 4.2.1 and notes above; QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval); avoid in acute porphyria (section 9.8.2)
**Contra-indications** see section 4.2.1 and notes above
**Hepatic impairment** see section 4.2.1
**Renal impairment** see section 4.2.1
**Pregnancy** see section 4.2.1
**Breast-feeding** see section 4.2.1
**Side-effects** see section 4.2.1 and notes above

**Dose**
- By deep intramuscular injection into the upper outer buttock or lateral thigh, test dose 100 mg, followed after at least 7 days by 200–500 mg or more, repeated at intervals of 1–4 weeks, adjusted according to response; max. 600 mg weekly; ELDERLY quarter to half usual starting dose; CHILD not recommended

Clopixol® (Lundbeck) ▼ (BNF)
Injection (oily), zuclopenthixol decanoate 200 mg/mL, net price 1-mL amp = £1.99

Clopixol Conc.® (Lundbeck) ▼ (BNF)
Injection (oily), zuclopenthixol decanoate 500 mg/mL, net price 1-mL amp = £3.65

4.2.3 Antimanic drugs

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug (section 4.3) may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

Benzodiazepines

Use of benzodiazepines (such as lorazepam) (section 4.1) may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

Antipsychotic drugs

Antipsychotic drugs (normally olanzapine, quetiapine, or risperidone) (section 4.2.1) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concurrently with lithium or valproate in the initial treatment of severe acute mania.

Olanzapine can be used for the long-term management of bipolar disorder [unlicensed use] either as monotherapy, or in combination with lithium or valproate if the patient has frequent relapses or continuing functional impairment.
When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antipsychotic drugs; if the patient is not continuing with other antipsychotic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.

High doses of haloperidol or flupentixol may be hazardous when used with lithium; irreversible toxic encephalopathy has been reported.

**Carbamazepine**

Carbamazepine (section 4.8.1) may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

When stopping treatment with carbamazepine, reduce the dose gradually over a period of at least 4 weeks.

**Valproate**

Valproic acid (as the semismsodium salt) is licensed for the treatment of manic episodes associated with bipolar disorder. Sodium valproate (section 4.8.1) is unlicensed for the treatment of bipolar disorder.

Valproate is also used for the prophylaxis of bipolar disorder [unlicensed use]; however, it should not normally be prescribed for women of child-bearing potential. In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or olanzapine, or adding lithium or olanzapine to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine, or risperidone.

If treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

**Lithium**

Lithium salts are used in the prophylaxis and treatment of mania, in the prophylaxis of bipolar disorder (manic-depressive disorder), as concomitant therapy with anti-depressant medication in patients who have had an incomplete response to treatment for acute depression in bipolar disorder, and in the prophylaxis of recurrent depression (unipolar illness or unipolar depression). Lithium is also used as an augmenting agent in patients with treatment-resistant depression (section 4.3).

In acute mania, lithium should only be used in patients who have responded to lithium before and whose symptoms are not severe.

The decision to give prophylactic lithium usually requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. Olanzapine or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

Long-term use of lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with monitoring of thyroid function every 6 months [more often if there is evidence of deterioration]. Renal function should be monitored at baseline and every 6 months thereafter [more often if there is evidence of deterioration or if the patient has other risk factors, such as starting ACE inhibitors, NSAIDs, or diuretics]. The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.

**Serum concentrations**

Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available. Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients). A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient. Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until levels are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient’s sodium or fluid intake.

Overdosage, usually with serum-lithium concentration of over 1.5 mmol/litre, may be fatal and toxic effects...
include tremor, ataxia, dysarthria, nystagmus, renal impairment, and convulsions. If these potentially hazardous signs occur, treatment should be stopped, serum-lithium concentrations redetermined, and steps taken to reverse lithium toxicity. In mild cases withdrawal of lithium and administration of sodium salts and fluid will reverse the toxicity. A serum-lithium concentration in excess of 2 mmol/litre requires urgent treatment as described under Emergency Treatment of Poisoning, p. 38.

**Interactions** Lithium toxicity is made worse by sodium depletion, therefore concurrent use of diuretics (particularly thiazides) is hazardous and should be avoided. For other interactions with lithium, see Appendix 1 (lithium).

**Withdrawal** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be stopped or is to be discontinued abruptly, consider withdrawal or rebound psychosis, abrupt discontinuation of therapy to an atypical antipsychotic or valproate.

While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be stopped or is to be discontinued abruptly, consider

**Pregnancy** Avoid if possible in the first trimester (risk of teratogenicity, including cardiac abnormalities); close monitoring of serum-lithium concentration advised (risk of toxicity in neonate)

**Breast-feeding** Present in milk and risk of toxicity in infant—avoid

**Side-effects** Gastro-intestinal disturbances, fine tremor, renal impairment (particularly impaired urinary concentration and polyuria), polydipsia, leucocytosis; also weight gain and oedema (may respond to dose reduction); hyperparathyroidism, hyperthyroidism, hyperglycaemia, hypermagnesaemia, and hypercalcaemia reported; signs of intoxication are blurred vision, increasing gastro-intestinal disturbances (anorexia, vomiting, diarrhoea), muscle weakness, increased CNS disturbances (mild drowsiness and slurred speech increasing to giddiness with ataxia, coarse tremor, lack of co-ordination, dysarthria), and require withdrawal of treatment; with severe overdose (serum-lithium concentration above 2 mmol/litre) hyperreflexia and hyperextension of limbs, convulsions, toxic psychoses, syncope, renal failure, circulatory failure, coma, and occasionally, death; goitre, raised antidiuretic hormone concentration, hypothyroidism, hypokalaemia, ECG changes, and kidney changes may also occur; see also Emergency Treatment of Poisoning, p. 38

**Dose**

- See under preparations below, adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter; doses are initially divided throughout the day; but once daily administration is preferred when serum-lithium concentration stabilised

**Note** Preparations vary widely in bioavailability, changing the preparation requires the same precautions as initiation of treatment

- Camcolit® (Norgine)
  - **Camcolit 250® tablets**; f/c, scored, lithium carbonate 250 mg (Li⁺ 6.8 mmol), net price 100-tab pack = £3.09. Label: 10, lithium card, counselling, see above
  - **Camcolit 400® tablets**; m/r, f/c, scored, lithium carbonate 400 mg (Li⁺ 10.8 mmol), net price 100-tab pack = £4.13. Label: 10, lithium card, 25, counselling, see above

- **Dose** (see Dose above for advice on bioavailability and serum monitoring)
  - **ADULT** and **CHILD** over 12 years, treatment, initially 1–1.5 g daily; prophylaxis, initially 300–400 mg daily
  - **Note** Camcolit 400® also available as Lithoson® (TEVA UK)

- **Liskonum®** (GSK)
  - **Tablets**; m/r, f/c, scored, lithium carbonate 450 mg (Li⁺ 12.2 mmol), net price 60-tab pack = £2.88. Label: 10, lithium card, 25, counselling, see above
  - **Dose** (see Dose above for advice on bioavailability and serum monitoring)

- **Priadel®** (Sanofi-Aventis)
  - **Tablets**; m/r, both scored, lithium carbonate 200 mg (Li⁺ 5.4 mmol), net price 100-tab pack= £2.30; 400 mg (Li⁺ 10.8 mmol), 100-tab pack = £3.35. Label: 10, lithium card, 25, counselling, see above
  - **Dose** (see Dose above for advice on bioavailability and serum monitoring)

- **Liquid**; see under Lithium Carbonate below

**Lithium treatment packs**

A lithium treatment pack may be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M.

**4.2.3 Antimanic drugs 231**

Central nervous system
Central nervous system

4.3 Antidepressant drugs

232

**LITHIUM CITRATE**

**Indications** see under Lithium Carbonate and notes above

**Cautions** see under Lithium Carbonate and notes above

**Counselling** Patients should maintain an adequate fluid intake and should avoid dietary changes which might reduce or increase sodium intake; lithium treatment cards are available from pharmacies (see above).

**Renal impairment** see Lithium Carbonate

**Pregnancy** see Lithium Carbonate

**Breast-feeding** see Lithium Carbonate

**Side-effects** see under Lithium Carbonate and notes above

**Dose**

- See under preparations below, adjusted to achieve serum-lithium concentration of 0.4–1 mmol/litre as described under Lithium Carbonate

**Note** Preparations vary widely in bioavailability, changing the preparation requires the same precautions as initiation of treatment

**Li-Liquid® (Rosemont)**

**Oral solution**. Lithium citrate 509 mg/5 mL (Li⁺ 5.4 mmol/5 mL), yellow, net price 150-mL pack = £5.79; 1.018 g/5 mL (Li⁺ 10.8 mmol/5 mL), orange, 150-mL pack = £11.58. Label: 10, lithium card, counselling, see above

**Dose** (see Dose above for advice on bioavailability and serum monitoring):

- Treatment and prophylaxis, initially 1.018–3.054 g daily in 2 divided doses (elderly or patients less than 50 kg, initially 509 mg twice daily). CHILD: not recommended

**Note** 5-mL dose of 509 mg/5 mL oral solution is equivalent to 200 mg lithium carbonate

**Pridad® (Sanofi-Aventis)**

**Tablets**, see under Lithium Carbonate

**Liquid**, sugar-free, lithium citrate 520 mg/5 mL (approx. Li⁺ 5.4 mmol/5 mL), net price 150-mL pack = £5.61. Label: 10, lithium card, counselling, see above

**Dose** (see Dose above for advice on bioavailability and serum monitoring):

- Treatment and prophylaxis, initially 1.04–3.12 g daily in 2 divided doses (elderly or patients less than 50 kg, 520 mg twice daily). CHILD: not recommended

**Note** 5-mL dose is equivalent to 204 mg lithium carbonate

**Choice** The major classes of antidepressant drugs include the tricyclic and related antidepressants (section 4.3.1), the selective serotonin re-uptake inhibitors (SSRIs) (section 4.3.3), and the monoamine oxidase inhibitors (MAOIs) (section 4.3.2). A number of antidepressant drugs cannot be accommodated easily into this classification; these are included in section 4.3.4.

There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient's requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation (see p. 233).

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdosage is also a problem. See section 4.3.1 for more details.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists. Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics (section 4.1.2) or antipsychotic drugs (section 4.2.1) should therefore be used with caution in depression but they are useful adjuncts in agitated patients. Augmenting antidepressants with antipsychotics under specialist supervision may also be necessary in patients who have depression with psychotic symptoms.

See section 4.2.3 for notes on the management of bipolar disorder.

St John's wort (Hypericum perforatum) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John's wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified (see Appendix 1, St John's wort). Furthermore, the amount of active ingredient varies between different preparations of St John's wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John's wort, concentrations of interacting drugs may increase, leading to toxicity.
Electroconvulsive therapy may be initiated in severe depression with special experience of these combinations. Such adjunctive treatment should be initiated only by prescribers with appropriate experience in the use of these agents. Aripiprazole [unlicensed], olanzapine [unlicensed], quetiapine, and other antidepressants of a different class, or use of other tricyclic antidepressants should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal behaviour and antidepressant therapy

The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Management

Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond).

Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

Failure to respond

Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine. Other second-line choices include nefazodone, moclobemide, and reboxetine. Other tricyclic antidepressants and venlafaxine should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium (section 4.2.3), aripiprazole [unlicensed], olanzapine [unlicensed], quetiapine, or risperidone [unlicensed] (section 4.2.1)), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Withdrawal

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. Drugs with a shorter half-life, such as paroxetine (p. 241) and venlafaxine (p. 244), are associated with a higher risk of withdrawal symptoms. The risk of withdrawal symptoms is also increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). See also section 4.3.1, section 4.3.2, and section 4.3.3.

Anxiety disorders and obsessive-compulsive disorder

Management of acute anxiety generally involves the use of a benzodiazepine or buspirone (section 4.1.2). For chronic anxiety (of longer than 4 weeks’ duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Generalised anxiety disorder, a form of chronic anxiety, is treated with an SSRI such as escitalopram or paroxetine; pregabalin and venlafaxine are also licensed for the treatment of generalised anxiety disorder.

Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder, and phobic states such as social anxiety disorder are treated with SSRIs. Clomipramine or imipramine can be used second-line in panic disorder [unlicensed]; clomipramine can also be used second-line for obsessive-compulsive disorder. Moclobemide is licensed for the treatment of social anxiety disorder.

Cautions

Tricyclic and related antidepressant drugs should be used with caution in patients with cardiovascular disease (see also Contra-indications, below); because of the risk of arrhythmias, patients with comorbid conditions such as hyperthyroidism and phaeochromocytoma should be treated with care. Care is also needed in patients with epilepsy and diabetes.

Tricyclic antidepressant drugs have antimuscarinic activity, and therefore caution is needed in patients with prostatic hypertrophy, chronic constipation, increased intra-ocular pressure, urinary retention, or those with a susceptibility to angle-closure glaucoma. Tricyclic and related antidepressant drugs should be used with caution in patients with a significant risk of suicide, or a history of psychosis or bipolar disorder, because antidepressant therapy may aggravate these conditions; treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

Overdosage

Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose. In particular, overdosage with dosulepin and amitriptyline is associated with a relatively high rate of fatality. Lofepramine is associated with the lowest risk of fatality in overdose, in comparison with other tricyclic antidepressant drugs. For advice on overdose see Emergency Treatment of Poisoning, p. 37.
**Withdrawing** Amitriptyline and imipramine are the tricyclic antidepressants most commonly associated with withdrawal symptoms. These symptoms include influenza-like symptoms (chills, myalgia, sweating, headache, nausea), insomnia, vivid dreams, and may occasionally include movement disorders, mania, and cardiac arrhythmia. If possible tricyclic and related antidepressants should be withdrawn slowly (see also section 4.3).

**Interactions** A tricyclic or related antidepressant (or an SSRI or related antidepressant) should not be started until 2 weeks after stopping an MAOI (3 weeks if starting clomipramine or imipramine). Conversely, an MAOI should not be started until at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped. For guidance relating to the reversible monoamine oxidase inhibitor, moclobemide, see p. 239. For other tricyclic antidepressant interactions, see Appendix 1 (antidepressants, tricyclic and related antidepressants, tricyclic (related)).

**Driving** Drowsiness may affect the performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

**Contra-indications** Tricyclic and related antidepressants are contra-indicated in the immediate recovery period after myocardial infarction, in arrhythmias (particularly heart block), and in the manic phase of bipolar disorder. Avoid treatment with tricyclic antidepressant drugs in acute porphyria (section 9.8.2).

**Hepatic impairment** Tricyclic antidepressants are preferable to MAOIs in hepatic impairment but sedative effects are increased. They should be avoided in severe liver disease.

**Breast-feeding** The amount of tricyclic antidepressants (including related drugs such as mianserin and trazodone) secreted into breast milk is too small to be harmful (but see Doxepin, p. 236).

**Side-effects** Arrhythmias and heart block occasionally follow the use of tricyclic antidepressants, particularly amitriptyline, and may be a factor in the sudden death of patients with cardiac disease; other cardiovascular side-effects include postural hypotension, tachycardia, and ECG changes. The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdose.

Central nervous system side-effects are common, particularly in the elderly, and include anxiety, dizziness, agitation, confusion, sleep disturbances, irritability, and paraesthesia; drowsiness is associated with some of the tricyclic antidepressants (see under Choice, below). Convulsions, hallucinations, delusions, mania, and hypomania may occur (see also under Cautions, above), and, rarely, extrapyramidal symptoms including tremor and dysarthria. Antimuscarinic side-effects include dry mouth, blurred vision (very rarely precipitation of angle-closure glaucoma), constipation (rarely) leading to paralytic ileus, particularly in the elderly, and urinary retention. Tricyclic-related antidepressant drugs have a lower incidence of antimuscarinic side-effects than older tricyclics.

Endocrine effects include breast enlargement, galactorrhoea, and gynaecomastia. Sexual dysfunction may occur. Changes in blood sugar, increased appetite, and weight gain can accompany treatment with tricyclic antidepressant drugs, but anorexia and weight loss are also seen. Hepatic and haematological reactions may occur and have been particularly associated with mianserin. Another side-effect to which the elderly are particularly susceptible is hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 233). Other class side-effects include nausea, vomiting, taste disturbance, tinnitus, rash, urticaria, pruritus, photosensitivity, alopecia, and sweating.

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Neuroleptic malignant syndrome (section 4.2.1) may, very rarely, occur in the course of antidepressant drug treatment.

Suicidal behaviour has been linked with antidepressants (see p. 233).

**Dosage** About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the elderly (see under Side-effects, below).

In most patients the long half-life of tricyclic antidepressant drugs allows once-daily administration, usually at night; the use of modified-release preparations is therefore unnecessary.

**Choice** Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine is more selective for serotoninergic transmission, and imipramine is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with sedative properties include amitriptyline, clomipramine, doxepin, doxepin, mianserin, trazodone, and trimipramine. Those with less sedative properties include imipramine, lofepramine, and nor-triptyline.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdose, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdose but is infrequently associated with hepatic toxicity. Imipramine is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants.

* Amitriptyline and doxepin are effective but they are particularly dangerous in overdose (see Overdose, above) and are not recommended for the treatment of depression; doxepin should only be prescribed by specialists.

**Children and adolescents** Studies have shown that tricyclic antidepressants are not effective for treating depression in children; see also Depressive Illness in Children and Adolescents, p. 239.
Tricyclic antidepressants

Amitriptyline Hydrochloride

**Indications** depressive illness (but not recommended, see notes above); nocturnal enuresis in children (section 7.4.2); neuropathic pain (unlicensed) (section 4.7.3); migraine prophylaxis (unlicensed) (section 7.4.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** see notes above

**Side-effects** see notes above; also abdominal pain, diarrhoea, hypertension, flushing, restlessness, fatigue, mydriasis, and increased intra-ocular pressure; high rate of fatality in overdose—see notes above

**Dose**

- **Depression** (but not recommended, see notes above), ADULT and CHILD over 14 years, initially 75 mg (elderly and adolescents 30–75 mg) daily in divided doses or as a single dose at bedtime increased gradually as necessary to 150–200 mg
- **Nocturnal enuresis**, CHILD 7–11 years 10–20 mg at night, 11–16 years 25–50 mg at night; max. period of treatment (including gradual withdrawal) 3 months—full physical examination, including ECG, before further course
- **Neuropathic pain** (unlicensed indication), initially 10 mg daily at night, gradually increased if necessary to 75 mg daily; higher doses under specialist supervision
- **Migraine prophylaxis** (unlicensed indication), initially 10 mg at night, increased if necessary to maintenance of 50–75 mg at night; max. 150 mg at night

**Amitriptyline** *(Non-proprietary)*

**Tablets**, coated, amitriptyline hydrochloride 10 mg, net price 28-tab pack = £0.90; 25 mg, 28-tab pack = £0.99; 50 mg, 28-tab pack = £1.00. Label: 2

**Oral solution**, amitriptyline hydrochloride 25 mg/5 mL, net price 150 mL = £15.47; 50 mg/5 mL, 150 mL = £16.82. Label: 2

**Compound preparations**

**Triptafen** *(Goldshield)*

**Tablets**, pink, s/c, amitriptyline hydrochloride 25 mg, perphenazine 2 mg, net price 100-tab pack = £25.49. Label: 2

Dose depression with anxiety, ADULT and CHILD over 14 years, 1 tablet 3 times daily; an additional tablet may be taken at bedtime when required

Clopipramine Hydrochloride

**Indications** depressive illness, phobic and obsessional states; adjunctive treatment of cataplexy associated with narcolepsy

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Pregnancy** neonatal withdrawal symptoms reported if used during third trimester

**Breast-feeding** see notes above

**Side-effects** see notes above; also abdominal pain, diarrhoea, hypertension, flushing, restlessness, fatigue, aggression, impaired memory, muscle weakness, muscle hypertonia, myoclonus, mydriasis, and yawning; very rarely allergic alveolitis

**Dose**

- **Depressive illness**, ADULT over 18 years, initially 10 mg daily, increased gradually as necessary to 30–150 mg daily in divided doses or as a single dose at bedtime; max. 250 mg daily; ELDERLY initially 10 mg daily increased carefully over approx. 10 days to 30–75 mg daily
- **Phobic and obsessional states**, ADULT over 18 years, initially 25 mg daily (ELDERLY 10 mg daily) increased over 2 weeks to 100–150 mg daily; max. 250 mg daily
- **Adjunctive treatment of cataplexy associated with narcolepsy**, ADULT over 18 years, initially 10 mg daily, gradually increased until satisfactory response (range 10–75 mg daily)

**Clomipramine** *(Non-proprietary)*

**Capsules**, clomipramine hydrochloride 10 mg, net price 28-cap pack = £1.71; 25 mg, 28-cap pack = £2.01; 50 mg, 28-cap pack = £2.75. Label: 2

**Anafanril** *(Novartis)*

**Capsules**, clomipramine hydrochloride 10 mg (yellow/caramel), net price 84-cap pack = £8.35; 50 mg (grey/caramel), 56-cap pack = £8.06. Label: 2

**Modified release**

**Anafanril SR** *(Novartis)*

**Tablets**, m/r, grey-red, f/c, clomipramine hydrochloride 75 mg, net price 28-tab pack = £8.83. Label: 2, 25

**Dose** see above; to be taken once daily

**Dosulepin Hydrochloride** *(Dothiepin hydrochloride)*

**Indications** depressive illness, particularly where sedation is required

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** see notes above

**Side-effects** see notes above; also increased intra-ocular pressure; high rate of fatality in overdose—see notes above

**Dose**

- Initially 75 mg (ELDERLY 50–75 mg) daily in divided doses or as a single dose at bedtime, increased gradually as necessary to 150 mg daily (ELDERLY 75 mg may be sufficient); up to 225 mg daily in some circumstances (e.g. hospital use); CHILD not recommended

**Dosulepin** *(Non-proprietary)*

**Capsules**, dosulepin hydrochloride 25 mg, net price 28-cap pack = £1.11. Label: 2

**Tablets**, dosulepin hydrochloride 75 mg, net price 28-tab pack = £1.34. Label: 2

**Prothiaden** *(Teofarma)*

**Capsules**, red/red-brown, dosulepin hydrochloride 25 mg, net price 28-cap pack = £1.70. Label: 2

**Tablets**, red, s/c, dosulepin hydrochloride 75 mg, net price 28-tab pack = £2.97. Label: 2
4 Central nervous system

**DOXEPIN**

**Indications** depressive illness, particularly where sedation is required; pruritus in eczema (section 13.3)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution

**Pregnancy** neonatal withdrawal symptoms and respiratory depression reported if used during third trimester

**Breast-feeding** see notes above

**Side-effects** see notes above; accumulation of metabolite may cause sedation and respiratory depression in neonate

**Dose**
- **ADULT** and **CHILD** over 12 years, initially 75 mg daily in divided doses or as a single dose at bedtime, adjusted according to response; usual maintenance 30–300 mg daily (doses above 100 mg given in 3 divided doses); **ELDERLY** initially 10–50 mg daily adjusted according to response (usual maintenance 50–50 mg daily)

**Sinapin** (Marlborough) (TM)

**Capsules**, doxepin (as hydrochloride) 25 mg, net price 28-cap pack = £3.77; 50 mg, 28-cap pack = £5.71. Label: 2

**LOFEPRAMINE**

**Indications** depressive illness

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** see notes above

**Side-effects** see notes above; also oedema and hepatic disorders reported

**Dose**
- 140–210 mg daily in divided doses; **ELDERLY** may respond to lower doses; **CHILD** under 18 years not recommended

**Lofepramine** (Non-proprietary) (TM)

**Tablets**, lofepramine 70 mg (as hydrochloride), net price 56-tab pack = £5.69. Label: 2

**Brands include** Feprapax®

**Oral suspension**, lofepramine 70 mg/5 mL (as hydrochloride), net price 150 mL = £22.22. Label: 2

**Brands include** Lomont® (sugar-free)

**NORTRIPTYLINE**

**Indications** depressive illness; nocturnal enuresis in children (section 7.4.2); neuropathic pain [unlicensed] (section 4.7.3)

**Cautions** see notes above; manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** see notes above

**Side-effects** see notes above; also abdominal pain, stomatitis, diarrhoea, flushing, and oedema

**Dose**
- Depression, low dose initially increased as necessary to 75–100 mg daily in divided doses or as a single dose at bedtime (max. 150 mg daily); **ADOLESCENT** and **ELDERLY** 30–50 mg daily in divided doses; **CHILD** not recommended for depression
- Nocturnal enuresis, **CHILD** 7 years 10 mg, 8–11 years 10–20 mg, over 11 years 25–35 mg, 30 minutes before bedtime; max. period of treatment (including gradual withdrawal) 3 months—full physical examination and ECG before further course
- Neuropathic pain [unlicensed], initially 10 mg daily at night, gradually increased if necessary to 75 mg daily; higher doses under specialist supervision

**Allegron** (King) (TM)

**Tablets**, nortriptyline (as hydrochloride) 10 mg, net price 100-tab pack = £12.06; 25 mg (orange, scored), 100-tab pack = £24.02. Label: 2

**IMIPRAMINE HYDROCHLORIDE**

**Indications** depressive illness; nocturnal enuresis in children (section 7.4.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution in severe impairment

**Pregnancy** use with caution in severe impairment

**Breast-feeding** see notes above

**Side-effects** see notes above; also abdominal pain, stomatitis, diarrhoea, hypertension, oedema, flushing, restlessness, fatigue, and mydriasis

**Dose**
- Depression, initial dose (max. 150 mg daily); **ADOLESCENT** and **ELDERLY** 30–50 mg daily in divided doses; **CHILD** not recommended for depression
- Nocturnal enuresis, **CHILD** 7 years 10 mg, 8–11 years 10–20 mg, over 11 years 25–35 mg, 30 minutes before bedtime; max. period of treatment (including gradual withdrawal) 3 months—full physical examination and ECG before further course
- Neuropathic pain [unlicensed], initially 10 mg daily at night, gradually increased if necessary to 75 mg daily; higher doses under specialist supervision

**Imipramine** (Non-proprietary) (TM)

**Tablets**, coated, imipramine hydrochloride 10 mg, net price 28-tab pack = £1.30; 25 mg, 28-tab pack = £1.24. Label: 2

**Oral solution**, imipramine hydrochloride 25 mg/5 mL, net price 150-mL = £20.00. Label: 2

**TRIMIPRAMINE**

**Indications** depressive illness, particularly where sedation required

**Cautions** see notes above
Monamine-oxidase inhibitors (MAOIs)

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa. Transylcypromine is the most hazardous of the MAOIs because of its stimulant action. The drugs of choice are phenelzine or isocarboxazid which are less stimulant and therefore safer.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

Withdrawal MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly (see also section 4.3).

Hepatic impairment MAOIs may cause idiosyncratic hepatotoxicity if used in patients with hepatic impairment. See also individual monographs.

Pregnancy There is an increased risk of neonatal malformations when phenelzine, isocarboxazid, or tranylcypromine is used during pregnancy. The safety of moclobemide in pregnancy has not been established. Manufacturers advise avoid use unless there are compelling reasons.
4.3.2 Monoamine-oxidase inhibitors

**Interactions** MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters. The metabolism of some amine drugs such as indirect-acting sympathomimetics (present in many cough and decongestant preparations, section 3.10) is also inhibited and their pressor action may be potentiated; the pressor effect of tyramine (in some foods, such as mature cheese, pickled herring, broad bean pods, and Bovril, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract) may also be dangerously potentiated. These interactions may cause a dangerous rise in blood pressure. An early warning symptom may be a throbbing headache. Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or ‘going off’. This is especially important with meat, fish, poultry or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.

**Other antidepressants** should not be started for 2 weeks after treatment with MAOIs has been stopped (3 weeks if starting clomipramine or imipramine). Some psychiatrists use selective tricyclics in conjunction with MAOIs but this is hazardous, indeed potentially lethal, except in experienced hands and there is no evidence that the combination is more effective than when either constituent is used alone. The combination of tranylcypromine with clomipramine is particularly dangerous.

Conversely, an MAOI should not be started until at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped.

In addition, an MAOI should not be started for at least 2 weeks after a previous MAOI has been stopped (then started at a reduced dose).

For other interactions with MAOIs including those with opioid analgesics (notably pethidine), see Appendix 1 (MAOIs). For guidance on interactions relating to the reversible monoamine oxidase inhibitor, moclobemide, see p. 239; for guidance on interactions relating to SSRIs, see p. 240.

**PHENELZINE**

**Indications** depressive illness

**Cautions** diabetes mellitus, cardiovascular disease, epilepsy, blood disorders, concurrent electroconvulsive therapy, elderly (great caution); monitor blood pressure (risk of postural hypotension and hypertensive responses—discontinue if palpitations or frequent headaches); if possible avoid abrupt withdrawal; severe hypertensive reactions to certain drugs and foods; avoid in agitated patients; acute porphyria (section 9.8.2); surgery (section 15.1); interactions: Appendix 1 (MAOIs).

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving).

**Contra-indications** cerebrovascular disease, phaeochromocytoma; not indicated in manic phase

**Hepatic impairment** avoid in hepatic impairment; see also notes above

**Renal impairment** use with caution

**Pregnancy** see notes above

**Breast-feeding** avoid

**Side-effects** commonly postural hypotension (especially in elderly) and dizziness; less common side-effects include drowsiness, insomnia, headache, weakness and fatigue, dry mouth, constipation and other gastro-intestinal disturbances, oedema, myoclonic movement, hyperreflexia, elevated liver enzymes; agitation and tremors, nervousness, euphoria, arrhythmias, blurred vision, nystagmus, difficulty in micturition, sweating, convulsions, rashes, purpura, leucopenia, sexual disturbances, and weight gain with inappropriate appetite may also occur; psychotic episodes with hypomanic behaviour, confusion, and hallucinations may be induced in susceptible persons; suicidal behaviour (see p. 233); jaundice has been reported and, on rare occasions, fatal progressive hepatocellular necrosis; paraesthesia, peripheral neuritis, peripheral neuropathy may be due to pyridoxine deficiency; hypotension (see Hypotension and Antidepressant Therapy, p. 233)

**Dose**

- Initially 30 mg daily in single or divided doses until improvement occurs (increased after 4 weeks if necessary to max. 60 mg daily for 4–6 weeks under close supervision), then reduced to usual maintenance dose 10–20 mg daily (but up to 40 mg daily may be required); Elderly 5–10 mg daily; Child not recommended

**Isocarboxazid** (Non-proprietary)

Tablets, pink, scored, isocarboxazid 10 mg, net price 100-tab pack = £18.75. Label: 3, 10, patient information leaflet

**TRANYLCYROMINE**

**Indications** depressive illness

**Cautions** see under Phenelzine

**Contra-indications** see under Phenelzine

**Hepatic impairment** avoid in hepatic impairment; see also notes above

**Dose**

- Initially 15 mg 3 times daily, increased if necessary to 4 times daily after 2 weeks (hospital patients, max. 30 mg 3 times daily), then reduced gradually to lowest possible maintenance dose (15 mg on alternate days may be adequate); Child not recommended

**Breast-feeding** present in milk in animal studies

**Side-effects** see under Phenelzine; insomnia; hypertensive crises with throbbing headache requiring discontinuation of treatment more frequent than with other MAOIs; liver damage less frequent than with phenelzine; blood dyscrasias also reported
4.3.3 Selective serotonin re-uptake inhibitors

**Moclobemide**

**Indications**
- Depressive illness; social anxiety disorder

**Cautions**
- Avoid in agitation or excited patients (or give with sedative for up to 2–3 weeks), thyrotoxicosis, or for at least 4 weeks after an MAOI has been stopped.

**Contra-indications**
- Acute confusional states, phaeochromocytoma

**Hepatic impairment**
- Reduce dose in severe disease

**Breast-feeding**
- Amount too small to be harmful, but patient information leaflet advises against

**Side-effects**
- Sleep disturbances, dizziness, gastrointestinal disorders, headache, restlessness, agitation; paraesthesia, dry mouth, visual disturbances; oedema, skin reactions, confusional states reported; rarely raised liver enzymes, galactorrhoea, hyperprolactinaemia (see Hypotenaemia and Antidepressant Therapy, p. 233)

**Dose**
- Depression, usually 300 mg daily divided doses after food, adjusted according to response; usual range 150–600 mg daily; **CHILD not recommended**
- Social anxiety disorder, initially 300 mg daily increased on fourth day to 600 mg daily in 2 divided doses, continued for 8–12 weeks to assess efficacy; **CHILD not recommended**

- **Moclobemide (Non-proprietary)**
  - Tablets, moclobemide 150 mg, net price 30-tab pack = £3.76; 300 mg, 30-tab pack = £5.86. Label: 10, patient information leaflet, 21

**Citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, and sertraline**

- Are termed selective serotonin re-uptake inhibitors (SSRIs). For a general comment on the management of depression and on the comparison between tricyclic and related antidepressants and the SSRIs and related antidepressants, see section 4.3.

**Depressive illness in children and adolescents**

- The balance of risks and benefits for the treatment of depressive illness in children under 18 years is considered unfavourable for the SSRIs citalopram, escitalopram, paroxetine, and sertraline, and for mirtazapine and venlafaxine. Clinical trials have failed to show efficacy and have shown an increase in harmful outcomes. However, it is recognised that specialists may sometimes decide to use these drugs in response to individual clinical need; children and adolescents should be monitored carefully for suicidal behaviour, self-harm or hostility, particularly at the beginning of treatment.
- Only fluoxetine has been shown in clinical trials to be effective for treating depressive illness in children and adolescents. However, it is possible that, in common with the other SSRIs, it is associated with a small risk of self-harm and suicidal thoughts. Overall, the balance of risks and benefits for fluoxetine in the treatment of depressive illness in individuals under 18 years is considered favourable, but children and adolescents must be carefully monitored as above.

**Cautions**
- SSRIs should be used with caution in patients with epilepsy (avoid if poorly controlled, discontinue if convulsions develop), cardiac disease, diabetes mellitus, susceptibility to angle-closure glaucoma, a history of mania or bleeding disorders (especially gastro-intestinal bleeding), and if used with other drugs that increase the risk of bleeding. They should also be used with caution in those receiving concurrent electroconvulsive therapy (prolonged seizures reported with fluoxetine). SSRIs may also impair performance of skilled tasks (e.g. driving).

**Withdrawal**
- The risk of withdrawal reactions is higher with paroxetine (see also Withdrawal, section 4.3). Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most com-
mon features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpititation and visual disturbances can occur less commonly. The dose should be tapered over a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist.

**Interactions** An SSRI or related antidepressant should not be started until 2 weeks after stopping an MAOI. Conversely, an MAOI should not be started until at least a week after an SSRI or related antidepressant has been stopped (2 weeks in the case of sertraline, at least 5 weeks in the case of fluoxetine). For guidance relating to the reversible monoamine oxidase inhibitor, moclobemide, see above. For other SSRI antidepressant interactions, see Appendix 1 (antidepressants, SSRI).

**Contra-indications** SSRIs should not be used if the patient enters a manic phase.

**Pregnancy** Manufacturers advise that SSRIs should not be used if the patient enters a manic phase.

**Breast-feeding** present in milk—avoid

**Pregnancy** no information available for eGFR

**Renal impairment** indicated over a longer period; consider obtaining specialist advice if symptoms persist.

**Hepatic impairment** tapered over a few weeks to avoid these effects. For guidance relating to the reversible monoamine oxidase inhibitor, moclobemide, see above. For other SSRI antidepressant interactions, see Appendix 1 (antidepressants, SSRI).

**Contra-indications** SSRIs should not be used if the patient enters a manic phase.

**Cautions** see notes above

**Indications** see notes above; also hepatitis, palpititation, tachycardia, oedema, bradycardia, postural hypotension, coughing, yawning, confusion, impaired concentration, aggression, malaise, amnesia, migraine, paraesthesia, abnormal dreams, mydriasis, taste disturbance, increased salivation, rhinitis, tinnitus, polynya, micturition disorders, euphoria, pruritus; paradoxical increased anxiety during initial treatment of panic disorder (reduce dose)

**Dose**
- **By mouth as tablets**, depressive illness, 20 mg once daily increased if necessary in steps of 20 mg daily at intervals of 3–4 weeks; max. 60 mg daily **ELDERLY over 65 years, max. 40 mg daily**; CHILd under 18 years see **BNF for Children and Depressive Illness in Children and Adolescents**, p. 239
- **Panic disorder, ADULT over 18 years, initially 10 mg daily increased gradually if necessary in steps of 10 mg daily, usual dose 20–30 mg daily; max. 60 mg daily (ELDERLY over 65 years, max. 40 mg daily)
- **By mouth as oral drops**, depressive illness, 16 mg daily as a single dose increased if necessary in steps of 16 mg daily at intervals of 3–4 weeks; max. 48 mg daily **ELDERLY over 65 years, max. 32 mg daily**; CHILd under 18 years see **BNF for Children and Depressive Illness in Children and Adolescents**, p. 239
- **Panic disorder, ADULT over 18 years, initially 8 mg daily as a single dose increased gradually if necessary in steps of 8 mg, usual dose 16–24 mg daily; max. 48 mg daily (ELDERLY over 65 years, max. 32 mg daily)

**Citalopram (Non-proprietary) (BNF 61)**

**Tablets**, citalopram (as hydrobromide) 10 mg, net price 28-tab pack = £1.03; 20 mg, 28-tab pack = £1.30; 40 mg, 28-tab pack = £1.37. Counselling, driving

**Oral drops**, citalopram (as hydrochloride) 40 mg/mL, net price 15 mL = £17.92. Counselling, driving, administration

**Note 4 drops (8 mg) is equivalent in therapeutic effect to 10-mg tablet**

Mix with water, orange juice, or apple juice before taking

**Cipramil** (Lundbeck) (BNF 61)

**Tablets**, f/c, citalopram (as hydrobromide) 10 mg, net price 28-tab pack = £5.38; 20 mg (scored), 28-tab pack = £8.95; 40 mg, 28-tab pack = £15.12. Counselling, driving

**Oral drops**, sugar-free, citalopram (as hydrochloride) 40 mg/mL, net price 15 mL = £10.08. Counselling, driving, administration

**Expiants include alcohol.**

**Note 4 drops (8 mg) is equivalent in therapeutic effect to 10-mg tablet**

Mix with water, orange juice, or apple juice before taking

**ESCITALOPRAM**

Note: Escitalopram is the active enantiomer of citalopram

**Indications** see under Dose

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** initial dose 5 mg daily for 2 weeks, thereafter increased to 10 mg daily according to response; particular caution in severe impairment

**Renal impairment** caution if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** present in milk; avoid

**Side-effects** see notes above; also hepatitis, palpititation, tachycardia, oedema, bradycardia, postural hypotension, coughing, yawning, confusion, impaired concentration, aggression, malaise, amnesia, migraine, paraesthesia, abnormal dreams, mydriasis, taste disturbance, increased salivation, rhinitis, tinnitus, polynya, micturition disorders, euphoria, pruritus; paradoxical increased anxiety during initial treatment of panic disorder (reduce dose)

240 4.3.3 Selective serotonin re-uptake inhibitors

**CITALOPRAM**

**Indications** depressive illness, panic disorder

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** use doses at lower end of range

**Renal impairment** no information available for eGFR less than 20 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** present in milk—avoid
4.3.3 Selective serotonin re-uptake inhibitors

**Side-effects** see notes above; also sinusitis, yawning, fatigue, restlessness, abnormal dreams, paraesthesia; pyrexia; less commonly taste disturbance, bruxism, syncope, tachycardia, oedema, confusion, menstrual disturbances, epistaxis, mydriasis, tinnitus, pruritus, and alopecia; rarely Bradycardia, aggression, and depersonalisation; hepatitis, postural hypotension, QT interval prolongation, and thrombocytopenia also reported; paradoxical increased anxiety during initial treatment of panic disorder (reduce dose)

**Dose**
- **ADULT** over 18 years, depressive illness, generalised anxiety disorder, and obsessive-compulsive disorder, 10 mg once daily if necessary to max. 20 mg daily; **ELDERLY** initially half adult dose, lower maintenance dose may be sufficient; **CHILD** not recommended (see Depressive Illness in Children and Adolescents, p. 239)
- **ADULT** over 18 years, panic disorder, initially 5 mg once daily increased to 10 mg daily after 7 days; max. 20 mg daily; **ELDERLY** initially half adult dose, lower maintenance dose may be sufficient
- **ADULT** over 18 years, social anxiety disorder, initially 10 mg once daily adjusted after 2–4 weeks; usual dose 5–20 mg daily

**Cipralex** (Lundbeck) Tablets, f/c, escitalopram (as oxalate) 5 mg, net price 28-tab pack = £14.91; 20 mg (scored), 28-tab pack = £25.20. Counselling, driving

**Oral drops**—sugar-free, escitalopram (as oxalate) 10 mg/mL, net price 28 mL = £18.82; 20 mg/mL, 15 mL = £20.16. Counselling, driving, administration

**Note** Can be mixed with water, orange juice, or apple juice before taking

---

### FLUOXETINE MALEATE

**Indications** depressive illness, obsessive-compulsive disorder

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** reduce dose or increase dose interval

**Pregnancy** see notes above

**Breast-feeding** present in milk—avoid

**Side-effects** see notes above; also vasodilatation, postural hypotension, pharyngitis, dyspnoea, chills, taste disturbance, sleep disturbances, euphoria, confusion, yawning, impaired concentration, changes in blood sugar, alopecia, urinary frequency; rarely pulmonary inflammation and fibrosis; very rarely hepatotoxic, toxic epidermal necrolysis, and neuroleptic malignant syndrome-like event

**Dose**
- Depression, **ADULT** over 18 years, initially 50–100 mg daily in the evening, increased gradually if necessary to max. 300 mg daily (over 150 mg in divided doses); usual maintenance dose 100 mg daily
- Obsessive-compulsive disorder, initially 50 mg in the evening increased gradually if necessary after some weeks to max. 300 mg daily (over 150 mg in divided doses); usual maintenance dose 100–300 mg daily; **CHILD** over 8 years initially 25 mg daily increased if necessary in steps of 25 mg every 4–7 days to max. 200 mg daily (over 50 mg in 2 divided doses)

**Note** If no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

**Fluvoxamine** (Non-proprietary) Tablets, fluvoxamine maleate 50 mg, net price 30-tab pack = £10.81; 100 mg, 30-tab pack = £11.67. Counselling, driving

**Faverin** (Abbott Healthcare) Tablets, f/c, scored, fluvoxamine maleate 50 mg, net price 60-tab pack = £10.81; 100 mg, 30-tab pack = £11.67. Counselling, driving

---

### PAROXETINE

**Indications** major depression, obsessive-compulsive disorder, panic disorder, social anxiety disorder, post-traumatic stress disorder; generalised anxiety disorder

**Cautions** see notes above; also achlorhydria or high gastric pH (reduced absorption of oral suspension)

**Contra-indications** see notes above

**Hepatic impairment** reduce dose
242  4.3.4 Other antidepressant drugs

Renal impairment  reduce dose if eGFR less than 30 mL/minute/1.73 m²

Pregnancy  increased risk of congenital malformations, especially if used in the first trimester; see also notes above

Breast-feeding  present in milk but amount too small to be harmful

Side-effects  see notes above; also yawning; abnormal dreams; raised cholesterol; less commonly arrhythmias, confusion, urinary incontinence; rarely panic attacks and paradoxical increased anxiety during initial treatment of panic disorder (reduce dose), depersonalisation, and neuropsychiatric malignant syndrome-like event; rarely restless legs syndrome; very rarely peripheral oedema, acute glaucoma, hepatic disorders (e.g. hepatitis), and priapism; also reported tinnitus, extrapyramidal reactions (including orofacial dystonias) and withdrawal reactions (see notes above)

Dose
- Major depression, social anxiety disorder, post-traumatic stress disorder, generalised anxiety disorder, ADULT over 18 years, recommended dose 20 mg each morning (no evidence of greater efficacy at higher doses); max. 50 mg daily (ELDERLY 40 mg daily); CHILD under 18 years not recommended (see Depressive Illness In Children and Adolescents, p. 239)
- Obsessive-compulsive disorder, ADULT over 18 years, initially 20 mg each morning, increased gradually in steps of 10 mg to recommended dose of 40 mg daily (no evidence of greater efficacy at higher doses); max. 60 mg daily (ELDERLY 40 mg daily)
- Panic disorder, ADULT over 18 years, initially 10 mg each morning, increased gradually in steps of 10 mg to recommended dose of 40 mg daily (no evidence of greater efficacy at higher doses); max. 60 mg daily (ELDERLY 40 mg daily)

Paroxetine  (Non-proprietary)  (A)
- Tablets, paroxetine (as hydrochloride) 20 mg, net price 30-tab pack = £2.29; 30 mg, 30-tab pack = £3.17. Label: 21, counselling, driving

Sertraline  (Non-proprietary)  (BNF 61)
- Tablets, paroxetine (as hydrochloride) 10 mg, net price 28-tab pack = £1.15; 100 mg, 30-tab pack = £1.53. Counselling, driving
- Tablets, f/c, scored, paroxetine (as hydrochloride) 20 mg, net price 28-tab pack = £1.15; 100 mg, 28-tab pack = £1.53. Counselling, driving
- Oral suspension, orange, sugar-free, paroxetine (as hydrochloride) 10 mg/5 mL, net price 150 mL pack = £9.12. Label: 5, 21, counselling, driving

SERTRALINE

Indications  see under Dose

Cautions  see notes above

Contra-indications  see notes above

Hepatic impairment  reduce dose or increase dose interval in mild or moderate impairment; avoid in severe impairment

Renal impairment  use with caution

Pregnancy  see notes above

Breast-feeding  not known to be harmful but consider discontinuing breast-feeding

Side-effects  see notes above; pancreatitis, hepatitis, jaundice, liver failure, stomatitis, palpitation, hyperpyrexia, hyperglycaemia, tachycardia, postural hypotension, bronchospasm, amnesia, paraesthesia, aggression, hypoglycaemia, hypothyroidism, hyperprolactinaemia, urinary incontinence, menstrual irregularities, leucopenia, and tinnitus also reported

Dose
- Depressive illness, initially 50 mg daily, increased if necessary by increments of 50 mg at intervals of at least 1 week to max. 200 mg daily; usual maintenance dose 50 mg daily; CHILD under 18 years, see BNF for Children and Depressive Illness in Children and Adolescents, p. 239
- Obsessive-compulsive disorder, ADULT and CHILD over 12 years initially 50 mg daily, increased if necessary in steps of 50 mg at intervals of at least 1 week; max. 200 mg daily; CHILD 6–12 years initially 25 mg daily, increased to 50 mg daily after 1 week, further increased if necessary in steps of 50 mg at intervals of at least 1 week; max. 200 mg daily
- Panic disorder, post-traumatic stress disorder, or social anxiety disorder, ADULT over 18 years, initially 25 mg daily, increased after 1 week to 50 mg daily; if response is partial and if drug tolerated, dose increased in steps of 50 mg at intervals of at least 1 week to max. 200 mg daily

Sertraline  (Non-proprietary)  (A)
- Tablets, sertraline (as hydrochloride) 50 mg, net price 28-tab pack = £1.15; 100 mg, 28-tab pack = £1.53. Counselling, driving
- Lustral® (Pfizer)  (BNF 61)
- Tablets, f/c, sertraline (as hydrochloride) 50 mg (scored), net price 28-tab pack = £17.82; 100 mg, 28-tab pack = £29.16. Counselling, driving

4.3.4 Other antidepressant drugs

Agomelatine  is a melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

Duloxetine  inhibits the re-uptake of both serotonin and noradrenaline and is licensed to treat major depressive disorder.

The thioxanthenes flupentixol  (Fluanxol®)  has antidepressant properties when given by mouth in low doses. Flupentixol is also used for the treatment of psychoses (section 4.2.1 and section 4.2.2)

Mirtazapine  is a presynaptic alpha-, adrenoreceptor antagonist, increases central noradrenergic and serotonergic neurotransmission. It has few antimuscarinic effects, but causes sedation during initial treatment.

Reboxetine  is a selective inhibitor of noradrenaline re-uptake, has been introduced for the treatment of depressive illness.

Tryptophan  is licensed as adjunctive therapy for depression resistant to standard antidepressants; it has been associated with eosinophilia-myalgia syndrome. Tryptophan should be initiated under specialist supervision.

Venlafaxine  is a serotonin and noradrenaline re-uptake inhibitor; it lacks the sedative and antimuscarinic effects of the tricyclic antidepressants. Treatment with venlafaxine is associated with a higher risk of withdrawal effects compared with other antidepressants.
AGOMELATINE

Indications major depression

Cautions elderly; mania or hypomania; concomitant use of drugs associated with hepatic injury; excessive alcohol consumption; monitor liver function before treatment and after 6, 12 and 24 weeks of treatment, then as appropriate (discontinue if serum transaminases exceed 3 times the upper limit of reference range); interactions: Appendix 1 (agomelatine)

Contra-indications dementia

Renal impairment caution in moderate to severe impairment

Pregnancy caution

Breast-feeding avoid—present in milk in animal studies

Side-effects nausea, diarrhoea, constipation, abdominal pain, increased serum transaminases (see Cautions); headache, dizziness, drowsiness, insomnia, fatigue, anxiety; back pain; sweating; less commonly paraesthesia, blurred vision, and eczema; rarely hepatitis and rash; suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy; p. 235) also reported

Dose

• ADULT over 18 years, 25 mg at bedtime, increased if necessary after 2 weeks to 50 mg at bedtime

Valdoxan® (Servier) Tablets, orange-yellow, 1/c, agomelatine 25 mg, net price 28-tab pack = £43.77

DULOXETINE

Indications major depressive disorder; generalised anxiety disorder; diabetic neuropathy (section 6.1.5); stress urinary incontinence (section 7.4.2)

Cautions section 7.4.2

Contra-indications section 7.4.2

Hepatic impairment section 7.4.2

Renal impairment section 7.4.2

Pregnancy toxicity in animal studies—use only if potential benefit outweighs risk; risk of neonatal withdrawal symptoms if used near term

Breast-feeding section 7.4.2

Side-effects section 7.4.2

Dose

• Major depressive disorder, ADULT over 18 years, 60 mg once daily

• Generalised anxiety disorder, ADULT over 18 years, initially 30 mg daily, increased if necessary to 60 mg once daily; max. 120 mg daily

• Diabetic neuropathy, ADULT over 18 years, 60 mg once daily; max. 120 mg daily in divided doses

Note In diabetic neuropathy, discontinue if inadequate response after 2 months; review treatment at least every 3 months

Cymbalta® (Lilly) Capsules, duloxetine (as hydrochloride) 30 mg (white/blue), net price 28-cap pack = £22.40; 60 mg (green/blue), 28-cap pack = £27.72. Label: 2

Note The Scottish Medicines Consortium has advised (September 2006) that duloxetine (Cymbalta®) should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate

Yentreve® (Lilly) Section 7.4.2 (stress urinary incontinence)

FLUPENTIXOL (Flupentixol)

Indications depressive illness; psychoses (section 4.2.1)

Cautions cardiovascular disease (including cardiac disorders and cerebral arteriosclerosis), QT-interval prolongation (avoid concomitant administration of drugs that prolong QT interval); diabetes; senile confusional states, parkinsonism; elderly; acute porphyria (section 9.8.2); see also section 4.2.1; interactions: Appendix 1 (antipsychotics)

Contra-indications excitable and overactive patients; impaired consciousness; cardiovascular collapse; coma

Hepatic impairment can precipitate coma; consider serum-flupentixol concentration monitoring

Renal impairment increased cerebral sensitivity in severe impairment; manufacturer advises caution in renal failure

Pregnancy avoid unless potential benefit outweighs risk

Breast-feeding present in milk—avoid

Side-effects section 4.2.1; also hypersalivation, dysphagia, asthenia, hyperglycaemia, myalgia; torsade de pointes and sudden death also reported

Dose

• ADULT over 18 years, initially 1 mg (ELDERLY 500 micrograms) in the morning, increased after 1 week to 2 mg (ELDERLY 1 mg) if necessary; max. 3 mg (ELDERLY 1.5 mg) daily, doses above 2 mg (ELDERLY 1 mg) in divided doses, last dose before 4 pm; discontinue if no response after 1 week at max. dosage

Counselling Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening

Fluanxol® (Lundbeck) Tablets, yellow, s/c, flupentixol (as dihydrochloride) 500 micrograms, net price 60-tab pack = £2.63; 1 mg, 60-tab pack = £2.72. Label: 2, counselling, administration

Depixol® (Lundbeck) Section 4.2.1 (psychoses)

MIRTAZAPINE

Indications major depression

Cautions elderly, cardiac disorders, hypotension, history of urinary retention, susceptibility to angle-closure glaucoma, diabetes mellitus, psychoses (may aggravate psychotic symptoms), history of seizures or bipolar depression; interactions: Appendix 1 (mirtazapine)

Blood disorders Patients should be advised to report any fever, sore throat, stomatitis or other signs of infection during treatment. Blood count should be performed and the drug stopped immediately if blood dyscrasia suspected

Withdrawal Nausea, vomiting, dizziness, agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks

Hepatic impairment use with caution

Renal impairment clearance reduced by 30% if eGFR less than 40 mL/minute/1.73 m2; clearance reduced by 50% if eGFR less than 10 mL/minute/1.73 m2

Pregnancy use with caution—limited experience; monitor neonate for withdrawal effects

Breast-feeding present in milk; use only if potential benefit outweighs risk

Side-effects increased appetite, weight gain, dry mouth; postural hypotension, peripheral oedema;
4 Central nervous system

4.3.4 Other antidepressant drugs

drowsiness, fatigue, tremor, dizziness, abnormal dreams, confusion, anxiety, insomnia; arthritis, myalgia; less commonly syncope, hypotension, mania, hallucinations, movement disorders; rarely myoclonus; very rarely blood disorders (see Cautions), convulsions, hyponatraemia (see Hyponatraemia and Antidepressants Therapy, p. 233), suicidal behaviour (see p. 233), and angle-closure glaucoma.

Dose

• Initially 15–30 mg daily at bedtime increased within 2–4 weeks according to response; max. 45 mg daily as a single dose at bedtime or in 2 divided doses; CHILD under 18 years not recommended (see Depressive Illness in Children and Adolescents, p. 239)

Mirtazapine (Non-proprietary)

Tablets, mirtzapine 15 mg, net price 28-tab pack = £3.36; 30 mg, 28-tab pack = £2.04; 45 mg, 28-tab pack = £3.71. Label: 2, 25

Orodispensible tablets, mirtzapine 15 mg, net price 30-tab pack = £2.59; 30 mg, 30-tab pack = £2.94; 45 mg, 30-tab pack = £2.98. Label: 2, counselling, administration

Oral solution, mirtzapine 15 mg/mL, net price 66 mL = £47.00. Label: 2

Zispin SolTab® (Organon)

Orodispensible tablets, mirtzapine 15 mg, net price 6-tab pack = £3.84, 30-tab pack = £15.06; 30 mg, 30-tab pack = £15.06; 45 mg, 30-tab pack = £15.06. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1) counselling Zispin SolTab® should be placed on the tongue, allowed to disperse and swallowed

Edronax® (Pharmacia) Tablets, scored, reboxetine (as mesilate) 4 mg, net price 60-tab pack = £18.91. Counselling, driving

TRYPTOPHAN

(-L-Tryptophan)

Indications see notes above

Cautions eosinophilia-myalgia syndrome has been reported (withdraw treatment if increased eosinophil count, myalgia, arthralgia, fever, dyspnoea, neuropathy, oedema or skin lesions develop until possibility of eosinophilia-myalgia syndrome excluded); interactions: Appendix 1 (tryptophan)

Contra-indications history of eosinophilia-myalgia syndrome following use of tryptophan

Pregnancy no information available

Breast-feeding no information available

Side-effects drowsiness, nausea, headache, light-headedness, suicidal behaviour (see p. 233); eosinophilia-myalgia syndrome, see Cautions

Dose

• 1 g 3 times daily; max. 6 g daily; ELDERLY lower dose may be appropriate especially in renal or hepatic impairment; CHILD not recommended

Optinax® (Merck Serono) Tablets, scored, tryptophan 500 mg, net price 84-tab pack = £23.47. Label: 3

VENLAFAXINE

Indications major depression, generalised anxiety disorder

Cautions heart disease (monitor blood pressure); diabetes; history of epilepsy; history or family history of mania; susceptibility to angle-closure glaucoma; concomitant use of drugs that increase risk of bleeding, history of bleeding disorders; interactions: Appendix 1 (venlafaxine)

Driving May affect performance of skilled tasks (e.g. driving)

Withdrawal Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks

Contra-indications conditions associated with high risk of cardiac arrhythmia, uncontrolled hypertension

Hepatic impairment consider reducing dose by 50% in mild or moderate impairment; use with caution and reduce dose by at least 50% in severe impairment

Renal impairment use with caution; use half normal dose (immediate-release tablets may be given once daily) if eGFR less than 30 mL/minute/1.73 m²

Pregnancy avoid unless potential benefit outweighs risk—toxicity in animal studies; risk of withdrawal effects in neonate

Breast-feeding present in milk—avoid

Side-effects constipation, nausea, anorexia, weight changes, vomiting; hypertension; palpitation, vasodilation, changes in serum cholesterol; chilli, yawning; dizziness, dry mouth, insomnia, nervousness, drowsiness, asthenia, headache, abnormal dreams, anxiety, confusion, hypertonia, sensory disturbances, tremor; difficulty with micturition, sexual dysfunction, menstrual disturbances; visual disturbances, mydriasis (very rarely angle-closure glaucoma); sweating; less commonly—bruxism, diarrhoea, taste disturbance, postural hypotenstion, arhythmias, agitation, apathy, incoordination, hallucinations, myoclonus, urinary
Central nervous system stimulants include the amphetamines (notably dexamfetamine) and related drugs (e.g. methylphenidate). They have very few indications and in particular, should not be used to treat depression, obesity, senility, delirium, or for relief of fatigue.

CMS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a shared-care arrangement. Treatment of ADHD often needs to be continued into adolescence, and may need to be continued into adulthood. Initiating treatment in adulthood is unlicensed.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, and preferences of the patient and carers. Methylphenidate and atomoxetine are used for the management of ADHD; dexamfetamine is an alternative in children who do not respond to these drugs. Before initiation of drug therapy, and every 6 months thereafter, pulse, blood pressure, weight, and height should be measured.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

Modafinil is used for the treatment of daytime sleepiness associated with narcolepsy or obstructive sleep apnoea syndrome; dependence with long-term use cannot be excluded and it should therefore be used with caution.

Dexamfetamine and methylphenidate [unlicensed indication] are also used to treat narcolepsy.

**ATOMOXETINE**

**Indications** attention deficit hyperactivity disorder (initiated by a specialist physician experienced in managing the condition)

**Cautions** see notes above; also cardiovascular disease including hypertension and tachycardia; structural cardiac abnormalities; QT-interval prolongation (avoid concomitant administration of drugs that prolong QT interval); psychosis or mania; history of seizures; aggressive behaviour, hostility, or emotional lability; susceptibility to angle-closure glaucoma; interactions: Appendix 1 (atomoxetine) 

**Hepatic disorders** Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice

**Suicidal ideation** Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression
Hepatic impairment  halve dose in moderate impairment; quarter dose in severe impairment; see also Hepatic Disorders above

Pregnancy  no information available; avoid unless potential benefit outweighs risk

Breast-feeding  avoid—present in milk in animal studies

Side-effects  anorexia, dry mouth, nausea, vomiting, abdominal pain, constipation, dyspepsia, flatulence; palpitation, tachycardia, increased blood pressure, postural hypotension, hot flushes; sleep disturbance, dizziness, headache, fatigue, lethargy, depression, psychotic or manic symptoms, aggression, hostility, emotional lability, drowsiness, anxiety, irritability, tremor, rigors; urinary retention, enuresis, prostatitis, sexual dysfunction, menstrual disturbances; mydriasis, conjunctivitis; dermatitis, pruritus, rash, sweating, tremor, rigors; urinary retention, enuresis, prostatitis, emotional lability, drowsiness; susceptibility to angle-closure glaucoma, and Raynaud's phenomenon

Dose
- ADULT over 18 years, body-weight over 70 kg, initially 40 mg daily for 7 days, increased according to response; usual maintenance 80–100 mg daily, but may be increased to max. 120 mg daily [unlicensed] under the direction of a specialist; CHILD 6–18 years, body-weight over 70 kg, initially 40 mg daily for 7 days, increased according to response; usual maintenance 80 mg daily, but may be increased to max. 120 mg daily [unlicensed] under the direction of a specialist; ADULT and CHILD over 6 years, body-weight under 70 kg, initially 500 micrograms/kg daily for 7 days, increased according to response; usual maintenance 1.2 mg/kg daily, but may be increased to max. 1.8 mg/kg daily [max. 120 mg daily] [unlicensed] under the direction of a specialist

Note  Total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening

Strattera® (Lilly) (see also Cautions); seizures, angle-closure glaucoma, and Raynaud's phenomenon

Capsules, atomoxetine (as hydrochloride) 10 mg (white), net price 7-cap pack = £15.62, 28-cap pack = £62.46; 18 mg (gold/white), 7-cap pack = £83.28. Label: 3

Dose
- Narcolepsy, initially 10 mg [ELDERLY] 5 mg daily in divided doses increased at weekly intervals by 10 mg [ELDERLY] 5 mg daily to a max. of 60 mg daily
- Refractory attention deficit hyperactivity disorder, ADULT over 18 years [unlicensed use], initially 5 mg twice daily, increased at weekly intervals according to response; max. 60 mg daily; CHILD 6–18 years, initially 5–10 mg daily, increased if necessary at weekly intervals by 5 mg daily, usual max. 1 mg/kg (up to 20 mg) daily (40 mg daily has been required in some children)

Note  Maintenance dose given in 2–4 divided doses

Dexamfetamine (Non-proprietary) (see also under Cautions); dry mouth, sweating, intestinal symptoms, growth restriction in children

Indications  attention deficit hyperactivity disorder (under specialist supervision); narcolepsy [unlicensed indication]

Cautions  see notes above; also anorexia; mild hypertension (contra-indicated if moderate or severe); psychosis or bipolar disorder; monitor for aggressive behaviour or hostility during initial treatment; history of epilepsy (discontinue if convulsions occur); tics and Tourette syndrome (use with caution)—discontinue if tics occur; monitor growth in children (see also below); susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; data on safety and efficacy of long-term use not complete; acute porphyria (section 9.8.2); interactions: Appendix 1 (sympathomimetics)

Methylphenidate hydrochloride

Indications  attention deficit hyperactivity disorder (under specialist supervision); narcolepsy [unlicensed indication]

Cautions  see notes above; also monitor for psychiatric disorders; anxiety or agitation; tics or a family history of Tourette syndrome; epilepsy (discontinue if increased seizure frequency); susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; interactions: Appendix 1 (sympathomimetics)

Contra-indications  severe depression, suicidal ideation; anorexia nervosa; drug or alcohol dependence; psychosis; uncontrolled bipolar disorder; hyperthyroidism; cardiovascular disease (including heart failure);
Ritalin
Methylphenidate Hydrochloride.
Narcolepsy [unlicensed indication], 10–60 mg (usually
Attention deficit hyperactivity disorder,
Side-effects abdominal pain, nausea, vomiting, diarr-
hoea, dyspepsia, dry mouth, anorexia, reduced weight
gain; tachycardia, palpitation, arrhythmias, changes in
blood pressure; cough, nasopharyngitis; tics (very
rarely Tourette syndrome), insomnia, nervousness,
asthenia, depression, irritability, aggression, head-
ache, drowsiness, dizziness, movement disorders;
fever; arthralgia; rash, pruritus, alopecia; growth
restriction; less commonly constipation, dyspnoea,
abnormal dreams, confusion, suicidal ideation,
urinary frequency, haematuria, muscle cramps, epis-
taxis; rarely angina, sweating, and visual disturbances;
very rarely hepatic dysfunction, myocardial infarction,
cerebral arteritis, psychosis, neuroleptic malignant
sindrome, tolerance and dependence, blood disor-
ders including leucopenia and thrombocytopenia,
angle-closure glaucoma, exfoliative dermatitis, and
erythema multiforme; supraventricular tachycardia,
bradycardia, and convulsions also reported

Dose
- Attention deficit hyperactivity disorder, ADULT over 18
years [unlicensed use], 5 mg 2–3 times daily increased
if necessary at weekly intervals according to response,
max. 100 mg daily in 2–3 divided doses; CHILD 6–18
years, initially 5 mg 1–2 times daily; increased if
necessary at weekly intervals by 5–10 mg daily; usual
max. 60 mg daily in 2–3 divided doses but may be
increased to 2.1 mg/kg daily in 2–3 divided doses
(max. 90 mg daily) under the direction of a specialist;
discontinue if no response after 1 month; CHILD 4–6
years see BNF for Children
Evening dose if effect wears off in evening (with rebound
hyperactivity) a dose at bedtime may be appropriate
(establish need with trial bedtime dose)
Note Treatment may be started using a modified-release
preparation
- Narcolepsy [unlicensed indication], 10–60 mg (usually
20–30 mg) daily in divided doses before meals

Methylphenidate Hydrochloride (Non-proprietary)
Tablets, methylphenidate hydrochloride 5 mg, net
price 30-tab pack = £2.67; 10 mg, 30-tab pack = £6.74;
20 mg, 30-tab pack = £9.59
Brands include Medikinet®
Ritalin® (Novartis)
Tablets, scored, methylphenidate hydrochloride
10 mg, net price 30-tab pack = £5.57

MODAFINIL
Concerta® XL (Janssen-Cilag)
Tablets, m/r, methylphenidate hydrochloride 18 mg
(yellow), net price 30-tab pack = £31.19; 27 mg (grey),
30-tab pack = £36.81; 36 mg (white), 30-tab pack = £42.45. Label: 25
Note Concerta® XL tablets consist of an immediate-release
component (22% of the dose) and a modified-release component
(78% of the dose)
Counselling Tablet membrane may pass through gastro-intestinal
tract unchanged
Cautions dose form not appropriate for use in dysphagia or if
gastro-intestinal lumen restricted
Dose attention deficit hyperactivity disorder, ADULT over 18
years [unlicensed use], initially 18 mg once daily in the morning,
adjusted at weekly intervals according to response, max. 108 mg
daily; CHILD 6–18 years, initially 18 mg once daily (in the morn-
ing), increased if necessary at weekly intervals by 18 mg according
to response, usual max. 54 mg once daily but may be increased to
2.1 mg/kg daily (max. 108 mg daily) [unlicensed] under the
direction of a specialist; discontinue if no response after 1 month
Note Total daily dose of 15 mg of standard-release formulation is
equivalent to Concerta® XL 18 mg once daily

Equasym XL® (Shire)
Capsules, m/r, methylphenidate hydrochloride 10 mg
(white/green), net price 30-cap pack = £25.20; 20 mg
(white/blue), 30-cap pack = £30.00; 30 mg (white/
brown), 30-cap pack = £35.00. Label: 25
Note Equasym XL® capsules consist of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose)
Dose attention deficit hyperactivity disorder, ADULT over 18
years [unlicensed use], initially 10 mg once daily in the morning
before breakfast, increased gradually at weekly intervals if
necessary, max. 100 mg daily; CHILD 6–18 years, initially 10 mg
once daily in the morning before breakfast, increased gradually at weekly
intervals if necessary, usual max. 60 mg daily but may be
increased to 2.1 mg/kg daily (max. 90 mg daily) [unlicensed]
under the direction of a specialist; discontinue if no response after 1 month
Note Contents of capsule can be sprinkled on a tablespoon of
apple sauce (then swallowed immediately without chewing)

Medikinet XL® (Flynn)
Capsules, m/r, methylphenidate hydrochloride 10 mg
(filac/white), net price 28-cap pack = £20.18; 20 mg
(lilac), 28-cap pack = £26.91; 30 mg (purple/light
grey), 28-cap pack = £31.39; 40 mg (purple/grey), 28-
cap pack = £34.20. Label: 25
Note Medikinet XL® capsules consist of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose)
Dose attention deficit hyperactivity disorder, ADULT over 18
years [unlicensed use], initially 10 mg once daily in the morning
with breakfast, adjusted at weekly intervals according to response,
max. 100 mg daily; CHILD 6–18 years, initially 10 mg once daily in
the morning with breakfast, adjusted at weekly intervals according to response,
usual max. 60 mg daily but may be increased to
2.1 mg/kg daily (max. 90 mg daily) [unlicensed] under the
direction of a specialist; discontinue if no response after 1 month
Note Contents of capsule can be sprinkled on a tablespoon of
apple sauce (then swallowed immediately without chewing)

Indications daytime sleepiness associated with
narcolepsy, obstructive sleep apnoea syndrome, and
chronic shift work
Cautions monitor blood pressure and heart rate in
hypertensive patients (but see Contra-indications);
history of psychosis, depression, mania, alcohol or
drug abuse; discontinue treatment if psychiatric
symptoms develop; possibility of dependence; dis-
continue treatment if rash develops; interactions:
Appendix 1 (modafinil)
Contra-indications moderate to severe uncontrolled
hypertension, arhythmia; history of left ventricular
hypertrophy, cor pulmonale, or of clinically significant
signs of CNS stimulant-induced mitral valve prolapse
(including ischaemic ECG changes, chest pain and
arrhythmias)
Hepatic impairment halve dose in severe impairment
Renal impairment halve dose in severe impairment
Pregnancy avoid
Breast-feeding avoid—present in milk in animal
studies
Side-effects dry mouth, appetite changes, gastro-
intestinal disturbances (including nausea, diarrhoea,
constipation, and dyspepsia), abdominal pain; tachy-
cardia, vasodilatation, chest pain, palpitation, head-
4.5 Drugs used in the treatment of obesity

4.5.1 Anti-obesity drugs acting on the gastro-intestinal tract

Orlistat: a lipase inhibitor, reduces the absorption of dietary fat. It is used in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m² or more in individuals with a BMI of 28 kg/m² in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia.

Orlistat should be used in conjunction with other lifestyle measures to manage obesity (section 4.5); treatment should only be continued beyond 12 months after discussing potential benefits and risks with the patient. On stopping orlistat, there may be a gradual reversal of weight loss. Some of the weight loss in those taking orlistat probably results from individuals reducing their fat intake to avoid severe gastro-intestinal effects including steatorrhoea. Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

Methylcellulose is claimed to reduce food intake by producing a feeling of satiety, but there is little evidence to support its use in the management of obesity.

4.5.2 Centrally acting appetite suppressants

Orlistat is claimed to reduce food intake by producing a feeling of satiety, but there is little evidence to support its use in the management of obesity.

Orlistat: a lipase inhibitor, reduces the absorption of dietary fat. It is used in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m² or more in individuals with a BMI of 28 kg/m² in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia.

Orlistat should be used in conjunction with other lifestyle measures to manage obesity (section 4.5); treatment should only be continued beyond 12 months after discussing potential benefits and risks with the patient. On stopping orlistat, there may be a gradual reversal of weight loss. Some of the weight loss in those taking orlistat probably results from individuals reducing their fat intake to avoid severe gastro-intestinal effects including steatorrhoea. Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

Methylcellulose is claimed to reduce food intake by producing a feeling of satiety, but there is little evidence to support its use in the management of obesity.
Phenothiazines, especially in children. Some antihistamines, and cytotoxics. Prochlorperazine emesis caused by drugs such as opioids, general anaesthesia, diffuse neoplastic disease, radiation sickness, and the treatment of nausea and vomiting associated with centrally by blocking the chemoreceptor trigger zone. The adverse effects (drowsiness and antimuscarinic effects) another but their duration of action and incidence of no evidence that any one antihistamine is superior to ting resulting from many underlying conditions. There is are effective against nausea and vomiting is known because otherwise they may delay Antiemetics should be prescribed only when the cause does not outweigh the risk of serious adverse effects.

Dose
- ADULT over 18 years, 120 mg taken immediately before, during, or up to 1 hour after each main meal (up to max. 360 mg daily); continue treatment beyond 12 weeks only if weight loss since start of treatment exceeds 5% (target for initial weight loss may be lower in patients with type 2 diabetes); CHILD over 12 years, initiated by specialist only [unlicensed use] Note: If a meal is missed or contains no fat, the dose of orlistat should be omitted

4.5.2 Centrally acting appetite suppressants

Phentermine and diethylpropion are central stimulants; they are not recommended for the treatment of obesity. Phentermine has been associated with a risk of pulmonary hypertension. Sibutramine, dexfenfluramine, and fenfluramine have been withdrawn from the market because the benefit of treatment does not outweigh the risk of serious adverse effects.

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The phenothiazines are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine, perphenazine, and trifluoperazine are less sedating than chlorpromazine; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone. Other antipsychotic drugs including haloperidol and levomepromazine are used for the relief of nausea and vomiting in terminal illness (see Palliative Care, p. 22).

Metoclopramide is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease. In postoperative nausea and vomiting, metoclopramide in a dose of 10 mg has limited efficacy. High-dose metoclopramide injection is now less commonly used for cytotoxic-induced nausea and vomiting. As with the phenothiazines, metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine (section 4.9.2) will abort dystonic attacks.

Donomeridone acts at the chemoreceptor trigger zone; it is used for the relief of nausea and vomiting, especially when associated with cytotoxic therapy. It has the advantage over metoclopramide and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson’s disease, it is used to prevent nausea and vomiting during treatment with apomorphine and also to treat nausea caused by other dopaminergic drugs (section 4.9.1). Domperidone is also used to treat vomiting due to emergency hormonal contraception (section 7.3.5).

Granisetron, ondansetron, and palonosetron are specific 5HT3-receptor antagonists which block 5HT3 receptors in the gastro-intestinal tract and in the CNS. Granisetron and ondansetron are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy.

Dexamethasone (section 6.3.2) has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide, prochlorperazine, lorazepam, or a 5HT3 antagonist (section 8.1).

Aprepitant and fosaprepitant are neurokinin 1 receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone and a 5HT3 antagonist.

Nabumetone is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics. Side-effects such as drowsiness and dizziness occur frequently with standard doses.
4.6 Drugs used in nausea and vertigo

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as promethazine, may be required. Prochlorperazine or metoclopramide may be considered as second-line treatments. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine must be considered in order to reduce the risk of Wernicke’s encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include 5HT
d receptor antagonists, droperidol, dexamethasone (section 6.3.2), some phenothiazines (e.g. prochlorperazine), and antihistamines (e.g. cyclizine). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

Motion sickness

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develops. The most effective drug for the prevention of motion sickness is hyoscine. A transdermal hyoscine patch provides prolonged activity but it needs to be applied several hours before travelling. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine is preferred. The 5HT
d antagonists, domperidone, metoclopramide, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffective in motion sickness.

Other vestibular disorders

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière’s disease and middle-ear surgery can be difficult to treat. Betahistine is an analogue of histamine and is claimed to reduce endolympathic pressure by improving the microcirculation. Betahistine is licensed for vertigo, tinnitus, and hearing loss associated with Ménière’s disease.

Cytotoxic chemotherapy

For the management of nausea and vomiting induced by cytotoxic chemotherapy, see section 8.1.

Palliative care

For the management of nausea and vomiting in palliative care, see p. 22 and p. 23.

Migraine

For the management of nausea and vomiting associated with migraine, see p. 277.

Antihistamines

CINNARIZINE

Indications vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière’s disease; motion sickness

Cautions section 3.4.1; also Parkinson’s disease

Contra-indications section 3.4.1

Hepatic impairment section 3.4.1

Renal impairment use with caution—no information available

Pregnancy section 3.4.1

Breast-feeding section 3.4.1

Side-effects section 3.4.1; also rarely weight gain, sweating, lichen planus, and lupus-like skin reactions

Dose

● Vestibular disorders, 30 mg 3 times daily; CHILD 5–12 years 15 mg 3 times daily

● Motion sickness, 30 mg 2 hours before travel then 15 mg every 8 hours during journey if necessary; CHILD 5–12 years, 15 mg 2 hours before travel then 7.5 mg every 8 hours during journey if necessary

Cinnarizine (Non-proprietary)

Tablets, cinnarizine 15 mg, net price 84-tab pack = £8.84. Label: 2

Stugeron® (Janssen-Cilag)

Tablets, scored, cinnarizine 15 mg, net price 15-tab pack = £4.18. Label: 2

With dimenhydrinate

Arlevert® (Hampton)

Tablets, cinnarizine 20 mg, dimenhydrinate 40 mg, net price 100-tab pack = £24.00. Label: 2

Dose ADULT over 18 years, 1 tablet 3 times daily
4.6 Drugs used in nausea and vertigo

**CYCLIZINE**

**Indications** nausea, vomiting, vertigo, motion sickness, labyrinthine disorders

**Cautions** section 3.4.1; severe heart failure; may counteract haemodynamic benefits of opioids; **Interactions**: Appendix 1 (antihistamines)

**Contra-indications** see notes in section 3.4.1

**Hepatic impairment** section 3.4.1

**Pregnancy** section 3.4.1

**Breast-feeding** no information available

**Side-effects** section 3.4.1; also hypertension, paraesthesia, and twitching

**Dose**
- By mouth, cyclizine hydrochloride 50 mg up to 3 times daily; CHILD 6–12 years 25 mg up to 3 times daily
- By intramuscular or intravenous injection, cyclizine lactate 50 mg 3 times daily

**Valoid** (Amdipharm)

- Tablets, scored, cyclizine hydrochloride 50 mg, net price 100-tab pack = £7.41. Label: 2
- Injection (Amdipharm), cyclizine lactate 50 mg/mL, net price 1-ML amp = 51p

**Phenothiazines and related drugs**

**CHLORPROMAZINE HYDROCHLORIDE**

**Indications** nausea and vomiting of terminal illness (where other drugs have failed or are not available); other indications (section 4.2.1)

**Cautions** see Chlorpromazine Hydrochloride, section 4.2.1

**Contra-indications** see notes in section 4.2.1

**Hepatic impairment** see notes in section 4.2.1

**Renal impairment** see Promethazine Hydrochloride, section 3.4.1

**Pregnancy** see notes in section 4.2.1

**Breast-feeding** see notes in section 4.2.1

**Side-effects** see Chlorpromazine Hydrochloride, section 4.2.1

**Dose**
- By mouth, 10–25 mg every 4–6 hours; CHILD 500 micrograms/kg every 4–6 hours (1–5 years max. 40 mg daily, 6–12 years max. 75 mg daily)
- By deep intramuscular injection initially 25 mg then 25–50 mg every 3–4 hours until vomiting stops; CHILD 500 micrograms/kg every 6–8 hours (1–5 years max. 40 mg daily, 6–12 years max. 75 mg daily)
- By rectum in suppositories, chlorpromazine 100 mg every 6–8 hours [unlicensed]

**Preparations**

Section 4.2.1

**PROMETHAZINE HYDROCHLORIDE**

**Indications** nausea, vomiting, vertigo, labyrinthine disorders, motion sickness, allergy and urticaria (section 3.4.1); sedation (section 4.1.1)

**Cautions** see Promethazine Hydrochloride, section 3.4.1

**Contra-indications** see notes in section 3.4.1

**Hepatic impairment** see notes in section 3.4.1

**Renal impairment** see Promethazine Hydrochloride, section 3.4.1

**Pregnancy** see notes in section 3.4.1

**Breast-feeding** see notes in section 3.4.1

**Side-effects** see Promethazine Hydrochloride, section 3.4.1

**Dose**
- By mouth, 20–25 mg at bedtime on night before travel, repeat following morning if necessary; CHILD 2–5 years 5 mg at night, and following morning if necessary, 5–10 years 10 mg at night, and following morning if necessary

**Preparations**

Section 3.4.1

**PROMETHAZINE TEOCLATE**

**Indications** nausea, vertigo, labyrinthine disorders, motion sickness (acts longer than the hydrochloride)

**Cautions** section 3.4.1; severe coronary artery disease, asthma, bronchitis, bronchiectasis; Reye’s syndrome

**Contra-indications** section 3.4.1

**Hepatic impairment** section 3.4.1

**Renal impairment** use with caution

**Pregnancy** section 3.4.1

**Breast-feeding** section 3.4.1

**Side-effects** section 3.4.1

**DROPERIDOL**

**Indications** prevention and treatment of postoperative nausea and vomiting

**Cautions** section 4.2.1; also chronic obstructive pulmonary disease or respiratory failure; electrolyte disturbances; history of alcohol abuse; continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration; **Interactions**: Appendix 1 (droperidol)

**Contra-indications** section 4.2.1; QT-interval prolongation (avoid concomitant administration of drugs
4.6 Drugs used in nausea and vertigo

that prolong QT interval); hypokalaemia; hypomagnesaemia; bradycardia

Hepatic impairment in postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required; for nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose

Renal impairment in postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required; for nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose

Renal impairment in postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required; for nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose

Pregnancy section 4.2.1

Breast-feeding see notes in section 4.2.1

Side-effects see Prochlorperazine, section 4.2.1

Contra-indications

Indications severe nausea, vomiting (see notes above); other indications (see section 4.2.1)

Cautions see notes in section 4.2.1

Hepatic impairment see notes in section 4.2.1

Renal impairment see notes in section 4.2.1

Pregnancy see notes in section 4.2.1

Breast-feeding see notes in section 4.2.1

Side-effects see Prochlorperazine, section 4.2.1

Dose

Note Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate

By mouth, nausea and vomiting, acute attack, 20 mg initially then 10 mg after 2 hours; prevention 5–10 mg 2–3 times daily; CHILD (over 10 kg only) 250 micrograms/kg 2–3 times daily

Labyrinthine disorders, 5 mg 3 times daily, gradually increased if necessary to 30 mg daily in divided doses, then reduced after several weeks to 5–10 mg daily; CHILD not recommended

By deep intramuscular injection, nausea and vomiting, 12.5 mg when required followed if necessary after 6 hours by an oral dose, as above; CHILD and ADOLESCENT under 18 years, see BNF for Children

Prochlorperazine (Non-proprietary) (UK)

Tablets, prochlorperazine maleate 5 mg, net price 28-tab pack = £1.25, 84-tab pack = £2.28. Label: 2

Injection, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p

Stemetil® (Sanofi-Aventis) (UK)

Tablets, prochlorperazine maleate 5 mg (off-white), net price 28-tab pack = £1.98, 84-tab pack = £5.94. Label: 2

Injection, prochlorperazine mesilate 5 mg/5 mL, net price 100-mL pack = £3.34. Label: 2

Syrup, straw-coloured, prochlorperazine mesilate 5 mg/5 mL, net price 100-mL pack = £3.34. Label: 2

Injection, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p

Buccal preparation

Buccastem® (Alliance) (UK)

Tablets (buccal), pale yellow, prochlorperazine maleate 3 mg, net price 5 × 10-tab pack = £5.89. Label: 2, counselling, administration, see under Dose below

Dose ADULT and CHILD over 12 years, 1–2 tablets twice daily, tablets are placed high between upper lip and gum and left to dissolve

1. Prochlorperazine maleate can be sold to the public for adults over 18 years (provided packs do not contain more than 24 mg) for the treatment of nausea and vomiting in previously diagnosed migraine only (max. daily dose 12 mg)

PERPHENAZINE

Indications severe nausea, vomiting (see notes above); other indications (see section 4.2.1)

Cautions see notes in section 4.2.1

Hepatic impairment see notes in section 4.2.1

Renal impairment see notes in section 4.2.1

Pregnancy see notes in section 4.2.1

Breast-feeding see notes in section 4.2.1

Side-effects see Perphenazine, section 4.2.1

Dose

• Prevention and treatment of postoperative nausea and vomiting, ADULT over 18 years, by intravenous injection, 0.625–1.25 mg (ELDERLY 625 micrograms) 30 minutes before end of surgery, repeated every 6 hours as required; CHILD over 2 years (second-line use only) 20–50 micrograms/kg (max. 1.25 mg)

• Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA), ADULT over 18 years, by intravenous injection, 15–50 micrograms of droperidol for every 1 mg of morphine in PCA (max. 5 mg droperidol daily); ELDERLY reduce dose

Perphenazine (Non-proprietary) (UK)

Injection, droperidol 2.5 mg/mL, net price 1–mL amp = £3.94

PROCHLORPERAZINE

Indications severe nausea, vomiting, vertigo, labyrinthine disorders (see notes above); other indications section 4.2.1

Cautions see Prochlorperazine, section 4.2.1; oral route only for children (avoid if under 10 kg); elderly (see notes above)

Contra-indications see Prochlorperazine, section 4.2.1

Hepatic impairment see notes in section 4.2.1

Renal impairment see notes in section 4.2.1

Pregnancy see notes in section 4.2.1

Breast-feeding see notes in section 4.2.1

Side-effects see Prochlorperazine, section 4.2.1

Dose

Note Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate

By mouth, nausea and vomiting, acute attack, 20 mg initially then 10 mg after 2 hours; prevention 5–10 mg 2–3 times daily; CHILD (over 10 kg only) 250 micrograms/kg 2–3 times daily

Labyrinthine disorders, 5 mg 3 times daily, gradually increased if necessary to 30 mg daily in divided doses, then reduced after several weeks to 5–10 mg daily; CHILD not recommended

By deep intramuscular injection, nausea and vomiting, 12.5 mg when required followed if necessary after 6 hours by an oral dose, as above; CHILD and ADOLESCENT under 18 years, see BNF for Children

Prochlorperazine (Non-proprietary) (UK)

Tablets, prochlorperazine maleate 5 mg, net price 28-tab pack = £1.25, 84-tab pack = £2.28. Label: 2

Injection, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p

Stemetil® (Sanofi-Aventis) (UK)

Tablets, prochlorperazine maleate 5 mg (off-white), net price 28-tab pack = £1.98, 84-tab pack = £5.94. Label: 2

Injection, prochlorperazine mesilate 5 mg/5 mL, net price 100-mL pack = £3.34. Label: 2

Injection, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p

Buccal preparation

Buccastem® (Alliance) (UK)

Tablets (buccal), pale yellow, prochlorperazine maleate 3 mg, net price 5 × 10-tab pack = £5.89. Label: 2, counselling, administration, see under Dose below

Dose ADULT and CHILD over 12 years, 1–2 tablets twice daily, tablets are placed high between upper lip and gum and left to dissolve

1. Prochlorperazine maleate can be sold to the public for adults over 18 years (provided packs do not contain more than 24 mg) for the treatment of nausea and vomiting in previously diagnosed migraine only (max. daily dose 12 mg)

TRIFLUOPERAZINE

Indications severe nausea and vomiting (see notes above); other indications (see section 4.2.1)

Cautions see notes in section 4.2.1

Contra-indications see notes in section 4.2.1

Hepatic impairment see notes in section 4.2.1

Renal impairment see notes in section 4.2.1

Pregnancy see notes in section 4.2.1

Breast-feeding see notes in section 4.2.1

Side-effects see Trifluoperazine, section 4.2.1

Dose

Note Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate

By mouth, nausea and vomiting, acute attack, 20 mg initially then 10 mg after 2 hours; prevention 5–10 mg 2–3 times daily; CHILD (over 10 kg only) 250 micrograms/kg 2–3 times daily

Labyrinthine disorders, 5 mg 3 times daily, gradually increased if necessary to 30 mg daily in divided doses, then reduced after several weeks to 5–10 mg daily; CHILD not recommended

By deep intramuscular injection, nausea and vomiting, 12.5 mg when required followed if necessary after 6 hours by an oral dose, as above; CHILD and ADOLESCENT under 18 years, see BNF for Children

Prochlorperazine (Non-proprietary) (UK)

Tablets, prochlorperazine maleate 5 mg, net price 28-tab pack = £1.25, 84-tab pack = £2.28. Label: 2

Injection, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p

Stemetil® (Sanofi-Aventis) (UK)

Tablets, prochlorperazine maleate 5 mg (off-white), net price 28-tab pack = £1.98, 84-tab pack = £5.94. Label: 2

Injection, prochlorperazine mesilate 5 mg/5 mL, net price 100-mL pack = £3.34. Label: 2

Injection, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p

Buccal preparation

Buccastem® (Alliance) (UK)

Tablets (buccal), pale yellow, prochlorperazine maleate 3 mg, net price 5 × 10-tab pack = £5.89. Label: 2, counselling, administration, see under Dose below

Dose ADULT and CHILD over 12 years, 1–2 tablets twice daily, tablets are placed high between upper lip and gum and left to dissolve

1. Prochlorperazine maleate can be sold to the public for adults over 18 years (provided packs do not contain more than 24 mg) for the treatment of nausea and vomiting in previously diagnosed migraine only (max. daily dose 12 mg)
Domperidone and metoclopramide

DOMPERIDONE

**Indications**
nausea and vomiting, dyspepsia, gastrointestinal reflux

**Cautions**
children; interactions: Appendix 1 (domperidone)

**Contra-indications**
prolactinoma; if increased gastrointestinal motility harmful

**Hepatic impairment**
avoid

**Renal impairment**
reduce dose

**Pregnancy**
use only if potential benefit outweighs risk

**Breast-feeding**
amount too small to be harmful

**Side-effects**
rarely gastro-intestinal disturbances (including cramps) and hyperprolactinaemia; very rarely ventricular arrhythmias, agitation, drowsiness, nervousness, seizures, extrapyramidal effects, headache, and rashes; also reported QT-interval prolongation

**Dose**

- **By mouth**
  - **ADULT** and **CHILD**
    - body-weight over 35 kg, 10–20 mg 3–4 times daily; max. 80 mg daily; **CHILD** body-weight up to 35 kg (nausea and vomiting only), 250–500 micrograms/kg 3–4 times daily; max. 2.4 mg/kg daily
  - **By rectum**
    - **ADULT** and **CHILD**
      - body-weight over 35 kg, 60 mg twice daily; **CHILD** 15–35 kg (nausea and vomiting only), 30 mg twice daily; **CHILD** body-weight under 15 kg, not recommended

**Domperidone**

- **Non-proprietary**
  - Tablets, 10 mg (as maleate), net price 30-tab pack = £1.12; 100-tab pack = £1.90
  - Suspension, domperidone 5 mg/5 mL, net price 200-mL pack = £12.00

**Mettolium**

- (Sanofi-Aventis)
  - Tablets, f/c, domperidone 10 mg (as maleate), net price 30-tab pack = £2.71; 100-tab pack = £9.04
  - Suppositories domperidone 30 mg, net price 10 = £3.06

METOCLOPRAMIDE

**Indications**
adults, nausea and vomiting, particularly in gastro-intestinal disorders (section 1.2) and treatment with cytotoxics or radiotherapy; migraine (section 4.7.4.1)

**Patients under 20 years**
Use restricted to severe intractable vomiting of known cause, vomiting of radiotherapy and cytotoxics, to aid gastro-intestinal intubation, premedication; dose should be determined on the basis of body-weight

**Cautions**
elderly, young adults (15–19 years old), and children; atopic allergy (including asthma); may mask underlying disorders such as cerebral irritation; acute porphyria (section 9.8.2); epilepsy; interactions: Appendix 1 (metoclopramide)

**Contra-indications**
gastro-intestinal obstruction, perforation or haemorrhage; 3–4 days after gastro-intestinal surgery; phaeochromocytoma

**Hepatic impairment**
reduce dose

**Renal impairment**
avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions

**Pregnancy**
not known to be harmful

**Breast-feeding**
small amount present in milk; avoid

**Side-effects**
extrapyramidal effects (especially in children and young adults (15–19 years old)—see p. 249), hyperprolactinaemia, occasionally tardive dyskinesia on prolonged administration; also reported, anxiety, confusion, drowsiness, restlessness, diarrhoea, depression, neuroleptic malignant syndrome, rashes, pruritus, oedema; cardiac conduction abnormalities reported following intravenous administration; rarely methaemoglobinemia (more severe in G6PD deficiency)

**Dose**

- **By mouth**
  - or by intramuscular injection or by intravenous injection over 1–2 minutes, nausea and vomiting, 10 mg (5 mg in young adults 15–19 years, body-weight under 60 kg) 3 times daily; **CHILD** up to 1 year (body-weight up to 10 kg) 100 micrograms/kg (max. 1 mg) twice daily, 1–3 years (body-weight 10–14 kg) 1 mg 2–3 times daily, 3–5 years (body-weight 15–19 kg) 2 mg 2–3 times daily, 5–9 years (body-weight 20–29 kg) 2.5 mg 3 times daily, 9–15 years (body-weight 30 kg and over) 5 mg 3 times daily
  - **Note** Daily dose of metoclopramide should not normally exceed 500 micrograms/kg, particularly for children and young adults (restricted use, see above)
  - For diagnostic procedures, as a single dose 5–10 minutes before examination, 10–20 mg (10 mg in young adults 15–19 years); **CHILD** under 3 years 1 mg, 5–9 years 2 mg, 5–9 years 2.5 mg, 9–14 years 5 mg

**Metoclopramide**

- **Non-proprietary**
  - Tablets, metoclopramide hydrochloride 10 mg, net price 28-tab pack = £1.01
  - **Oral solution**, metoclopramide hydrochloride 5 mg/5 mL, net price 150-mL pack = £6.51
  - Counselling, use of pipette
  - **Injection**, metoclopramide hydrochloride 5 mg/mL, net price 2-mL amp = 26p

**Maxolon**

- **(Amdipharm)**
  - Tablets, scored, metoclopramide hydrochloride 10 mg, net price 94-tab pack = £5.24
  - **Injection**, metoclopramide hydrochloride 5 mg/mL, net price 2-mL amp = 27p

**High-dose (with cytotoxic chemotherapy only)**

**Maxolon High Dose**

- **(Amdipharm)**
  - **Injection**, metoclopramide hydrochloride 5 mg/mL, net price 20-mL amp = £2.67
  - For dilution and use as an intravenous infusion in nausea and vomiting associated with cytotoxic chemotherapy only
  - **Dose** by continuous intravenous infusion (preferred method), initially (before starting chemotherapy), 2–4 mg/kg over 15–20 minutes, then 3–5 mg/kg over 8–12 hours; max. in 24 hours, 10 mg/kg
  - By intermittent intravenous infusion, up to 2 mg/kg over at least 15 minutes then up to 2 mg/kg over at least 15 minutes every 2 hours; max. in 24 hours, 10 mg/kg
4 Central nervous system

4.6 Drugs used in nausea and vertigo

GRANISETRON

Indications see under Dose

Cautions QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval)

Pregnancy use only when compelling reasons—no information available

Breast-feeding avoid—no information available

Side-effects constipation, headache, flushing, injection site-reactions; less commonly hiccups, hypotension, bradycardia, chest pain, arthralgia, movement disorders, seizures; on intravenous administration, rarely dizziness, transient visual disturbances (very rarely transient blindness); suppositories may cause rectal irritation

Dose

● Moderately emetogenic chemotherapy or radiotherapy, ADULT over 18 years, by mouth, 8 mg 1–2 hours before treatment or by rectum, 16 mg 1–2 hours before treatment or by intramuscular injection or slow intravenous injection, 8 mg immediately before treatment then by mouth, 8 mg every 12 hours for up to 5 days or by rectum, 16 mg daily for up to 5 days

● Severely emetogenic chemotherapy, ADULT over 18 years, by intramuscular injection or slow intravenous injection, 8 mg immediately before treatment, where necessary followed by 2 further doses of 8 mg at intervals of 2–4 hours (or followed by 1 mg/hour by continuous intravenous infusion for up to 24 hours) then by mouth, 8 mg every 12 hours for up to 5 days or by rectum, 16 mg daily for up to 5 days; alternatively, by intravenous infusion over at least 15 minutes, 32 mg immediately before treatment or by rectum, 16 mg 1–2 hours before treatment then by mouth, 8 mg every 12 hours for up to 5 days or by rectum, 16 mg daily for up to 5 days

● Chemotherapy-induced nausea and vomiting, CHILD 6 months–18 years, by intravenous infusion over at least 15 minutes, 5 mg/m² (max. 8 mg) immediately before chemotherapy, then for body-surface area less than 0.6 m² 2 mg by mouth every 12 hours for up to 5 days; for body-surface area 0.6 m² or greater 4 mg by mouth every 12 hours for up to 5 days; max. total daily dose 32 mg; alternatively, by intravenous infusion over at least 15 minutes, 150 micrograms/kg (max. 8 mg) immediately before chemotherapy repeated at intervals of 4 hours for 2 further doses, then for body-weight 10 kg or less 2 mg by mouth every 12 hours for up to 5 days; for body-weight over 10 kg 4 mg by mouth every 12 hours for up to 5 days; max. total daily dose 32 mg

● Prevention of postoperative nausea and vomiting, by mouth, 16 mg 1 hour before anaesthesia or 8 mg 1 hour before anaesthesia followed by 8 mg at intervals of 8 hours for 2 further doses alternatively, by intramuscular or slow intravenous injection, 4 mg at induction of anaesthesia; CHILD 1 month–18 years, by slow intravenous injection over at least 30 seconds, 100 micrograms/kg (max. 4 mg) before, during, or after induction of anaesthesia

● Treatment of postoperative nausea and vomiting, by intramuscular or slow intravenous injection, 4 mg,
**Neurokinin receptor antagonists**

### APREPITANT

**Indications** adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**Cautions** interactions: Appendix 1 (aprepitant)

**Hepatic impairment** caution in moderate to severe impairment

**Pregnancy** avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** hiccup, dyspepsia, diarrhoea, constipation, anorexia, nausea, headache, dizziness; *less commonly* weight changes, dry mouth, colitis, flatulence, stomatitis, abdominal pain, duodenal ulcer, taste disturbance, oedema, Bradycardia, palpitations, cough, euphoria, anxiety, confusion, drowsiness, thirst, abnormal dreams, chills, hyperglycaemia, polyuria, anaemia, dysuria, haematuria, hypernatraemia, neutropenia, myalgia, conjunctivitis, pharyngitis, sneezing, tinnitus, sweating, pruritus, rash, acne, photosensitivity, and flushing; dyspnoea, insomnia, visual disturbances, dysarthria, urticaria, and Stevens-Johnson syndrome also reported

**Dose**

- **ADULT** over 18 years 125 mg 1 hour before chemotherapy, then 80 mg daily as a single dose for the next 2 days; consult product literature for dose of concomitant corticosteroid and 5HT3 antagonist

**Emend® (MSD)**

- **Capsules** aprepitant 80 mg (white), net price 2-cap pack = £31.61; 125 mg (white/pink), 5-cap pack = £79.03; 3-day pack of one 125-mg capsule and two 80-mg capsules = £47.42

### FOSAPREPITANT

**Note** Fosaprepitant is a prodrug of aprepitant

**Indications** adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**Cautions** interactions: Appendix 1 (aprepitant)

**Pregnancy** see Aprepitant

**Breast-feeding** see Aprepitant

**Side-effects** see Aprepitant

**Dose**

- **By intravenous infusion**, over 15 minutes, **ADULT** over 18 years, 115 mg 30 minutes before chemotherapy on day 1 of cycle (followed by aprepitant on days 2 and 3 of cycle); consult product literature for dose of concomitant corticosteroid and 5HT3 antagonist

**Ivemend® (MSD)**

- **Injection**, powder for reconstitution, fosaprepitant (as dimeglumine), net price 115-mg vial = £20.55

The Scottish Medicines Consortium (p. 4) has advised (September 2008) that fosaprepitant (Ivemend®) is accepted for restricted use for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.
Cannabidiol

**NABILONE**

**Indications** nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (under close observation, preferably in hospital setting)

**Cautions** history of psychiatric disorder; elderly; hypertension; heart disease; adverse effects on mental state can persist for 48–72 hours after stopping; **interactions:** Appendix 1 (nabilone)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** avoid in severe impairment

**Contra-indications**

- motion sickness; hypersalivation associated with clozapine therapy (unlicensed indication), by mouth, 300 micrograms up to 3 times daily; max. 900 micrograms daily; **CHILD** under 18 years, see *BNF for Children*

**Joy Rides®** (GSK Consumer Healthcare)

- Tablets, chewable, raspberry-flavoured, hyoscine hydrobromide 150 micrograms, net price 12-tab pack = £1.49. Label: 2, 24

**Kwells®** (Bayer Consumer Care)

- Tablets, chewable, scored, hyoscine hydrobromide 150 micrograms (Kwells® Kids) (white), net price 12-tab pack = £1.67; 300 micrograms (pink), 12-tab pack = £1.67. Label: 2

**Patches**

**Scopoderm TTS®** (Novartis Consumer Health)

- Patch, self-adhesive, pink, releasing hyoscine approx. 1 mg/72 hours when in contact with skin, net price 2 = £4.30. Label: 19, counselling, see below

**Dose** motion sickness prevention, apply 1 patch to hairless area of skin behind ear 5–6 hours before journey; replace if necessary after 72 hours, stting replacement patch behind other ear; **CHILD** under 10 years not recommended

**Counselling** Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time

**Parenteral preparations**

Section 15.1.3

Other drugs for Ménière’s disease

Betahistine has been promoted as a specific treatment for Ménière’s disease.

**BETAHISTINE DIHYDROCHLORIDE**

**Indications** vertigo, tinnitus and hearing loss associated with Ménière’s disease

**Cautions** asthma, history of peptic ulcer; **interactions:** Appendix 1 (betahistine)

**Contra-indications** phaeochromocytoma

**Pregnancy** avoid unless clearly necessary—no information available

**Breast-feeding** use only if potential benefit outweighs risk—no information available

**Side-effects** gastro-intestinal disturbances; headache, rashes and pruritus reported

**Dose**

- Initially 16 mg 3 times daily, preferably with food; maintenance 24–48 mg daily; **CHILD** not recommended

Betahistine Dihydrochloride (Non-proprietary)

- Tablets, beta histine dihydrochloride 8 mg, net price 84-tab pack = £2.15 120-tab pack = £1.76; 16 mg, 84-tab pack = £2.24. Label: 21

**Serc®** (Solvay)

- Tablets, beta histine dihydrochloride 8 mg (Serc®-8), net price 120-tab pack = £9.04; 16 mg (Serc®-16) (scored), 84-tab pack = £12.65. Label: 21
analgesics

4.7.1 Non-opioid analgesics and compound analgesic preparations

The non-opioid drugs (section 4.7.1), paracetamol and aspirin (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics (section 4.7.2) are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in palliative care For advice on pain relief in palliative care, see p. 20.

Pain in sickle-cell disease The pain of mild sickle-cell crises is managed with paracetamol, a NSAID (section 10.1.1), codeine, or dihydrocodeine. Severe crises may require the use of morphine or diamorphine; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine necessitates frequent injections.

Dental and orofacial pain Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with. Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis (dry socket) or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-ossseous injections of an analgesic for dental purposes should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine necessitates frequent injections.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzoyldine mouthwash or spray (p. 694) until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of paracetamol (p. 259) or ibuprofen (p. 636) is often helpful.

The choice of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include ibuprofen, diclofenac, and aspirin; for further details see section 4.7.1 and section 10.1.1. Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics (section 4.7.2) such as dihydrocodeine act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam (section 4.1.2), which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin (section 4.7.1) or ibuprofen (section 10.1.1) may also be required.

For the management of neuropathic pain, persistent idiopathic facial pain, and trigeminal neuralgia, see section 4.7.3.

Dysmenorrhoea Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol or a NSAID (section 10.1.1) will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate, section 1.2) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antplatelet properties (section 2.9). Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly. Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin is a special hazard, see interactions: Appendix 1 (aspirin).

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irri- tant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. Over-
4.7.1 Non-opioid analgesics and compound analgesic preparations

**dosage** with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days (see Emergency Treatment of Poisoning, p. 34).

**Nefopam** may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

**Non-steroidal anti-inflammatory analgesics** (NSAIDs, section 10.1.1) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly (see also p. 25). They are also suitable for the relief of pain in *dysmenorrhoea* and to treat pain caused by *secondary bone tumours*, many of which produce lysis of bone and release prostaglandins (see Prescribing in Palliative Care, p. 20). Selective inhibitors of cyclo-oxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. NSAIDs including ketorolac are also used for peri-operative analgesia (section 15.1.4.2).

A non-opioid analgesic administered by intrathecal infusion (*ziconotide* (Prialt™), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

**Dental and orofacial pain** Most dental pain is relieved effectively by NSAIDs (section 10.1.1). **Aspirin** (below) is effective against mild to moderate dental pain; dispersible tablets provide a rapidly absorbed form of aspirin suitable for most purposes.

The analgesic effect of paracetamol in mild to moderate dental pain is probably less than that of aspirin, but it does not affect bleeding time or interact significantly with warfarin. Moreover, it is less irritant to the stomach. Paracetamol is a suitable analgesic for children; sugar-free versions can be requested by specifying 'sugar-free' on the prescription.

For further information on the management of dental and orofacial pain, see p. 257.

**Compound analgesic preparations**

Compound analgesic preparations that contain a simple analgesic (such as aspirin or paracetamol) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol or aspirin with a **low dose** of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of **over-dosage** (see p. 36) yet may not provide significant additional relief of pain.

A **full dose** of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration). For details of the **side-effects** of opioid analgesics, see p. 262 (**important**: the elderly are particularly susceptible to opioid side-effects and should receive lower doses).

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

For information on the use of combination analgesic preparations in dental and orofacial pain, see p. 257.

**Caffeine** is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

**Co-proxamol** tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets [unlicensed] may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

**ASPIRIN** (Acetylsalicylic Acid)

**Indications** mild to moderate pain, pyrexia; anti-platelet (section 2.9)

**Cautions** asthma, allergic disease, dehydration; preferably avoid during fever or viral infection in children (risk of Reye’s syndrome, see below); elderly, G6PD-deficiency (section 9.1.5); concomitant use of drugs that increase risk of bleeding; **interactions**: Appendix 1 (aspirin)

**Contra-indications** children under 16 years (Reye’s syndrome, see below); previous or active peptic ulceration, haemophilia; not for treatment of gout

**Hypersensitivity** Aspirin and other NSAIDs are contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angio-oedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID

**Reye’s syndrome** Owing to an association with Reye’s syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki syndrome

**Hepatic impairment** avoid in severe impairment—increased risk of gastro-intestinal bleeding

**Renal impairment** use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding

**Pregnancy** impaired platelet function with risk of haemorrhage, and delayed onset and increased duration of labour with increased blood loss, can occur if used during delivery; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); with high doses, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus in jaundiced neonates

**Breast-feeding** avoid—possible risk of Reye’s syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low

**Side-effects** generally mild and infrequent but high incidence of gastro-intestinal irritation with slight asymptomatic blood loss, increased bleeding time,
bronchospasm and skin reactions in hypersensitive patients. Prolonged administration, see section 10.1.1.

**Overdose:** see Emergency Treatment of Poisoning, p. 34

### Dose
- **By mouth,** 300–900 mg every 4–6 hours when necessary; max. 4 g daily; **CHILD** under 16 years not recommended (see Raye’s Syndrome, above).
- **By rectum,** 450–900 mg every 4 hours (max. 3.6 g daily); **CHILD** under 16 years not recommended (see Raye’s Syndrome, above).

#### Aspirin (Non-proprietary)
- **Tablets** (R), aspirin 300 mg, net price 32-tab pack = 31p. Label: 21, 32
- **Tablets** (R), e/c, aspirin 300 mg, net price 100-tab pack = £5.29; 75 mg, see section 2.9. Label: 25, 25, 32
- **Dispersible tablets** (R), aspirin 300 mg, net price 100-tab pack = £2.88; 75 mg, see section 2.9.
- Label: 13, 21, 32

#### Nu-Seals® (Aspirin) (Alliance)
- **Tablets** (R), e/c, aspirin 300 mg, net price 100-tab pack = £4.15; 75 mg, see section 2.9. Label: 5, 25, 32

#### With codeine phosphate 8 mg

- **Co-codaprin (Non-proprietary)**
  - **Dispersible tablets,** co-codaprin 8/400 (codeine phosphate 8 mg, aspirin 400 mg), net price 100-tab pack = £35.22. Label: 21, 25, 32
  - **Dose** 1–2 tablets in water every 4–6 hours; max. 8 tablets daily
  - When co-codaprin tablets or dispersible tablets are prescribed and no strength is stated, tablets or dispersible tablets, respectively, containing codeine phosphate 8 mg and aspirin 400 mg should be dispensed

#### With metoclopramide

For prescribing information on metoclopramide, see section 4.6

#### MigraMax® (Cephalon) (R)
- **Oral powder,** aspirin (as lysine acetylsalicylate) 900 mg, metoclopramide hydrochloride 10 mg/sachet, net price 6-sachet pack = £6.60, 20-sachet pack = £21.99. Label: 21, 25, 32
- **Dose** acute migraine, **ADULT** over 20 years 1 sachet in water at onset of attack, repeated after 2 hours if necessary (max. 3 sachets in 24 hours); **YOUNG ADULT** (under 20 years) and **CHILD** not recommended

**Important** Metoclopramide can cause severe extrapyramidal effects, particularly in children and young adults (for further details, see p. 249)

**Excipients** include aspartame (section 9.4.1)

---

1. Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances; for details see Medicines, Ethics and Practice, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available)

2. Can be sold to the public in certain circumstances; for exemptions see Medicines, Ethics and Practice, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available)
### Co-codamol 15/500
When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed (see preparations above).

See warnings and notes on p. 258 (important: special care in elderly—reduce dose).

### Co-codamol 30/500
When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed (see preparations above).

See warnings and notes on p. 258 (important: special care in elderly—reduce dose).

---

#### Paediatric soluble tablets
(= Paediatric dispersible tablets), paracetamol 120 mg, net price 16-tab pack = 89p; Label: 13, 30

**Brands include** Diapro® Soluble Paracetamol (AU)

**Oral suspension** 120 mg/5 mL (= Paediatric Mixtures), paracetamol 120 mg/5 mL, net price 100 mL = 72p, 150 mL = 84p, 200 mL = £1.05, 500 mL = £1.94.

**Label:** 30

**Note** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixtue is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed; sugar-free versions can be ordered by specifying ‘sugar-free’ on the prescription.

**Brands include** Calpol® Paediatric, Calpol® Paediatric sugar-free, Diapro® Paediatric, Medinol® Paediatric sugar-free, Parano® sugar-free

**Oral suspension** 250 mg/5 mL (= Mixture), paracetamol 250 mg/5 mL, net price 100 mL = 82p, 200 mL = £1.10, 500 mL = £3.28. Label: 30

**Brands include** Calpol® Plus (AU), Medinol® Over 6 (AU)

**Note** Other strengths available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

#### Panadol OA® (GSK) (AU)
Tablets, f/c, paracetamol 1 g, net price 100-tab pack = £3.80. Label: 30

**Dose**

- **ADULT** and **CHILD** over 12 years, 1 tablet up to 4 times daily, not more often than every 4 hours

**Perfalgan® (Bristol-Myers Squibb) (AU)**

**Intravenous infusion** paracetamol 10 mg/mL, net price 50-mL vial = £1.39, 100-mL vial = £1.52

#### Co-codamol 8/500
When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

**Co-codamol 8/500 (Non-proprietary) (AU)**

**Tablets**, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg), net price 10-tab pack = £1.15, 20-tab pack = £3.55. Label: 29, 30

**Dose**

- 1–2 tablets every 4–6 hours; max. 8 tablets daily
- CHILD 6–12 years ½–1 tablet, max. 4 tablets daily

**Effervescent or dispersible tablets**, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg), net price 32-tab pack = £1.50, 100-tab pack = £4.32. Label: 13, 29, 30

**Brands include** Paracodene®

**Note** The Drug Tariff allows tablets of co-codamol labelled ‘dispersible’ to be dispensed against an order for ‘effervescent’ and vice versa

**Dose**

- 1–2 tablets in water every 4–6 hours, max. 8 tablets daily; CHILD 6–12 years ½–1 tablet, max. 4 tablets daily

**Capsules**, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg), net price 10-cap pack = £1.10, 20-cap pack = £1.71. Label: 29, 30

**Brands include** Paracodene®

**Dose**

- 1–2 capsules every 4 hours; max. 8 capsules daily

1. Can be sold to the public in certain circumstances; for exemptions see Medicines, Ethics and Practice, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available)
BNF 61

4.7.1 Non-opioid analgesics and compound analgesic preparations 261

Solpadol® (Sanofi-Aventis) *(CM)*

Caplets (= tablets), co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £6.74. Label: 2, 29, 30

Dose 2 tablets every 4 hours; max. 8 tablets daily; CHILD under 12 years not recommended

Capsules, grey/purple, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-cap pack = £6.74. Label: 2, 29, 30

Dose 2 capsules every 4 hours; max. 8 capsules daily; CHILD under 12 years not recommended

Effervescent tablets, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 32-tab pack = £2.59, 100-tab pack = £8.09. Label: 2, 13, 29, 30

Electrolytes Na⁺ 16.9 mmol/tablet

Dose 2 tablets in every 4 hours; max. 8 tablets daily. CHILD under 12 years not recommended

Tylex® (UCB Pharma) *(CM)*

Capsules, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-cap pack = £7.70. Label: 2, 29, 30

Dose 1–2 capsules every 4 hours; max. 8 capsules daily; CHILD under 12 years not recommended

Effervescent tablets, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £8.80. Label: 2, 13, 29, 30

Electrolytes Na⁺ 14.2 mmol/tablet

Dose 1–2 tablets in water every 4 hours; max. 8 tablets daily; CHILD under 12 years not recommended

With methionine (co-methiamol)

A mixture of methionine and paracetamol; methionine has no analgesic activity but may prevent paracetamol-induced liver toxicity if overdose taken

Paradote® (Pernot)

Tablets, f/c, co-methiamol 100/500 (ox-methionine 100 mg, paracetamol 500 mg), net price 24-tab pack = £1.05, 96-tab pack = £2.77. Label: 29, 30

Dose 2 tablets every 4 hours; max. 8 tablets daily; CHILD under 12 years not recommended

With dihydrocodeine tartrate 10 mg

See notes on p. 258

When co-dydramol tablets are prescribed and no strength is stated, tablets containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg should be dispensed

Co-dydramol (Non-proprietary) *(CM)*

Tablets, scored, co-dydramol 10/500 (dihydrocodeine tartrate 10 mg and paracetamol 500 mg) should be dispensed

Dose 1–2 tablets every 4–6 hours; max. 8 tablets daily; CHILD under 12 years not recommended

With dihydrocodeine tartrate 20 or 30 mg

See warnings and notes on p. 258 (important: special care in elderly—reduce dose)

When co-dydramol tablets are prescribed and no strength is stated, tablets containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg should be dispensed

Remedeine® (Napp) *(CM)*

Tablets, paracetamol 500 mg, dihydrocodeine tartrate 20 mg, net price 112-tab pack = £10.57. Label: 2, 29, 30

Dose 1–2 tablets every 4–6 hours; max. 8 tablets daily; CHILD under 12 years not recommended

Forté tablets, paracetamol 500 mg, dihydrocodeine tartrate 30 mg, net price 56-tab pack = £6.53. Label: 2, 29, 30

Dose 1–2 tablets every 4–6 hours; max. 8 tablets daily; CHILD under 12 years not recommended

With isometheptene mucate

Isometheptene mucate (in combination with paracetamol) is licensed for the treatment of acute attacks of migraine; other more effective treatments are available.

Midrid® (Mann) *(CM)*

Tablets, red, isometheptene mucate 65 mg, paracetamol 325 mg, net price 30-cap pack = £5.50. Label: 30, counselling, dosage

Dose 1 migraine, 2 capsules at onset of attack, followed by 1 capsule every hour if necessary. max. 5 capsules in 12 hours; CHILD not recommended

1. A pack containing 15 capsules may be sold to the public

With tramadol

For prescribing information on tramadol, see section 4.7.2

Tramacet® (Grunenthal) *(CM)*

Tablets, f/c, yellow, tramadol hydrochloride 37.5 mg, paracetamol 325 mg, net price 60-tab pack = £9.68. Label: 2, 25, 29, 30

Dose 2 tablets not more often than every 6 hours; max. 8 tablets daily. CHILD under 12 years not recommended

Effervescent tablets, pink, tramadol hydrochloride 37.5 mg, paracetamol 325 mg, net price 60-tab pack = £9.68. Label: 2, 13, 29, 30

Electrolytes Na⁺ 7.8 mmol/tablet

Dose 2 tablets not more often than every 6 hours; max. 8 tablets daily; CHILD under 12 years not recommended

With antiemetics

Migraleve® (McNeil)

Tablets, f/c, pink tablets, buclizine hydrochloride 6.25 mg, paracetamol 500 mg, codeine phosphate 8 mg; yellow tablets, paracetamol 500 mg, codeine phosphate 8 mg, net price 48-tab pack Migraleve (32 pink + 16 yellow) = £4.81; 48 pink (Migraleve Pink) = £5.24; 48 yellow (Migraleve Yellow) = £4.70. Label: 2, (Migraleve Pink), 17, 30

Dose acute migraine, 2 pink tablets at onset of attack, followed by 2 yellow tablets every 4 hours if necessary. max. 2 pink and 6 yellow in 24 hours; CHILD under 10 years, only under close medical supervision; 10–14 years, half adult dose

Paramax® (Sanofi-Aventis) *(CM)*

Tablets, scored, paracetamol 500 mg, metoclopramide hydrochloride 5 mg, net price 42-tab pack = £9.64. Label: 17, 30

Sachets, effervescent powder, sugar-free, the contents of 1 sachet = 1 tablet; to be dissolved in ¼ tumblerful of liquid before administration, net price 42-sachet pack = £12.52. Label: 13, 17, 30

Dose acute migraine, (tablets or sachets): 2 at onset of attack then every 4 hours when necessary to max. of 6 in 24 hours; YOUNG ADULT 12–19 years, 1 at onset of attack then 1 every 4 hours when necessary to max. of 3 in 24 hours (max. dose of metoclopramide 500 micrograms/kg daily)

Important Metoclopramide can cause severe extrapyramidal effects, particularly in children and young adults (for further details, see p. 249)

**NEFOPAM HYDROCHLORIDE**

4.7.7 Opioid analgesics

Opioid analgesics are usually used to relieve moderate
to severe pain particularly of visceral origin. Repeated
administration may cause dependence and tolerance,
but this is no deterrent in the control of pain in terminal
illness, for guidelines see Prescribing in Palliative Care,
p. 20. Regular use of a potent opioid may be appropriate for
certain cases of chronic non-malignant pain; treat-
ment should be supervised by a specialist and the
patient should be assessed at regular intervals.

Cautions

Opioids should be used with caution in patients with impaired respiratory function (avoid in chronic obstructive pulmonary disease) and asthma (avoid during an acute attack), hypotension, shock, myasthenia gravis, prostatic hypertrophy, obstructive or inflammatory bowel disorders, diseases of the biliary tract, and convulsive disorders. A reduced dose is recommended in elderly or debilitated patients, in hypo-
throidism, and in adrenocortical insufficiency. Repeated use of opioid analgesics is associated with the development of psychological and physical depend-
ence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence. Avoid abrupt withdrawal after long-term treatment. Transdermal preparations (fentanyl or buprenorphine patches) are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the
dose. Interactions: Appendix 1 (opioid analgesics; important: special hazard with pethidine and possibly other opioids and MAOIs).

Palliative care In the control of pain in terminal illness, the

cautions listed above should not necessarily be a deterrent to the use of opioid analgesics.

Contra-indications

Opioid analgesics should be avoided in patients with acute respiratory depression and when there is a risk of paralytic ileus. They are also contra-indicated in conditions associated with raised intracranial pressure and in head injury (opioid analgesics interfere with papillary responses vital for neu-
rological assessment). Comatose patients should not be treated with opioid analgesics.

Hepatic impairment

Opioid analgesics may precipi-
tate coma in patients with hepatic impairment; avoid
use or reduce dose.

Renal impairment

The effects of opioid analgesia are increased and prolonged and there is increased cerebral

sensitivity when patients with renal impairment are treated with opioid analgesics; avoid use or reduce dose.

Pregnancy

Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

Side-effects

Opioid analgesics share many side-
effects, although qualitative and quantitative differences exist. The most common side-effects include nausea and vomiting (particularly in initial stages), constipation, dry mouth, and biliary spasm; larger doses produce muscle rigidity, hypotension, and respiratory depression (for reversal of opioid-induced respiratory depression, see section 15.1.7). Other common side-effects of opioid analgesics include bradycardia, tachycardia, palpitation, oedema, postural hypotension, hallucinations, vertigo, euphoria, dysphoria, mood changes, dependence, dizzi-

ness, confusion, drowsiness, sleep disturbances, head-
ache, sexual dysfunction, difficulty with micturition, urinary retention, ureteric spasm, miosis, visual distur-
bances, sweating, flushing, rash, urticaria, and pruritus.

Overdose: see Emergency Treatment of Poisoning, p. 36.

Long-term use of opioid analgesics can cause hypo-

gonadism and adrenal insufficiency in both men and women. This can lead to amenorrhoea, reduced libido, infertility, depression, and erectile dysfunction. Long-
term use of opioid analgesics has been associated with a state of abnormal pain sensitivity (hyperalgesia). Pain associated with hyperalgesia is usually qualitatively dis-
tinct from pain associated with disease progression or breakthrough pain, and is often more diffuse and less defined. Treatment of hyperalgesia involves reducing the dose of opioid medication or switching therapy; cases of suspected hyperalgesia should be referred to a specialist pain team.

Driving

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

Strong opioids

Morphine remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in palliative care. It is given regularly every 4 hours (or every 12 or 24 hours as modified-
release preparations). For guidelines on dosage adjust-
ment in palliative care, see p. 20.

A modified-release epidural preparation of morphine is available from Flynn Pharma Ltd (Depodur®).

Buprenorphine has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of bupren-

orphine are only partially reversed by naloxone.
Dipipanone used alone is less sedating than morphine but the only preparation available contains an anti-emetic and is therefore not suitable for regular regimens in palliative care.

Diamorphine (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In palliative care the greater solubility of diamorphine allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil, fentanyl and remifentanil are used by injection for intra-operative analgesia (section 15.1.4.3); fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone is less sedating than morphine and acts for longer periods. In prolonged use, methadone should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdose. Methadone may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of pain in palliative care.

Papaveretum is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine or codeine, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine, are often preferred for obstetric pain.

Pentazocine produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine, are often preferred for obstetric pain.

Tramadol produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Weak opioids Codeine is used for the relief of mild to moderate pain but is too constipating for long-term use.

Dihydrocodeine has an analgesic efficacy similar to that of codeine. The dose of dihydrocodeine by mouth is usually 30 mg every 4 hours; doubling the dose to 60 mg may provide some additional pain relief but this may be at the cost of more nausea and vomiting. A 40-mg tablet is also available.

Meptazinol is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

Dose The dose of opioids in the BNF may need to be adjusted individually according to the degree of analgesia and side-effects; patients’ response to opioids varies widely.

Postoperative analgesia A combination of opioid and non-opioid analgesics (section 4.7.1 and section 15.1.4.2) is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of post-operative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression (for the treatment of opioid-induced respiratory depression, see section 15.1.7).

Morphine is used most widely. Tramadol is not as effective in severe pain as other opioid analgesics. Buprenorphine may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

For details of patient-controlled analgesia (PCA) to relieve postoperative pain, consult hospital protocols. Formulations specifically designed for PCA are available (Pharma-Ject® Morphine Sulphate).

Dental and orofacial pain Opioid analgesics are relatively ineffective in dental pain. Like other opioids, dihydrocodeine often causes nausea and vomiting which limits its value in dental pain; if taken for more than a few doses it is also liable to cause constipation. Dihydrocodeine is not very effective in postoperative dental pain.

For the management of dental and orofacial pain, see p. 257.

Pain management and opioid dependence Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special license to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

**BUPRENORPHINE**

**Indications** see under Dose and under Patches; opioid dependence (section 4.10.3)

**Caution** see notes above; also impaired consciousness; effects only partially reversed by naloxone

**Fever or external heat** Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above and section 4.10.3

**Breast-feeding** avoid unless essential—may inhibit lactation; see also section 4.10.3

**Side-effects** see notes above; can induce mild withdrawal symptoms in patients dependent on opioids; also diarrhoea, abdominal pain, anorexia, dyspepsia; vasodilatation; dyspnoea; paraesthesia, asthenia, fatigue, agitation, anxiety; less commonly flatulence, taste disturbance, angina, hypertension, syncope,
hypoxia, wheezing, cough, restlessness, depersonalisation, dysarthria, impaired memory, hypoaesthesia, tremor, influenza-like symptoms, pyrexia, rhinitis, rigors, muscle cramp, myalgia, tinnitus, dry skin, and dry skin; rarely paralytic ileus, dysphagia, impaired concentration, and psychosis; very rarely retching, hyperventilation, hiccup, and muscle fasciculation.

**Dose**

- Moderate to severe pain, by sublingual administration:
  - 200–400 micrograms every 6–8 hours; **CHILD** over 6 years, 16–25 kg, 100 micrograms every 6–8 hours; 25–37.5 kg, 100–200 micrograms every 6–8 hours; 37.5–50 kg, 200–300 micrograms every 6–8 hours

**By intramuscular or slow intravenous injection, 300–600 micrograms every 6–8 hours; **CHILD** over 6 months 3–6 micrograms/kg every 6–8 hours (max. 9 micrograms/kg).

- Premedication, by sublingual administration, 400 micrograms

**By intramuscular injection, 300 micrograms

- Intra-operative analgesia, by slow intravenous injection, 300–450 micrograms

**Temgesic** (Reckitt Benckiser) 

**Tablets** (sublingual), buprenorphine (as hydrochloride), 200 micrograms, net price 50-tab pack = £5.13; 400 micrograms, 50-tab pack = £10.26. Label: 2, 26

**Injection**, buprenorphine (as hydrochloride) 300 micrograms/mL, net price 1-mL amp = 48p

**Patches**

**BuTrans** (Napp) 

- **Patches**, self-adhesive, beige, buprenorphine, ‘5’ patch (releasing 5 micrograms/hour for 7 days), net price 4 = £17.60; ‘10’ patch (releasing 10 micrograms/hour for 7 days), 4 = £31.18; ‘20’ patch (releasing 20 micrograms/hour for 7 days), 4 = £57.16. Label: 2

**Dose moderate, moderate-malignant pain unresponsive to non-opioid analgesics, ADULT over 18 years, apply to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks)

**Dose adjustment** When starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Max. 2 patches can be used at any one time. For breakthrough pain, consider 200–400 micrograms buprenorphine sublingually.

**Important:** it may take approx. 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**Long duration of action** in view of the long duration of action, patients who have severe side-effects should be monitored for up to 30 hours after removing patch.

### CODEINE PHOSPHATE

**Indications** mild to moderate pain; diarrhoea (section 1.4.2); cough suppression (section 3.9.1)

**Cautions** see notes above; also cardiac arrhythmias; acute abdomen; gallstones

**Variation in metabolism** The capacity to metabolise codeine can vary considerably and lead to either reduced therapeutic effect or marked increase in side-effects

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** amount usually too small to be harmful; however mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant

**Side-effects** see notes above; also abdominal pain, anorexia, seizures, malaise, hypothermia, and muscle fasciculation; pancreatitis also reported

**Dose**

- By mouth, 30–60 mg every 4 hours when necessary, to a max. of 240 mg daily; **CHILD** 1–12 years, 3 mg/kg daily in divided doses

- By intramuscular injection, 30–60 mg every 4 hours when necessary

**Codeine Phosphate** (Non-proprietary) 

**Tablets** (Napp), codeine phosphate 15 mg, net price 28-tab pack = £1.14; 30 mg, 28-tab pack = £1.22; 60 mg, 28-tab pack = £1.84. Label: 2

**Syrup** (Napp), codeine phosphate 25 mg/5 mL, net price 100 mL = 93p. Label: 2

**Injection** (Napp), codeine phosphate 60 mg/mL, net price 1-mL amp = £2.44

**Linctus**

Section 3.9.1

### DIAMORPHINE HYDROCHLORIDE

(Heroin Hydrochloride)

**Indications** see under Dose

**Cautions** see notes above; also severe diarrhoea; toxic psychosis, CNS depression; severe cor pulmonale

**Contra-indications** see notes above; also delayed gastric emptying; phaeochromocytoma

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.
Side-effects see notes above; also anorexia, taste disturbance; syncope; ashenia, raised intracranial pressure; myocardial infarction also reported.

Dose
- Acute pain, by subcutaneous or intramuscular injection, 5 mg repeated every 4 hours if necessary (up to 10 mg for heavier well-muscled patients); by slow intravenous injection, quarter to half corresponding intramuscular dose.
- Myocardial infarction, by slow intravenous injection (1–2 mg/minute), 5 mg followed by a further 2.5–5 mg if necessary; elderly or frail patients, reduce dose by half.
- Acute pulmonary oedema, by slow intravenous injection (1 mg/minute) 2.5–5 mg.
- Chronic pain, by mouth or by subcutaneous or intramuscular injection, 5–10 mg regularly every 4 hours; dose may be increased according to needs; intramuscular dose should be approx. half corresponding oral dose, and approx. one third corresponding oral morphine dose—see also Prescribing in Palliative Care, p. 20; by subcutaneous infusion (using syringe driver), see Prescribing in Palliative Care, p. 23.

Diamorphine (Non-proprietary) (a)
- Tablets, diamorphine hydrochloride 10 mg, net price 100-tab pack = £16.62. Label: 2.
- Injection, powder for reconstitution, diamorphine hydrochloride, net price 5-mg amp = £2.57, 10-mg amp = £3.59, 30-mg amp = £3.82, 100-mg amp = £9.34, 500-mg amp = £42.07.

Dihydrocodeine Tartrate

Indications moderate to severe pain.

Cautions see notes above; also pancreatitis; severe cor pulmonale.

Contra-indications see notes above.

Hepatic impairment see notes above.

Renal impairment see notes above.

Pregnancy see notes above.

Breast-feeding use only if potential benefit outweighs risk.

Side-effects see notes above; also paralytic ileus, abdominal pain, and parasthesia.

Dose
- By mouth, 30 mg every 4–6 hours when necessary (see also notes above); CHILD over 4 years 0.5–1 mg/kg every 4–6 hours.
- By deep subcutaneous or intramuscular injection, up to 50 mg repeated every 4–6 hours if necessary; CHILD over 4 years 0.5–1 mg/kg every 4–6 hours.

Dihydrocodeine (Non-proprietary)
- Dental prescribing on NHS Dihydrocodeine Tablets 30 mg may be prescribed.
- Oral solution, dihydrocodeine tartrate 10 mg/5 mL, net price 150 mL = £3.50. Label: 2.
- Injection, dihydrocodeine tartrate 50 mg/mL, net price 1-mL amp = £3.17.

DF118 Forte (Martindale) (a)
- Tablets, dihydrocodeine tartrate 40 mg, net price 100-tab pack = £11.51. Label: 2.
- Dose ADULT and CHILD over 12 years, severe pain, 40–80 mg 3 times daily; max. 240 mg daily.

Modified release

DHC Continus® (Napp) (a)
- Tablets, m/r, dihydrocodeine tartrate 60 mg, net price 56-tab pack = £5.18; 90 mg, 56-tab pack = £8.66; 120 mg, 56-tab pack = £10.89. Label: 2, 25.
- Dose ADULT and CHILD over 12 years, chronic severe pain, 60–120 mg every 12 hours.

Dipipanone Hydrochloride

Indications moderate to severe pain.

Cautions see notes above; also diabetes mellitus; phaeochromocytoma.

Contra-indications see notes above.

Hepatic impairment see notes above.

Renal impairment see notes above.

Pregnancy see notes above.

Breast-feeding no information available.

Side-effects see notes above; also psychosis, restlessness, raised intracranial pressure.

Dose
- See preparation below.

Diconal® (Amdipharm) (a)
- Tablets, pink, scored, dipipanone hydrochloride 10 mg, cyclizine hydrochloride 30 mg, net price 50-tab pack = £9.57. Label: 2.
- Dose acute pain, 1 tablet gradually increased to 3 tablets every 6 hours; CHILD not recommended.

Caution Not recommended in palliative care, see Nausea and Vomiting, p. 22.

Fentanyl

Indications severe chronic pain, breakthrough pain; parenteral indications (section 15.1.4.3).

Cautions see notes above; also diabetes mellitus, impaired consciousness, cerebral tumour; see also Transdermal Fentanyl, p. 267.

Contra-indications see notes above.

Hepatic impairment see notes above.

Renal impairment see notes above.

Pregnancy see notes above.

Breast-feeding monitor infant for opioid-induced side-effects.

Side-effects see notes above; also abdominal pain, anorexia, dyspepsia, dysphagia, mouth ulceration, taste disturbance, stomatitis, dry mouth; vasodilatation; anopia; anxiety; myoclonus; less commonly flatulence, diarrhoea, laryngospasm, dyspnoea, hypoventilation, depersonalisation, dysarthria, amnesia, incoordination, paraesthesia, malaise, agitation, tremor, thirst and muscle weakness; rarely hiccups and arrhythmia; very rarely paralytic ileus, haemoptysis, psychosis, and seizures; shock, astyole, pyrexia, ataxia, and muscle fasciculation also reported; with nasal spray throat irritation, epistaxis, nasal ulcer, rhinorrhoea.

Dose
- Chronic intractable pain, by transdermal route, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the...
same area for several days). ADULT over 16 years not currently treated with a strong opioid analgesic (but see Transdermal Fentanyl, p. 267), initial dose, one ‘12’ or ‘25 micrograms/hour’ patch replaced after 72 hours; ADULT and CHILD over 2 years currently treated with a strong opioid analgesic, initial dose based on previous 24-hour opioid requirement (consult product literature).

**Dose adjustment** When starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application; if necessary dose should be adjusted at 48–72-hour intervals in steps of 12–25 micrograms/hour. More than one patch may be used at a time for doses greater than 100 micrograms/hour (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it may take up to 25 hours for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually).

**Long duration of action** In view of the long duration of action, patients who have had severe side-effects should be monitored for up to 24 hours after patch removal.

- **Breakthrough pain, see under oral preparations**
- **Conversion** (from oral morphine to transdermal fentanyl) see.

266 4.7.2 Opioid analgesics BNF 61

**£49.99, 30-tab pack = £149.70; 400 micrograms, 10-tab pack = £49.99, 30-tab pack = £139.72; 200 micrograms, 30-tab pack = £149.70; 600 micrograms, 30-tab pack = £149.70; 800 micrograms, 30-tab pack = £149.70; 1.2 mg, 3 = £17.52, 30 = £175.16; 1.6 mg, 3 = £17.52, 30 = £175.16. Label: 2.

**Dose** breakthrough pain in patients receiving opioid therapy for chronic cancer pain, initially 200 micrograms (over 15 minutes) repeated if necessary 15 minutes after first dose (no more than 2 dose units for each pain episode); adjust dose according to response; max. 4 dose units daily.

**Note** If more than 4 episodes of breakthrough pain each day, adjust background analgesia.

### Lozenges

**Actiq®** (Fylnon) (C)

Lozenge (buccal), with oromucosal applicator, fentanyl (as citrate) 200 micrograms, net price 3 = £17.52, 30 = £175.16; 400 micrograms, 3 = £17.52, 30 = £175.16; 600 micrograms, 3 = £17.52, 30 = £175.16; 1.2 mg, 3 = £17.52, 30 = £175.16; 1.6 mg, 3 = £17.52, 30 = £175.16. Label: 2.

**Dose** breakthrough pain in patients receiving opioid therapy for chronic cancer pain, initially 200 micrograms (over 15 minutes) repeated if necessary 15 minutes after first dose (no more than 2 dose units for each pain episode); adjust dose according to response; max. 4 dose units daily.

**Note** If more than 4 episodes of breakthrough pain each day, adjust background analgesia.

### Nasal spray

**Instanyl®** (Nycosrned) (E)

Nasal spray, fentanyl (as citrate) 50 micrograms/metered spray, net price 10-dose pack = £59.50, 20-dose pack = £119.00; 100 micrograms/metered spray, 10-dose pack = £59.50, 20-dose pack = £119.00; 200 micrograms/metered spray, 10-dose pack = £59.50, 20-dose pack = £119.00. Label: 2, counselling, administration.

**Dose** breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 50 micrograms into one nostril, repeated once if necessary after 10 minutes; adjust dose according to response; max. 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode.

**Note** If more than 4 breakthrough pain episodes daily, adjust background analgesia.

**Counselling** Patient should sit or stand during administration. Avoid concomitant use of other nasal preparations.

The Scottish Medicines Consortium (p. 4) has advised that Instanyl® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**ScrFent®** (Archimecnes) (E)

Nasal spray, fentanyl (as citrate) 100 micrograms/metered spray. net price 8-dose pack = £30.40, 32-dose pack = £121.60; 400 micrograms/metered spray, 8-dose pack = £50.30, 32-dose pack = £212.60. Label: 2, counselling, administration.

**Dose** breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 100 micrograms into one nostril, adjust dose according to response; max. 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode.

**Note** If more than 4 breakthrough pain episodes daily, adjust background analgesia.

**Counselling** Avoid concomitant use of other nasal preparations.

### Patches

**Prescriptions** Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write ‘Fentanyl 25 patches’ to preSCRIBE patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. ‘one patch to be applied every 72 hours’. The total quantity of patches to be supplied should be written in words and figures.

The Scottish Medicines Consortium (p. 4) has advised that Effentora® buccal tablets should be restricted for the manage-
Transdermal fentanyl
Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible). Avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

Respiratory depression Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.

Counselling Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdose. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.

Fentanyl (Non-proprietary)

Patches self-adhesive, fentanyl. ‘12’ patch (releasing approx. 12 micrograms/hour for 72 hours), net price 5 = £17.76; ‘25’ patch (releasing approx. 25 micrograms/hour for 72 hours), 5 = £25.38; ‘50’ patch (releasing approx. 50 micrograms/hour for 72 hours), 5 = £47.40; ‘75’ patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £66.08; ‘100’ patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £81.45. Label: 2, counselling, administration.

Brands include Fentanyl®, Matriven®, Mezolan®, Oramani®, Tilby®, Victrela®.

Durogesic DiTrans® (Janssen-Cilag) Patches self-adhesive, transparent, fentanyl. ‘12’ patch (releasing approx. 12 micrograms/hour for 72 hours), net price 5 = £17.76; ‘25’ patch (releasing approx. 25 micrograms/hour for 72 hours), 5 = £25.38; ‘50’ patch (releasing approx. 50 micrograms/hour for 72 hours), 5 = £47.40; ‘75’ patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £66.08; ‘100’ patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £81.45. Label: 2, counselling, administration.

HYDROMORPHONE HYDROCHLORIDE

Indications severe pain in cancer.

Cautions see notes above; also pancreatitis; toxic psychosis.

Contra-indications see notes above; also acute abdomen.

Hepatic impairment see notes above.

Renal impairment see notes above.

Pregnancy see notes above.

Breast-feeding avoid — no information available.

Side-effects see notes above; also paralytic ileus, peripheral oedema, seizures, asthma, dyskinesia, agitation, and tremor.

Dose see under preparations below.

Palladone® (Napp)

Capsules, hydromorphone hydrochloride 1.3 mg (orange/clear), net price 56-cap pack = £8.82; 2.6 mg (red/clear), 56-cap pack = £17.64. Label: 2, counselling. see below.

Dose 1.3 mg every 4 hours, increased if necessary according to severity of pain. CHILD under 12 years not recommended.

Counselling Swallow whole or open capsule and sprinkle contents on soft food.

Modiﬁed release

Palladone® SR (Napp)

Capsules, m/r, hydromorphone hydrochloride 2 mg (yellow/clear), net price 56-cap pack = £20.98; 4 mg (pale blue/clear), 56-cap pack = £28.75; 8 mg (pink/clear), 56-cap pack = £56.08; 16 mg (brown/clear), 56-cap pack = £106.53; 24 mg (dark blue/clear), 56-cap pack = £159.82. Label: 2, counselling, see below.

Dose 4 mg every 12 hours, increased if necessary according to severity of pain. CHILD under 12 years not recommended.

Counselling Swallow whole or open capsule and sprinkle contents on soft food.

MEPTAZINOL

Indications moderate to severe pain, including post-operative and obstetric pain and renal colic; peri-operative analgesia, section 15.1.4.3.

Cautions see notes above; effects only partially reversed by naloxone.

Contra-indications see notes above; also myocardial infarction; phaeochromocytoma.

Hepatic impairment see notes above.

Renal impairment see notes above.

Pregnancy see notes above.

Breast-feeding use only if potential benefit outweighs risk.

Side-effects see notes above; can induce withdrawal symptoms in patients dependent on opioids; also diarrhoea, abdominal pain, dyspepsia, and hypothermia.

Dose see below.

Meptid® (Almirall): Tablets, orange, 1/2, meptazinol 200 mg, net price 112-tab pack = £22.11. Label: 2.

Injection, meptazinol 100 mg (as hydrochloride)/mL, net price 1-mL amp = £1.92.

METHADONE HYDROCHLORIDE

Indications severe pain, see notes above; cough in terminal disease (section 3.9.1); adjunct in treatment of opioid dependence (section 4.10.3).

Cautions see notes above; also history of cardiac conduction abnormalities, family history of sudden death (ECG monitoring recommended; see also QT Interval Prolongation, below).

QT interval prolongation Patients with the following risk factors for QT interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

Contra-indications see notes above; also phaeochromocytoma.

Hepatic impairment see notes above.

Renal impairment see notes above.

Pregnancy see notes above.

Breast-feeding withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation.
4 Central nervous system

268 4.7.2 Opioid analgesics

**Side-effects** see notes above; also QT interval prolongation, tordase de pointes, hypothermia, restlessness, raised intracranial pressure, dysmenorrhoea, dry eyes, and hyperprolactinaemia

**Dose**

- **By mouth or by subcutaneous or intramuscular injection**, 5–10 mg every 6–8 hours, adjusted according to response; on prolonged use not to be given more frequently than every 12 hours; **CHILD** not recommended

**Methadone** (Non-proprietary)

**Tablets**, methadone hydrochloride 5 mg, net price 50 = £2.84. Label: 2

**Brands include:** Physeptone®

**Injection**, methadone hydrochloride, 10 mg/mL, net price 1-mL amp = £1.00, 2-mL amp = £1.67, 3.5-mL amp = £2.11, 5-mL amp = £2.28

**Brands include:** Physeptone®, Synastone®

**Notes**

- Premedication, **by subcutaneous or intramuscular injection**, up to 10 mg 60–90 minutes before operation; **CHILD**, by intramuscular injection, 150 micrograms/kg
- **Patient controlled analgesia** (PCA), consult hospital protocols
- **Myocardial infarction**, by slow intravenous injection (1–2 mg/minute), 5–10 mg followed by a further 5–10 mg if necessary; **ELDERLY** or frail patients, reduce dose by half
- **Acute pulmonary oedema**, by slow intravenous injection (2 mg/minute) 5–10 mg; **ELDERLY** or frail patients, reduce dose by half
- **Chronic pain**, by mouth or by subcutaneous injection (not suitable for oedematous patients) or by intramuscular injection, initially 5–10 mg every 4 hours, adjusted according to response; see also Prescribing in Palliative Care, p. 20
- **By rectum**, initially 15–30 mg every 4 hours, adjusted according to response

**Note**

- The doses stated above refer equally to morphine hydrochloride and sulphate

**MORPHINE SALTS**

**Indications** see notes above and under Dose; acute diarrhoea (section 1.4.2); cough in terminal care (section 3.9.1)

**Cautions** see notes above; also pancreatitis, cardiac arrhythmias, severe cor pulmonale

**Contra-indications** see notes above; also delayed gastric emptying, acute abdomen; heart failure secondary to chronic lung disease; phaeochromocytoma

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring

**Side-effects** see notes above; also paralytic ileus, dry mouth, dysmenorrhoea, dry eyes, and hyperprolactinaemia

**Dose**

- **Acute pain**, **by subcutaneous injection** (not suitable for oedematous patients) or **by intramuscular injection**, initially 10 mg (**ELDERLY** or frail) 5 mg every 4 hours (or more frequently during titration), adjusted according to response; **NEONATE** initially 100 micrograms/kg every 6 hours, adjusted according to response; **CHILD** 1–6 months initially 100 micrograms/kg every 6 hours, adjusted according to response; **CHILD** 6 months–2 years initially 100–200 micrograms/kg every 4 hours, adjusted according to response; **CHILD** 2–18 years initially 2.5–10 mg every 4 hours, adjusted according to response

- **By slow intravenous injection**, initially 5 mg (reduce dose in **ELDERLY** or frail) every 4 hours (or more frequently during titration), adjusted according to response; **NEONATE** initially 50 micrograms/kg every 6 hours, adjusted according to response; **CHILD** 1–6 months initially 100 micrograms/kg every 6 hours, adjusted according to response; **CHILD** 6 months–12 years initially 100 micrograms/kg every 4 hours, adjusted according to response

- **Premedication**, **by subcutaneous or intramuscular injection**, up to 10 mg 60–90 minutes before operation; **CHILD**, by intramuscular injection, 150 micrograms/kg
- **Patient controlled analgesia** (PCA), consult hospital protocols
- **Myocardial infarction**, by slow intravenous injection (1–2 mg/minute), 5–10 mg followed by a further 5–10 mg if necessary; **ELDERLY** or frail patients, reduce dose by half
- **Acute pulmonary oedema**, by slow intravenous injection (2 mg/minute) 5–10 mg; **ELDERLY** or frail patients, reduce dose by half
- **Chronic pain**, by mouth or by subcutaneous injection (not suitable for oedematous patients) or by intramuscular injection, initially 5–10 mg every 4 hours, adjusted according to response; see also Prescribing in Palliative Care, p. 20
- **By rectum**, initially 15–30 mg every 4 hours, adjusted according to response

**Note**

- The doses stated above refer equally to morphine hydrochloride and sulphate

**Oral solutions**

**Note** For advice on transfer from oral solutions of morphine to modified-release preparations of morphine, see Prescribing in Palliative Care, p. 20

**Morphine Oral Solutions**

**Tablets**

**Tablets**, f/c, scored, morphine sulphate 10 mg (blue), net price 50-mL pack = £4.95; 300-mL pack = £4.98; 500-mL pack = £7.47. Label: 2

**Oramorph** (Boehringer Ingelheim)

**Oramorph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oramorph** (Boehringer Ingelheim)

**Oramorph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oramorph** (Boehringer Ingelheim)

**Oramorph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2

**Oormalph** (Boehringer Ingelheim)

**Oormalph** oral solution (oral), morphine sulphate 10 mg/5 mL, net price 100-mL pack = £1.78; 300-mL pack = £4.95; 500-mL pack = £7.47. Label: 2
4.7.2 Opioid analgesics

Morphine Sulphate (Non-proprietary) (9)

Injection, morphine sulphate 10, 15, 20, and 30 mg/mL, net price 1- and 2-mL amp (all) = £72–£1.40

Intravenous infusion, morphine sulphate 1 mg/mL, net price 50-mL vial = £5.00; 2 mg/mL, 50-mL vial = £5.89

Minijet® Morphine Sulphate (UCB Pharma) (9)

Injection, morphine sulphate 1 mg/mL, net price 10-mL disposable syringe = £15.00

Injection with antiemetic

For prescribing information on cyclizine, see section 4.6

Caution In myocardial infarction cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids, section 4.6. Not recommended in cardiovascular disease, see Naunyn and Vormling, p. 22

Cyclimorph® (Andipharm) (9)

Cyclimorph-10® Injection, morphine tartrate 10 mg, cyclazoline tartrate 50 mg/mL, net price 1-mL amp = £1.75

Dose ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more often than every 4 hours; max. 3 doses in any 24-hour period

Cyclimorph-15® Injection, morphine tartrate 15 mg, cyclazoline tartrate 50 mg/mL, net price 1-mL amp = £1.82

Dose ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more often than every 4 hours; max. 3 doses in any 24-hour period

Oxycodeone Hydrochloride

Indications moderate to severe pain in patients with cancer; postoperative pain; severe pain

Cautions see notes above; also toxic psychosis; pancreatitis

Contra-indications see notes above; also acute abdomen; delayed gastric emptying; chronic constipation; cor pulmonale; acute porphyria (section 9.8.2)

Hepatic impairment avoid in moderate to severe impairment; see also notes above

Renal impairment avoid if eGFR less than 10 mL/minute/1.73m²; see also notes above

Pregnancy see notes above

Breast-feeding present in milk—avoid

Side-effects see notes above; also diarrhoea, abdominal pain, anorexia, dyspnoea; bronchospasm, dyspnoea, impaired cough reflex; asthenia, anxiety; chills; muscle fasciculation; less commonly paralytic ileus, cholestasis, gastritis, flatulence, dysphagia, taste disturbance, belching, hiccups, vasodilatation, supraventricular tachycardia, syncope, amnesia, hypoesthesia, restlessness, seizures, pyrexia, amniorrhoea, hypotonia, paraesthesia, disorientation, malaise, agitation, speech disorder, tremor, thirst, and dry skin

Dose

• By mouth, initially 5 mg every 4–6 hours, increased if necessary according to severity of pain, usual max. 400 mg daily, but some patients may require higher doses; CHILD under 18 years, see BNF for Children

• By slow intravenous injection, 1–10 mg every 4 hours when necessary; CHILD under 18 years, not recommended
270 4.7.2 Opioid analgesics

- By intravenous infusion, initially 2 mg/hour, adjusted according to response; CHILD under 18 years not recommended
- By subcutaneous injection, initially 5 mg every 4 hours when necessary; CHILD under 18 years, not recommended
- By subcutaneous infusion, initially 7.5 mg/24 hours adjusted according to response; CHILD under 18 years, not recommended
- Patient controlled analgesia (PCA), consult hospital protocols

**Note** 2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone

**Oxycodone** (Non-proprietary) (B)

**Injection**, oxycodone hydrochloride 10 mg/mL, net price 1-mL amp = £1.60, 2-mL amp = £3.20

**OxyNorm** (Napp) (B)

**Capsules**, oxycodone hydrochloride 5 mg (orange/beige), net price 56-cap pack = £11.36; 10 mg (white/beige), 56-cap pack = £22.73; 20 mg (pink/beige), 56-cap pack = £45.47. Label: 2

**Liquid** (= oral solution), sugar-free, oxycodone hydrochloride 5 mg/5 mL, net price 250 mL = £9.66. Label: 2

**Concentrate** (= concentrated oral solution), sugar-free, oxycodone hydrochloride 10 mg/mL, net price 120 mL = £66.39. Label: 2

**Injection**, oxycodone hydrochloride 10 mg/mL, net price 1-mL amp = £1.60, 2-mL amp = £3.20; 50 mg/mL, 1-mL amp = £14.02

**Note** The Scottish Medicines Consortium (p. 4) has advised (October 2004 and November 2010) that OxyNorm® injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine

**Modified release**

**OxyContin** (Napp) (B)

**Tablets**, f/c, m/r, oxycodone hydrochloride 5 mg (blue), price 28-tab pack = £12.46; 10 mg (white), 56-tab pack = £24.91; 20 mg (pink), 56-tab pack = £49.82; 40 mg (yellow), 56-tab pack = £99.66; 80 mg (green), 56-tab pack = £199.33. Label: 2, 25

**Dose** initially, 10 mg every 12 hours, increased if necessary according to severity of pain, usual max. 200 mg every 12 hours, but some patients may require higher doses—CHILD under 18 years see BNF for Children

**With naloxone**

**Targinact** (Napp) ▼ (B)

**Tablets** 5 mg/2.5 mg, f/c, m/r, oxycodone hydrochloride 5 mg, naloxone hydrochloride 2.5 mg (blue), net price 28-tab pack = £17.56. Label: 2, 25

**Tablets** 10 mg/5 mg, f/c, m/r, oxycodone hydrochloride 10 mg, naloxone hydrochloride 5 mg (white), net price 56-tab pack = £35.11. Label: 2, 25

**Tablets** 20 mg/10 mg, f/c, m/r, oxycodone hydrochloride 20 mg, naloxone hydrochloride 10 mg (pink), net price 56-tab pack = £70.22. Label: 2, 25

**Tablets** 40 mg/20 mg, f/c, m/r, oxycodone hydrochloride 40 mg, naloxone hydrochloride 20 mg (yellow), net price 56-tab pack = £140.44. Label: 2, 25

**Dose** severe pain responsive only to opioid analgesics. ADULT over 18 years not currently treated with opioid analgesics, initially 10 mg/5 mg every 12 hours, increased according to response; patients already receiving opioid analgesics can start with a higher

**dose of Targinact®; max. Targinact® 40 mg/20 mg every 12 hours**

**Note** Supplemental modified-release oxycodone (without naloxone) can be prescribed for patients who need higher doses—consult product literature

---

**PAPAVERETUM (Non-proprietary)** (B)

**Injection**, papaveretum 15.4 mg/mL (providing the equivalent of 5 mg of anhydrous morphine/mL), net price 1-mL amp = £1.64

**Note** The name Omnopon® was formerly used for papaveretum preparations

**With hyoscine**

For prescribing information on hyoscine, see section 4.6

**Papaveretum and Hyoscine Injection** (Non-proprietary) (B)

**Injection**, papaveretum 15.4 mg/mL (providing the equivalent of 10 mg of anhydrous morphine/mL), hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £3.57

**Dose** premedication, by subcutaneous or intramuscular injection, 0.5–1 mL

**Indications** moderate to severe pain, but see notes above

**Cautions** see notes above; also pancreatitis, arterial or pulmonary hypertension, cardiac arrhythmias, myocardial infarction, phaeochromocytoma; effects only partially reversed by naloxone

**Contra-indications** see notes above; patients dependent on opioids (can precipitate withdrawal); heart

**PENTAZOCINE (Non-proprietary)** (B)

**Injection**, pentazocine 40 mg/mL (providing the equivalent of 10 mg of anhydrous morphine/mL), net price 1-mL amp = £3.57

**Dose** pentazocine 10 mg/mL (providing the equivalent of 5 mg of anhydrous morphine/mL), hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £3.57

**Indications** moderate to severe pain, but see notes above

**Cautions** see notes above; also treated with opioid analgesics, initially 10 mg/5 mg every 12 hours, increased according to response; patients already receiving opioid analgesics can start with a higher

**PENTAZOCINE (Non-proprietary)** (B)

**Injection**, pentazocine 40 mg/mL (providing the equivalent of 10 mg of anhydrous morphine/mL), hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £3.57

**Dose** premedication, by subcutaneous or intramuscular injection, 0.5–1 mL

**Indications** moderate to severe pain, but see notes above

**Cautions** see notes above; also pancreatitis, arterial or pulmonary hypertension, cardiac arrhythmias, myocardial infarction, phaeochromocytoma; effects only partially reversed by naloxone

**Contra-indications** see notes above; patients dependent on opioids (can precipitate withdrawal); heart
failure secondary to chronic lung disease; acute porphyria (section 9.8.2)

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** small amount present in milk—caution

**Side-effects** see notes above; also abdominal pain, hypertension, syncope, sero, paraesthesia, tremor, raised intracranial pressure, disorientation, hypothermia, chills, blood disorders, myalgia, and toxic epidermal necrolysis

**Dose**
- By mouth, pentazocine hydrochloride 50 mg every 3–4 hours preferably after food (range 25–100 mg); max. 600 mg daily; **CHILD** 6–12 years 25 mg
- By subcutaneous, intramuscular, or intravenous injection, moderate pain, pentazocine 30 mg, severe pain 45–60 mg every 3–4 hours when necessary; max. 360 mg daily; **CHILD** over 1 year, by subcutaneous or intramuscular injection, up to 1 mg/kg, by intravenous injection up to 500 micrograms/kg

**Pentazocine (Non-proprietary)**

Capsules, pentazocine hydrochloride 50 mg, net price 28-cap pack = £16.55. Label: 2, 21

Tablets, pentazocine hydrochloride 25 mg, net price 28-tab pack = £23.09. Label: 2, 21

Injection, pentazocine 30 mg, (as lactate)/mL, net price 1-mL amp = £1.67; 2-mL amp = £3.21

**Dose**
- By mouth, **by mouth**, pentazocine hydrochloride 50 mg every 3–4 hours preferably after food (range 25–100 mg); max. 600 mg daily; **CHILD** 6–12 years 25 mg
- By subcutaneous, intramuscular, or intravenous injection, moderate pain, pentazocine 30 mg, severe pain 45–60 mg every 3–4 hours when necessary; max. 360 mg daily; **CHILD** over 1 year, by subcutaneous or intramuscular injection, up to 1 mg/kg, by intravenous injection up to 500 micrograms/kg

**Pentazocine (Non-proprietary)**

Capsules, pentazocine hydrochloride 50 mg, net price 28-cap pack = £16.55. Label: 2, 21

Tablets, pentazocine hydrochloride 25 mg, net price 28-tab pack = £23.09. Label: 2, 21

Injection, pentazocine 30 mg (as lactate)/mL, net price 1-mL amp = £1.67; 2-mL amp = £3.21

**PETHIDINE HYDROCHLORIDE**

**Indications** moderate to severe pain, obstetric analgesia; peri-operative analgesia

**Cautions** see notes above; not suitable for severe continuing pain; accumulation of metabolites may result in neurotoxicity; cardiac arrhythmias, severe cor pulmonale

**Contra-indications** see notes above; phaeochromocytoma

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** see notes above; also restlessness, tremor, and hypothermia; convulsions reported in overdosage

**Dose**
- **Acute pain**, by mouth, 50–150 mg every 4 hours; **CHILD** 0.5–2 mg/kg
- By subcutaneous or intramuscular injection, 25–100 mg (**ELDERLY** or debilitated, initially 25 mg), repeated after 4 hours; **CHILD**, by intramuscular injection, 0.5–2 mg/kg
- By slow intravenous injection, 25–50 mg (**ELDERLY** or debilitated, initially 25 mg), repeated after 4 hours
- Obstetric analgesia, by subcutaneous or intramuscular injection, 50–100 mg, repeated 1–3 hours later if necessary; max. 400 mg in 24 hours
- Premedication, by intramuscular injection, 25–100 mg 1 hour before operation (**ELDERLY** or debilitated, 25 mg); **CHILD** 0.5–2 mg/kg

**Pethidine (Non-proprietary)**

**Injection**, pethidine hydrochloride 50 mg, net price 1-mL amp = 48p, 2-mL amp = 51p; 10 mg/mL, 5-mL amp = £3.17, 10-mL amp = £2.18

**With promethazine** For prescribing information on promethazine hydrochloride, see section 3.4.1.

**Pamergan P100®** (Martindale)

**Injection**, pethidine hydrochloride 50 mg, promethazine hydrochloride 25 mg/mL, net price 2-mL amp = £1.44

**Dose** by intramuscular injection, p Comcast, 2 mL 60–90 minutes before operation, **CHILD** 8–12 years 0.75 mL, 13–16 years 1 mL, Obstetric analgesia, 1–2 mL every 4 hours if necessary

**Severe pain**, 1–2 mL every 4–6 hours if necessary

**Note** Although usually given intramuscularly, may be given intravenously after dilution to at least 10 mL with water for injections

**TRAMADOL HYDROCHLORIDE**

**Indications** moderate to severe pain

**Cautions** see notes above; impaired consciousness; excessive bronchial secretions; not suitable as a substitute in opioid-dependent patients

**General anaesthesia** Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported)

**Contra-indications** see notes above; uncontrolled epilepsy

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** embryotoxic in animal studies—manufacturers advise avoid; see also notes above

**Breast-feeding** amount probably too small to be harmful, but manufacturer advises avoid

**Side-effects** see notes above; also diarrhoea; fatigue; rarely anorexia, syncope, hypertension, bronchospasm, dyspnoea, wheezing, seizures, paraesthesia, and muscle weakness; blood disorders also reported

**Dose**
- **ADULT** and **CHILD** over 12 years, by mouth, 50–100 mg not more than every 4 hours; total of more than 400 mg daily not usually required
- **ADULT** and **CHILD** over 12 years, by intramuscular injection or by intravenous injection (over 2–3 minutes) or by intravenous infusion, 50–100 mg every 4–6 hours

Postoperative pain, 100 mg initially then 50 mg every 10–20 minutes if necessary during first hour to total max. 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours; max. 600 mg daily

**Tramadol Hydrochloride (Non-proprietary)**

Capsules, tramadol hydrochloride 50 mg, net price 30-cap pack = £1.22, 100-cap pack = £2.07. Label: 2

**Brands include Tramaks®**
Central nervous system

4.7.3 Neuropathic pain

Injection, tramadol hydrochloride 50 mg/mL, net price 2-mL amp = 95p

Zamadol® (Meda) (£)
Capsules, tramadol hydrochloride 50 mg, net price 100-cap pack = £8.00. Label: 2
Orodispersible tablets (Zamadol Meit®), tramadol hydrochloride 50 mg, net price 60-tab pack = £7.12. Label: 2, counselling, administration
Excipients include aspartame (section 9.4.1)

Tramquil® (Chiesi) (£)
Capsules, m/r, tramadol hydrochloride 10 mg (white), net price 60-cap pack = £12.14; 150 mg (yellow), 60-cap pack = £18.26; 150 mg, 30-tab pack = £36.52. Label: 2, 25
Dose ADULT and CHILD over 12 years, 50–100 mg twice daily increased if necessary; usual max. 200 mg once daily

Maxitram SR® (Chiesi) (£)
Capsules, m/r, tramadol hydrochloride 50 mg (white), net price 60-cap pack = £4.55; 100 mg (yellow), 60-cap pack = £12.14; 150 mg (yellow), 60-cap pack = £18.26; 200 mg (yellow), 60-cap pack = £24.28. Label: 2, 25
Dose ADULT and CHILD over 12 years, 100–200 mg twice daily, total of more than 400 mg daily not usually required

Zamadol® (Meda) (£)
Capsules, m/r, tramadol hydrochloride 50 mg (green), net price 60-cap pack = £7.20; 100 mg, 60-cap pack = £14.39; 150 mg (dark green), 60-cap pack = £21.59; 200 mg (yellow), 60-cap pack = £28.78. Label: 2, counselling, administration
Dose ADULT and CHILD over 12 years, 50–100 mg twice daily increased if necessary to 150–200 mg twice daily; total of more than 400 mg daily not usually required
Counselling Swallow whole or open capsule and swallow contents immediately without chewing

Zydol SR® (Grunenthal) (£)
Tablets, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.21; 200 mg (yellow), 60-tab pack = £24.28. Label: 2, 25
Dose ADULT and CHILD over 12 years, 100 mg twice daily increased if necessary to 150–200 mg twice daily; usual max. 400 mg daily

Zydol SR® (Grunenthal) (£)
Tablets, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.21; 200 mg (yellow), 60-tab pack = £24.28. Label: 2, 25
Dose ADULT and CHILD over 12 years, 100 mg twice daily increased if necessary to 150–200 mg twice daily; total of more than 400 mg daily not usually required

With paracetamol

Section 4.7.1

4.7.3 Neuropathic pain

Neuropathic pain, which occurs as a result of damage to neural tissue, includes phantom limb pain, compression neuropathies, peripheral neuropathies (e.g. due to diabetes (section 6.1.5), alcoholism, HIV infection, chemotherapy, idiopathic neuropathy), trauma, central pain (e.g. pain following stroke, spinal cord injury, and syringomyelia), and postherpetic neuralgia (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain occurs in an area of sensory deficit and may be described as burning, shooting or scalding and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management (see below) is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a tricyclic antidepressant or with certain antiepileptic drugs. Amin-
4.7.4 Antimigraine drugs

4.7.4.1 Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as aspirin, paracetamol (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a 5HT1-receptor agonist (‘triptan’). Ergot alkaloids are rarely required now; oral and rectal preparations are associated with many side-effects and they should be avoided in cerebrovascular or cardiovascular disease.

Excessive use of acute treatments for migraine (opoid and non-opioid analgesics, 5HT1 receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

Analgesics

Most migraine headaches respond to analgesics such as aspirin (p. 258) or paracetamol (p. 259) but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred. Compound preparations containing analgesics and antiemetics are available (section 4.7.1). The NSAID tolfenamic acid is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium, flurbiprofen, ibuprofen, and naproxen sodium (section 10.1.1) are also licensed for use in migraine.

**TOLFENAMIC ACID**

**Indications** treatment of acute migraine

**Cautions** see NSAIDs, section 10.1.1

**Contra-indications** see NSAIDs, section 10.1.1

**Hepatic impairment** section 10.1.1

**Renal impairment** section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** amount too small to be harmful

**Side-effects** see NSAIDs, section 10.1.1; also dysuria (most commonly in men), confusion, malaise, hallucination, paraesthesia, tremor, euphoria, fatigue, and visual disturbances reported

**Trigeminal neuralgia**

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine (p. 281) taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin (p. 288); the drug may be given by intravenous infusion (possibly as fosphenytoin) in a crisis (specialist use only).

**Chronic facial pain**

Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporomandibular dysfunction (previously termed temporomandibular joint dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants (section 4.3.1) may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

**Gabapentin** (p. 284) is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol (p. 271), morphine (p. 268), and oxycodone (p. 269); however, treatment with morphine or oxycodone should be initiated only under specialist supervision. Tramadol can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from topical local anaesthetic preparations, such as lidocaine medicated plasters (section 15.2), while awaiting specialist review.

Capsaicin (p. 664) is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia. A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain. Neuromodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

The management of trigeminal neuralgia and chronic facial pain are outlined below; for the management of neuropathic pain in palliative care, see p. 21; for the management of diabetic neuropathy, see section 6.1.5.

**Trigeminal neuralgia**

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine (p. 281) taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin (p. 288); the drug may be given by intravenous infusion (possibly as fosphenytoin) in a crisis (specialist use only).
Dose

- **ADULT** over 18 years, 200 mg at onset repeated once after 1–2 hours if necessary

Clotam Rapid® (Galen) (Galen)

Tablets, tolfenamic acid 200 mg, net price 10-tab pack = £15.00. Label: 21

5HT1-receptor agonists

A 5HT1-receptor agonist is of considerable value in the treatment of an acute migraine attack. The 5HT1-receptor agonists (‘triptans’) act on the 5HT (serotonin) 1B/1D receptors and are therefore sometimes referred to as 5HT1B/1D-receptor agonists. A 5HT1-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics. 5HT1-receptor agonists are not indicated for the treatment of hemiplegic, basilar, or ophthalmoplegic migraine.

The 5HT1-receptor agonists available for treating migraine are almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan. If a patient does not respond to one 5HT1-receptor agonist, an alternative 5HT1-receptor agonist should be tried. For patients who have prolonged attacks that frequently recur despite treatment with a 5HT1-receptor agonist, combination therapy with a NSAID such as naproxen should be considered. Sumatriptan or zolmitriptan are also used to treat(cluster headache (section 4.7.4.3).

Cautions

- 5HT1-receptor agonists should be used with caution in the elderly [unlicensed], and in conditions which predispose to coronary artery disease (pre-existing cardiac disease, see Contra-indications below); interactions: Appendix 1 (5HT1 agonists).

Contra-indications

- 5HT1-receptor agonists are contra-indicated in ischaemic heart disease, previous myocardial infarction, coronary vasospasm (including Prinzmetal’s angina), and uncontrolled or severe hypertension.

Breast-feeding

- present in milk—avoid breast-feeding

Pregnancy

- There is limited experience of using 5HT1-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

Side-effects

- Side-effects of the 5HT1-receptor agonists include sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body (including throat and chest—discontinue if intense, may be due to coronary vasospastic reaction or to anaphylaxis), flushing, dizziness, feeling of weakness; fatigue; nausea and vomiting also reported.

ALMOTRIPTAN

Indications

- treatment of acute migraine

Cautions

- see under 5HT1-receptor agonists above; sensitivity to sulfonamides; interactions: Appendix 1 (5HT1 agonists)

Contra-indications

- see under 5HT1-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

Hepatic impairment

- caution in mild to moderate impairment; avoid in severe impairment

Dose

- **ADULT** over 18 years, 40 mg repeated after 2 hours if migraine recurs (patient not responding to initial dose should not take second dose for same attack); max. 80 mg in 24 hours; **CHILD** and **adolescent** under 18 years not recommended

Almogran® (Almirall) (Almirall)

Tablets, f/c, almotriptan (as hydrogen malate) 12.5 mg, net price 3-tab pack = £0.97, 6-tab pack = £18.14; 9-tab pack = £27.20. Label: 3

ELETRIPTAN

Indications

- treatment of acute migraine

Cautions

- see under 5HT1-receptor agonists above; interactions: Appendix 1 (5HT1 agonists)

Contra-indications

- see under 5HT1-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack; arrhythmias; heart failure; peripheral vascular disease

Hepatic impairment

- avoid in severe impairment

Breast-feeding

- present in milk—avoid breast-feeding for 24 hours

Side-effects

- see under 5HT1-receptor agonists above; also abdominal pain, dry mouth, dyspepsia; tachycardia, palpitation; drowsiness, headache; pharyngitis, rhinitis, chills; myasthenia, myalgia; sweating; less commonly diarrhea, dyspepsia, thirst, anorexia, taste disturbance; dyspnoea, yawning, oedema, agitation, confusion, euphoria, depression, insomnia, depersonalisation, tremor, dysarthria, stupor, movement disorders, hyperventilation, urinary frequency, arthralgia, photophobia, visual disturbances, tinnitus, rash, and pruritus; rarely constipation, oesophagitis, bradycardia, asthma, syncope, lymphadenopathy, and menorrhagia; ischaemic colitis and hypertension also reported

Dose

- **ADULT** over 18 years, 40 mg repeated after 2 hours if migraine recurs (patient not responding to initial dose should not take second dose for same attack); increase to 80 mg for subsequent attacks if 40-mg dose inadequate; max. 80 mg in 24 hours

Relpax® (Pfizer) (Pfizer)

Tablets, f/c, orange, eletriptan (as hydrobromide) 20 mg, net price 6-tab pack = £22.50; 40 mg, 6-tab pack = £45.00. Label: 3

Renal impairment

- max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m²

Pregnancy

- see notes above

Breast-feeding

- present in milk in animal studies— withhold breast-feeding for 24 hours

Side-effects

- see under 5HT1-receptor agonists above; also transient increase in blood pressure, drowsiness; less commonly diarrhea, dyspepsia, dry mouth, chest pain, palpitation, paraesthesia, headache, myalgia, bone pain, tinnitus; very rarely myocardial infarction, and tachycardia

Dose

- 12.5 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 25 mg in 24 hours; **CHILD** and **adolescent** under 18 years not recommended

FROVATRIPTAN

Indications  treatment of acute migraine
Cautions  see under 5HT1-receptor agonists above; interactions: Appendix 1 (5HT, agonists)
Contra-indications  see under 5HT1-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease
Hepatic impairment  avoid in severe impairment
Pregnancy  see notes above
Breast-feeding  present in milk in animal studies— withhold breast-feeding for 24 hours

Side-effects  see under 5HT1-receptor agonists above; also acute radiation sickness

Dose  2.5 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 5 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

Migard® (Menarini) Tablets, f/c, frovatriptan (as succinate) 2.5 mg, net price 6-tab pack = £16.67. Label: 3

NARATRIPTAN

Indications  treatment of acute migraine
Cautions  see under 5HT1-receptor agonists above; sensitivity to sulfonamides; interactions: Appendix 1 (5HT, agonists)
Driving  Drowsiness may affect performance of skilled tasks (e.g. driving)
Contra-indications  see under 5HT1-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease
Hepatic impairment  avoid in severe impairment
Renal impairment  reduce dose to 5 mg in mild to moderate impairment; avoid in severe impairment
Pregnancy  see notes above
Breast-feeding  present in milk in animal studies— withhold breast-feeding for 24 hours

Side-effects  see under 5HT1-receptor agonists above; also dry mouth, dyspepsia, abdominal pain, paraesthesia, drowsiness, headache, visual disturbances, sweating, less commonly diarrhoea, dysphagia, flatulence, tachycardia, palpitation, hypertension, rhinitis, pharyngitis, sinusitis, laryngitis, tremor, anxiety, asthenia, insomnia, confusion, nervousness, impaired concentration, agitation, depression, depersonalisation, taste disturbances, micturition disorders, thirst, dehydration, arthralgia, muscle stiffness, tinnitus, vertigo, pruritus; rarely constipation, gastro-oesophageal reflux, irritable bowel syndrome, hiccup, peptic ulcer, stomatitis, bradycardia, hyperventilation, amnesia, abnormal dreams, hypertension, hypotonia, breast tenderness, hypocalcaemia, hypoglycaemia, bilirubinaemia, epistaxis, urticaria, pyrexia, and purpura

Dose  10 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 20 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

Maxalt® (MSD) Tablets, pink, rizatriptan (as benzoate) 5 mg, net price 6-tab pack = £26.74, 10 mg, 3-tab pack = £13.37, 6-tab pack = £26.74. Label: 3

Oral lyophilisates (Maxalt® Melt Wafers), rizatriptan (as benzoate) 10 mg, net price 3-wafer pack = £13.37, 6-wafer pack = £26.74. Label: 3, counselling, administration

Counselling Maxalt® Melt wafers should be placed on the tongue and allowed to dissolve
Excipients include aspartame equivalent to phenylalanine 2.1 mg (section 9.4.1)

SUMATRIPTAN

Indications  treatment of acute migraine; cluster headache (subcutaneous injection only)
Cautions  see under 5HT1-receptor agonists above; history of seizures; sensitivity to sulfonamides; interactions: Appendix 1 (5HT, agonists)
Driving  Drowsiness may affect performance of skilled tasks (e.g. driving)
Contra-indications  see under 5HT1-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease; moderate and severe hypertension
Hepatic impairment  reduce oral dose to 25–50 mg; avoid in severe impairment
Renal impairment  use with caution
Pregnancy  see notes above
Central nervous system

Breast-feeding present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours

Side-effects see under 5HT₁-receptor agonists above; also dyspnoea, drowsiness, transient increase in blood pressure, myalgia; also reported diarrhoea, ischaemic colitis, hypotension, bradycardia or tachycardia, palpitation, arrhythmias, myocardial infarction, Raynaud’s syndrome, anxiety, seizures, tremor, dystonia, nystagmus, arthralgia, visual disturbances, and sweating; epistaxis with nasal spray

Dose
- By mouth, 50 mg (some patients may require 100 mg); dose may be repeated after at least 2 hours if migraine recurs; max. 300 mg in 24 hours; CHILD under 18 years, see BNF for Children
- By subcutaneous injection using auto-injector, 6 mg; dose may be repeated once after at least 1 hour if headache recurs; max. 12 mg in 24 hours; CHILD 10–18 years see BNF for Children

Important Not for intravenous injection which may cause coronary vasospasm and angina
- Intranasally, 10–20 mg into one nostril; dose may be repeated once after at least 2 hours if migraine recurs; max. 40 mg in 24 hours; CHILD 12–18 years [unlicensed dose], 10–20 mg into one nostril; dose may be repeated once after at least 2 hours if migraine recurs; max. 40 mg in 24 hours

Note Patient not responding to initial dose should not take second dose for same attack

^

Zolmitriptan (Non-proprietary) [H]

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £1.71, 12-tab pack = £2.49; 100 mg, 6-tab pack = £2.43. Label: 3, 10, patient information leaflet

1. Sumatriptan 50 mg tablets can be sold to the public to treat acute migraine, cluster headache [unlicensed] or migraine, ADULT over 18 years, 2.5 mg repeated after not less than 2 hours if migraine persists or recurs (increase to 5 mg for subsequent attacks in patients not achieving satisfactory relief with 2.5-mg dose); max. 10 mg in 24 hours; CHILD 12–18 years see BNF for Children

Intranasally, 10–20 mg into one nostril; dose may be repeated once after at least 2 hours if migraine recurs; max. 40 mg in 24 hours; CHILD 12–18 years [unlicensed dose], 10–20 mg into one nostril; dose may be repeated once after at least 2 hours if migraine recurs; max. 40 mg in 24 hours

Note Patient not responding to initial dose should not take second dose for same attack

^

Imigran® (GSK) [H]

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £28.54; 100 mg, 6-tab pack = £42.90. Label: 3, 10, patient information leaflet

Injection, sumatriptan (as succinate) 12 mg/mL (= 6 mg/0.5-mL syringe), net price, treatment pack (2 x 0.5-mL prefilled syringes and auto-injector) = £42.47; refill pack 2 x 0.5-mL prefilled cartridges = £40.41. Label: 3, 10, patient information leaflet

Nasal spray, sumatriptan 10 mg/0.1-mL actuation, net price 2 unit-dose spray device = £11.80; 20 mg/0.1-mL actuation, 2 unit-dose spray device = £11.80, 6 unit-dose spray device = £35.39. Label: 3, 10, patient information leaflet

Imigran® Radis (GSK) [H]

Tablets, f/c, sumatriptan (as succinate) 50 mg (pink), net price 6-tab pack = £23.90; 100 mg (white), 6-tab pack = £42.90. Label: 3, 10, patient information leaflet

Ergot alkaloids

The value of ergotamine for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and muscular cramps; it is best avoided. The recommended doses of ergotamine preparations should not be exceeded and treatment should not be repeated at intervals of less than 4 days. To avoid habituation the frequency of administration of ergotamine should be limited to no more than twice a month. It should never be prescribed prophylactically but in the management of cluster headache a low dose (e.g. ergotamine 1 mg at night for 6 nights in 7) is occasionally given for 1 to 2 weeks [unlicensed indication].

Ergot alkaloids

Indications treatment of acute migraine and migraine variants unresponsive to analgesics

Cautions risk of peripheral vasospasm (see below); elderly; dependence (see Ergot Alkaloids above); cardiac disease; anaemia; interactions: Appendix 1 (ergot alkaloids)

Peripheral vasospasm Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor

^
Contra-indications peripheral vascular disease, coronary heart disease, obliteratorive vascular disease and Raynaud’s syndrome, temporal arteritis, sepsis, severe or inadequately controlled hypertension, hyperthyroidism, acute porphyria (section 9.8.2)

Hepatic impairment avoid in severe impairment—risk of toxicity increased

Renal impairment avoid; risk of renal vasoconstriction

Pregnancy avoid; oxytocic effect on the uterus

Breast-feeding avoid; ergotism may occur in infant; repeated doses may inhibit lactation

Side-effects abdominal pain, nausea, vomiting; dizziness; less commonly diarrhoea, pain and weakness in extremities, cyanosis, peripheral vasoconstriction, paraesthesia, and hypoaesthesia; rarely intestinal ischaemia, arrhythmias, increased blood pressure, bradycardia, tachycardia, dyspnoea, ergotism (including absence of pulse and numbness in extremities), myalgia, rash, and urticaria; very rarely myocardial ischaemia, myocardial infection, heart-valve fibrosis, and gangrene; constipation, dry mouth, cerebral ischaemia, thrombosis, drowsiness, sleep disturbances, tremor, seizures, extrapyramidal effects, anxiety, depression, confusion, hallucinations, renal artery spasm, urinary retention, blood disorders, blurred vision, and arthralgia also reported; with suppositories rectal and anal ulcers on prolonged use

Dose

• See under preparations below

Caffergot® (Alliance) Tablets, s/c, ergotamine tartrate 1 mg, caffeine 100 mg, net price 30-tab pack = £5.02. Label: 18, counselling, dosage

Dose ADULT and CHILD over 12 years, 1–2 tablets at onset; max. 4 tablets in 24 hours; not to be repeated at intervals of less than 4 days; max. 8 tablets in one week (but see also notes above)

Suppositories, ergotamine tartrate 2 mg, caffeine 100 mg, net price 30 = £10.13. Label: 18, counselling, dosage

Dose ADULT and CHILD over 12 years, 1 suppository at onset; max. 2 in 24 hours; max. 4 suppositories in one week (but see also notes above)

Migril® (Wockhardt) Tablets, scored, ergotamine tartrate 2 mg, cyclazine hydrochloride 50 mg, caffeine hydrate 100 mg, net price 100 = £51.00. Label: 2, 18, counselling, dosage

Dose 1 tablet at onset, followed after 30 minutes by ½–1 tablet, repeated every 30 minutes if necessary; max. 3 tablets in 24 hours, 4 tablets per attack, 6 tablets in one week (but see also notes above); CHILD not recommended

Antiemetics

Antiemetics (section 4.6), such as metoclopramide or domperidone, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Metoclopramide and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide are a convenient alternative (important: for warnings relating to extrapyramidal effects of metoclopramide particularly in children and young adults, see p. 249).

4.7.4.2 Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine, see section 7.3.1 for advice.

Preventive treatment for migraine should be considered for patients who:

• suffer at least two attacks a month;
• suffer an increasing frequency of headaches;
• suffer significant disability despite suitable treatment for migraine attacks;
• cannot take suitable treatment for migraine attacks.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migrainous infarction.

The beta-blockers propranolol, atenolol, metoprolol, nadolol, and timolol (section 2.4) are all effective. Propranolol is the most commonly used. Tricyclic antidepressants (section 4.3.1) [unlicensed indication], topiramate (section 4.8.1), sodium valproate (section 4.8.1) [unlicensed indication], valproic acid (section 4.2.3) [unlicensed indication], and gabapentin (section 4.8.1) [unlicensed indication] are also effective for preventing migraine.

Pizotifen is an antihistamine and a serotonin-receptor antagonist, structurally related to the tricyclic antidepressants. It is of limited value and may cause weight gain.

Botulinum toxin type A is licensed for the prophylaxis of headaches in adults with chronic migraine, defined as headache on at least 15 days per month, of which at least 8 of those days are with migraine.

Clonidine (Dixarit®) is not recommended; it can aggravate depression and cause insomnia. Methylsergide, a semi-synthetic ergot alkaloid, has dangerous side-effects (retroperitoneal fibrosis and fibrosis of the heart valves and pleura); important: it should only be administered under hospital supervision.

Pizotifen

Indications prevention of vascular headache including classical migraine, common migraine, and cluster headache

Cautions urinary retention; susceptibility to angle-closure glaucoma; history of epilepsy; interactions: Appendix 1 (pizotifen)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Renal impairment use with caution

Pregnancy avoid unless potential benefit outweighs risk

Breast-feeding amount probably too small to be harmful, but manufacturer advises avoid

Side-effects dry mouth, nausea; dizziness, drowsiness, increased appetite, weight gain; less commonly constipation; rarely anxiety, aggression, insomnia, paraesthesia, hallucination, depression, arthralgia, myalgia; very rarely seizures

Dose

• Initially 500 micrograms at night increased gradually to usual dose of 1.5 mg at night or in 3 divided doses; may be further increased up to max. daily dose 4.5 mg (but rarely necessary), max. single dose 3 mg. CHILD
278 4.7.4 Antimigraine drugs

over 5 years, up to 1.5 mg daily in divided doses; max. single dose at night 1 mg

Pizotifen (Non-proprietary) [NH]
Tablets, pizotifen (as hydrogen malate), 500 micrograms, net price 28-tab pack = £1.28; 1.5 mg, 28-tab pack = £2.17. Label: 2

Sanomigran® (Novartis) [NH]
Tablets, both ivory-yellow, s/c, pizotifen (as hydrogen malate), 500 micrograms, net price 60-tab pack = £2.06; 1.5 mg, 28-tab pack = £3.42. Label: 2

Elxi®; pizotifen (as hydrogen malate) 250 micrograms/5 mL, net price 300 mL = £3.61. Label: 2

CLONIDINE HYDROCHLORIDE

Indications prevention of recurrent migraine (but see notes above), vascular headache, menopausal flushing; hypertension (section 2.5.2)

Cautions depressive illness; heart failure; Raynaud’s syndrome; concurrent antihypertensive therapy; cerebrovascular disease; polynuropathy; constipation; interactions: Appendix 1 (clonidine)

Contra-indications severe bradyarrhythmia

Renal impairment use with caution in severe impairment—reduce initial dose and increase gradually

Pregnancy avoid unless potential benefit outweighs risk

Breast-feeding avoid

Side-effects constipation, dry mouth, nausea, vomiting; postural hypotension; depression, sleep disorder, dizziness, headache, drowsiness; erectile dysfunction; less commonly Raynaud’s syndrome, paraesthesia, hallucination, rash, and pruritus; rarely AV block, gynaecomastia, and alopecia

Dose
- Initially 1 mg at bedtime, increased gradually over about 2 weeks to 2–3 mg 3 times daily with food (see notes above); CHILD not recommended
- Diarrhoea associated with carcinoid syndrome, usual range, 12–20 mg daily (hospital supervision); CHILD not recommended

Deseril® (Alliance) [NH]
Tablets, s/c, methysergide (as maleate) 1 mg, net price 60-tab pack = £12.94. Label: 2, 21

Hepatic impairment avoid

Renal impairment avoid

Pregnancy avoid

Breast-feeding avoid

Side-effects nausea, vomiting, heartburn, abdominal discomfort, drowsiness, and dizziness occur frequently in initial treatment; mental and behavioural disturbances, insomnia, oedema, weight gain, rashes, loss of scalp hair, cramps, arterial spasm (including coronary artery spasm with angina and possible myocardial infarction), paraesthesias of extremities, postural hypotension, and tachycardia also occur; retroperitoneal and other abnormal fibrotic reactions may occur on prolonged administration, requiring immediate withdrawal of treatment

Dose

- Initially 1 mg at bedtime, increased gradually over about 2 weeks to 2–3 mg 3 times daily with food (see notes above); CHILD not recommended
- Diarrhoea associated with carcinoid syndrome, usual range, 12–20 mg daily (hospital supervision); CHILD not recommended

Cluster headache and the trigeminal autonomic cephalalgias

Cluster headache rarely responds to standard analgesics. Sumatriptan (p. 275) given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil (p. 133) or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone (section 6.3.2) can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil during verapamil titration. The dose of prednisolone for monotherapy or adjunctive therapy is 60–100 mg once daily for 2–5 days followed by a dose reduction of 10 mg every 2–3 days until prednisolone is discontinued.

Ergotamine, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods. Methysergide is effective but must be used with extreme caution (section 4.7.4.2) and only if other drugs cannot be used or if they are not effective.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.
Interactions

Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or hepatic enzyme inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

For interactions of antiepileptic drugs, see Appendix 1; for advice on hormonal contraception and enzyme-inducing drugs, see section 7.3.1 and section 7.3.2.

Significant interactions that occur between antiepileptics and that may affect dosing requirements are as follows:

- **Carbamazepine**
  - Often lowers plasma concentration of clonazepam, clonazepam, lamotrigine, phenytoin (but may also raise phenytoin concentration), tiagabine, topiramate, valproate, zonisamide, and an active metabolite of oxcarbazepine
  - Sometimes lowers plasma concentration of eslicarbazepine, ethosuximide, primidone (but tendency for corresponding increase in phenobarbital level), and rufinamide

- **Eslicarbazepine**
  - Often raises plasma concentration of phenytoin
  - Sometimes lowers plasma concentration of carbamazepine

- **Ethosuximide**
  - Sometimes raises plasma concentration of an active metabolite of carbamazepine

- **Lamotrigine**
  - Sometimes raises plasma concentration of an active metabolite of carbamazepine

- **Oxcarbazepine**
  - Sometimes lowers plasma concentration of carbamazepine (but may raise concentration of an active metabolite of carbamazepine)
  - Sometimes raises plasma concentration of phenytoin

- **Phenytoin**
  - Often lowers plasma concentration of clonazepam, carbamazepine, eslicarbazepine, lamotrigine, tiagabine, topiramate, valproate, zonisamide, and an active metabolite of oxcarbazepine
  - Often raises plasma concentration of phenobarbital

- **Phenobarbital or primidone**
  - Often lowers plasma concentration of carbamazepine, clonazepam, lamotrigine, phenytoin (but may also raise phenytoin concentration), tiagabine, valproate, and zonisamide

- **Rufinamide**
  - Sometimes lowers plasma concentration of ethosuximide and rufinamide

- **Phenobarbital**
  - Sometimes lowers plasma concentration of ethosuximide, primidone (by increasing conversion to phenobarbital), and rufinamide

- **Topiramate**
  - Sometimes raises plasma concentration of phenytoin

- **Valproate**
  - Sometimes lowers plasma concentration of an active metabolite of oxcarbazepine
  - Often raises plasma concentration of lamotrigine, primidone, phenobarbital, phenytoin (but may also lower), and an active metabolite of carbamazepine

- **Vigabatrin**
  - Often lowers plasma concentration of phenytoin

- **Valproate**
  - Sometimes lowers plasma concentration of an active metabolite of carbamazepine

Note: Check under each drug for possible interactions when two or more antiepileptic drugs are used.
Withdrawal Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this may precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal.

In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Driving Patients with epilepsy may drive a motor vehicle (but not a large goods or passenger carrying vehicle) provided that they have been seizure-free for one year or, if subject to attacks only while asleep, have established a 3-year period of asleep attacks without awake attacks. Those affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months afterwards (see also Drugs and Driving under General Guidance, p. 3).

Patients who have had a first or single epileptic seizure must not drive for 6 months (5 years in the case of large goods or passenger carrying vehicles) after the event; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive because no abnormality was detected on investigation.

Pregnancy Women of child-bearing potential should discuss the impact of both epilepsy and the treatment of epilepsy on the outcome of pregnancy with a specialist. There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of major and minor congenital malformations, and with developmental delay. Valproate should not be prescribed unless there is no safer alternative and only after a careful discussion of the risks; doses greater than 1 g daily are associated with an increased risk of teratogenicity. There is also an increased risk of teratogenicity with phenytoin, primidone, lamotrigine, and carbamazepine. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Women of child-bearing potential who take antiepileptic drugs should be given contraceptive advice. Some antiepileptic drugs, in particular benzodiazepines and antiepileptic drugs, in particular benzodiazepines and phenobarbitals, increase the risk of harm to the fetus.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus.

To reduce the risk of neural tube defects, folate supplementation (section 9.1.2) is advised before conception and throughout the first trimester.

The concentration of antiepileptic drugs in the plasma can change during pregnancy, particularly in the later stages. Doses of phenytoin (see p. 288), carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored.

Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol, see section 4.8.2.

Routine injection of vitamin K (section 9.6.6) at birth minimises the risk of neonatal haemorrhage associated with antiepileptics.

Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

Epilepsy and Pregnancy Register All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

Breast-feeding Breast-feeding is acceptable with all antiepileptic drugs taken in normal doses, with the possible exception of the barbiturates and some of the newer antiepileptics (see under individual drugs).

Focal seizures with or without secondary generalisation Carbamazepine, lamotrigine, oxcarbazepine, and sodium valproate are the drugs of choice for focal seizures; second-line drugs include clobazam, gabapentin, levetiracetam, pregabalin, tiagabine, topiramate, and zonisamide.

Generalised seizures Tonic-clonic seizures The drugs of choice for tonic-clonic seizures are carbamazepine, lamotrigine, and sodium valproate. Clobazam, levetiracetam, oxcarbazepine, and topiramate are second-line drugs.
Absence seizures Ethosuximide and sodium valproate are the drugs of choice in typical absence seizures; alternatives include clonazepam and lamotrigine. Sodium valproate is also highly effective in treating the generalised tonic-clonic seizures which can co-exist with absence seizures in idiopathic primary generalised epilepsy.

Myoclonic seizures Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice; clonazepam and levetiracetam can also be used. Alternatives include lamotrigine and topiramate, but lamotrigine may occasionally exacerbate myoclonic seizures. For reference to the adjunctive use of piracetam, see section 4.9.3. Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that co-exist with myoclonic seizures in idiopathic generalised epilepsy.

Atypical absence, atonic, and tonic seizures Atypical absence, atonic, and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate, lamotrigine, and clonazepam can be tried. Second-line drugs that are occasionally helpful include clonazepam, ethosuximide, levetiracetam, and topiramate.

Epilepsy syndromes Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine and rufinamide in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

For more information on epilepsy syndromes in children, see BNF for Children, section 4.8.1. Prescribing information for stiripentol (Diacomit) in severe myoclonic epilepsy of infancy (Draevet syndrome) can also be found in BNF for Children.

Carbamazepine and related antiepileptics

Carbamazepine is a drug of choice for simple and complex focal seizures and for tonic-clonic seizures secondary to a focal discharge. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly with increments of 100–200 mg every two weeks. Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly. They may be reduced by altering the timing of medication; use of modified-release tablets also significantly lessens the incidence of dose-related side-effects.

Oxcarbazepine is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures.

Eslicarbazepine is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.

Myoclonic seizures Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice; clonazepam and levetiracetam can also be used. Alternatives include lamotrigine and topiramate, but lamotrigine may occasionally exacerbate myoclonic seizures. For reference to the adjunctive use of piracetam, see section 4.9.3. Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that co-exist with myoclonic seizures in idiopathic generalised epilepsy.

Atypical absence, atonic, and tonic seizures Atypical absence, atonic, and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate, lamotrigine, and clonazepam can be tried. Second-line drugs that are occasionally helpful include clonazepam, ethosuximide, levetiracetam, and topiramate.

Epilepsy syndromes Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine and rufinamide in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

For more information on epilepsy syndromes in children, see BNF for Children, section 4.8.1. Prescribing information for stiripentol (Diacomit) in severe myoclonic epilepsy of infancy (Draevet syndrome) can also be found in BNF for Children.

Carbamazepine and related antiepileptics

Carbamazepine is a drug of choice for simple and complex focal seizures and for tonic-clonic seizures secondary to a focal discharge. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly with increments of 100–200 mg every two weeks. Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly. They may be reduced by altering the timing of medication; use of modified-release tablets also significantly lessens the incidence of dose-related side-effects.

Oxcarbazepine is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures.

Eslicarbazepine is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.

The Scottish Medicines Consortium (p. 4) has advised (October 2010) that eslicarbazepine (Zebinix®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.

**CARBAMAZEPINE**

**Indications** focal and secondary generalised tonic-clonic seizures, primary generalised tonic-clonic seizures; trigeminal neuralgia; prophylaxis of bipolar disorder unresponsive to lithium; adjunct in acute alcohol withdrawal [unlicensed] (section 4.10.1); diabetic neuropathy [unlicensed] (section 6.1.5)

**Cautions** cardiac disease (see also Contra-indications); skin reactions (see also Blood, Hepatic, or Skin Disorders, below and under Side-effects); test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele); history of haematological reactions to other drugs; manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain); may exacerbate absence and myoclonic seizures; consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium; susceptibility to angle-closure glaucoma, cross-sensitivity reported with oxcarbazepine and with phentoin; avoid abrupt withdrawal; interactions: see p. 279 and Appendix 1 (carbamazepine)

**Blood, hepatic, or skin disorders** Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

**Contra-indications** AV conduction abnormalities (unless paced); history of bone marrow depression, acute porphyria (section 9.8.2); hypersensitivity to tricyclic antidepressants

**Hepatic impairment** metabolism impaired in advanced liver disease; see also Blood, Hepatic, or Skin Disorders, above

**Renal impairment** use with caution

**Pregnancy** see Pregnancy, p. 280

**Breast-feeding** amount probably too small to be harmful but monitor infant for possible adverse reactions; see also Breast-feeding, p. 280

**Side-effects** see notes above; dry mouth, nausea, vomiting; oedema; ataxia, dizziness, drowsiness, fatigue, headache; hyponatraemia (leading in rare cases to water intoxication); blood disorders (including eosinophilia, leucopenia, thrombocytopenia, haemolytic anaemia, and aplastic anaemia); dermatitis, and urticaria; less commonly diarrhoea, constipation, involuntary movements (including myastigmas), visual disturbances; rarely abdominal pain, anorexia, hepatitis, jaundice, vanishing bile duct syndrome, cardiac conduction disorders, hypertension, hypotension, peripheral neuropathy, dysarthria, aggression, agitation, confusion, depression, hallucinations, restlessness, paraesthesia, lymph node enlargement, muscle weakness, systemic lupus erythematosus, and delayed multi-organ hypersensitivity disorder; very
rarely pancreatitis, stomatitis, hepatic failure, taste disturbance, exacerbation of coronary artery disease, AV block with syncope, circulatory collapse, hypercholesterolaemia, thrombophlebitis, thromboembolism, pulmonary hypersensitivity (with dyspnoea, pneumonia, or pneumonia), psychosis, neuroleptic malignant syndrome, osteomalacia (see Caution), osteoporosis, galactorrhoea, gynaecomastia, impaired male fertility, interstitial nephritis, renal failure, sexual dysfunction, urinary frequency, urinary retention, arthralgia, muscle pain, muscle spasm, conjunctivitis, angle-closure glaucoma, hearing disorders, acne, alterations in skin pigmentation, alopecia, hirsutism, sweating, photosensitivity, purpura, Stevens-Johnson syndrome, toxic epidermal necrolysis, and aseptic meningitis; suicidal ideation.

**Dose**

**Note**

Different preparations may vary in bioavailability; to avoid reduced effect or excessive side-effects, it may be prudent to avoid changing the formulation.

- **By mouth**, epilepsy, initially, 100–200 mg 1–2 times daily; increased slowly (see above) to usual dose of 0.8–1.2 g daily in divided doses; in some cases 1.6–2 g daily in divided doses may be needed; **Elderly** reduce initial dose; **Child** daily in divided doses, up to 1 year 100–200 mg, 1–5 years 200–400 mg, 5–10 years 400–600 mg, 10–15 years 0.6–1 g.

- **Trigeminal neuralgia**, initially 100 mg 1–2 times daily (but some patients may require higher initial dose), increased gradually according to response; usual dose 200 mg 3–4 times daily, up to 1.6 g daily in some patients.

Diabetic neuropathy [unlicensed indication], initially 100 mg 1–2 times daily, increased gradually according to response; usual dose 200 mg 3–4 times daily, up to 1.6 g daily in some patients.

Prophylaxis of bipolar disorder unresponsive to lithium (see also section 4.2.3), initially 400 mg daily in divided doses increased until symptoms controlled; usual range 400–600 mg daily; max. 1.6 g daily.

Treatment of alcohol withdrawal [unlicensed indication], initially 800 mg daily in divided doses, reduced gradually over 5 to 20 days to usual treatment duration 7–10 days.

- **By rectum**, epilepsy, for short-term use (max. 7 days); when oral therapy temporarily not possible; 125 mg suppository approx. equivalent to 100-mg tablet, but final adjustment should always depend on clinical response (plasma concentration monitoring recommended); max. 1 g daily in 4 divided doses.

**Note**

Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre).

**Carbamazepine Tablets** (Non-proprietary)

**ESLICARBAZEPINE ACETATE**

**Indications**

see notes above.

**Cautions**

avoid abrupt withdrawal; hyponatraemia (monitor plasma-sodium concentration in patients at risk and discontinue treatment if hyponatraemia occurs); PR-interval prolongation (avoid concomitant administration of drugs that prolong PR interval); elderly: interactions: see p. 279 and Appendix 1 (eslicarbazine);

**Contra-indications**

second- or third-degree AV block

**Hepatic impairment**

avoid in severe impairment—no information available.

**Renal impairment**

reduce initial dose to 400 mg every other day for 2 weeks then 400 mg once daily if eGFR 30–60 mL/minute/1.73 m²; adjusted according to response; avoid if eGFR less than 30 mL/minute/1.73 m².

**Pregnancy**

see Pregnancy, p. 280

**Breast-feeding**

manufacturer advises avoid—present in milk in animal studies; see also Breast-feeding, p. 280

**Side-effects**

gastro-intestinal disturbances; dizziness, drowsiness, headache, impaired coordination, tremor, visual disturbances, fatigue; rash; less commonly dry mouth, dehydration, gingival hyperplasia, stomatitis; palpititation, bradycardia, hypertension, hypotenension, epistaxis, appetite changes, weight changes, agitation, hyperactivity, confusion, mood changes, psychosis, impaired memory, insomnia, dysaesthesia, dystonia, parosmia, movement disorders, convulsions, peripheral neuropathy, nyctagmus, dysarthria, taste disturbance, liver disorders, hypothroidism, anaemia, hyponatraemia (see Caution), electrolyte imbalance, tinnitus, alopecia, sweating, nail disorder, myalgia, nocturia, menstruation changes, malaise, chills, per...
Oxcarbazepine

**Indications**  see notes above

**Cautions** hypersensitivity to carbamazepine; avoid abrupt withdrawal; hypotenaraemia (monitor plasma-sodium concentration in patients at risk); heat failure (monitor body-weight), cardiac conduction disorders; avoid in acute porphyria (section 9.8.2); **interactions:** see p. 279 and Appendix 1 (oxcarbazepine)

**Blood, hepatic, or skin disorders** Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, sore throat, rash, blistering, mouth ulcers, bruising, or bleeding develop

**Hepatic impairment** caution in severe impairment—no information available

**Renal impairment** halve initial dose if eGFR less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week

**Pregnancy** see Pregnancy, p. 280

**Breast-feeding** present in milk—manufacturer advises avoid; see also Breast-feeding, p. 280

**Side-effects** nausea, vomiting, constipation, diarrhoea, abdominal pain; dizziness, headache, drowsiness, agitation, amnesia, anaesthesia, ataxia, confusion, impaired concentration, depression, tremor; hypotenaraemia; acne, alopecia, rash, nyctagmus, visual disorders including diplopia; less commonly urticaria, leucopenia; very rarely hepatitis, pancreatitis, arthralgias, blood disorders, systemic lupus erythematosus, Stevens-Johnson syndrome, and toxic epidermal necrolysis; hypertension and hypothyroidism also reported; suicidal ideation

**Dose**

- **ADULT** over 18 years, initially 400 mg once daily, increased after 1–2 weeks to 800 mg once daily; max. 1.2 g

- **CHILD**
  - 1 month–6 years, initially 10 mg/kg (max. 250 mg) daily in 2 divided doses, increased gradually over 2–3 weeks to usual dose of 20–40 mg/kg (max. 1 g) daily in 2 divided doses; total daily dose may be given in 3 divided doses
  - 6–9 years, initially 500 mg daily in 2 divided doses; total daily dose may be given in 3 divided doses
  - 9–12 years initially 1 g) daily in 2 divided doses; total daily dose may be given in 3 divided doses
  - over 12 years, initially 1 g daily in 2 divided doses; total daily dose may be given in 3 divided doses

**Note** In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine

**Oxcarbazepine (Non-proprietary)**

**Tablets**, oxcarbazepine 150 mg, net price 50-tab pack = £11.02; 300 mg, 50-tab pack = £22.38; 600 mg, 50-tab pack = £44.72. Label: 3, 8, counselling, blood disorders (see above), driving (see notes above)

**Trileptal® (Novartis)**

**Tablets**, f/c, scored, oxcarbazepine 150 mg (green), net price 50-tab pack = £8.50; 300 mg (yellow), 50-tab pack = £17.00; 600 mg (pink), 50-tab pack = £34.00. Label: 3, 8, counselling, blood, hepatic or skin disorders (see above), driving (see notes above)

**Oral suspension**, sugar-free, oxcarbazepine 300 mg/5 mL, net price 250 mL (with oral syringe) = £34.00. Label: 3, 8, counselling, blood, hepatic or skin disorders (see above), driving (see notes above)

Ethosuximide

**Indications**  see notes above

**Cautions** avoid abrupt withdrawal avoid in acute porphyria (section 9.8.2); **interactions:** see p. 279 and Appendix 1 (ethosuximide)

**Blood disorders** Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, sore throat, mouth ulcers, bruising, or bleeding develop

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** see Pregnancy, p. 280

**Breast-feeding** present in milk; hyperexcitability and sedation reported; see also Breast-feeding, p. 280

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, diarrhea, abdominal pain, anorexia, weight loss); less frequently headache, fatigue, drowsiness, dizziness, hiccup, ataxia, euphoria, irritability, aggresssion, impaired concentration; rarely tongue swelling, sleep disturbances, night terrors, depression, psychosis, photophobia, dyskinesia, increased libido, vaginal bleeding, myopia, gingival hypertrophy, and rash; also reported hyperactivity, increase in seizure frequency, blood disorders such as leucopenia, agranulocytosis, pancytopenia, and aplastic anaemia (blood counts required if features of infection), systemic lupus erythematosus, and Stevens-Johnson syndrome; suicidal ideation

**Dose**

- **ADULT** and **CHILD** over 6 years, initially 500 mg daily in 2 divided doses, increased by 250 mg every 4–7 days to usual dose of 1–1.5 g daily in 2 divided doses; occasionally up to 2 g daily may be needed;
- **CHILD** 1 month–6 years, initially 10 mg/kg (max. 250 mg) daily in 2 divided doses, increased gradually over 2–3 weeks to usual dose of 20–40 mg/kg (max. 1 g) daily in 2 divided doses; total daily dose may be given in 3 divided doses

**Ethosuximide (Non-proprietary)**

**Capsules**, ethosuximide 250 mg, net price 56-cap pack = £38.23. Label: 8, counselling, blood disorders (see above), driving (see notes above)

**Emeside® (Chemidex)**

**Syrup**, black currant, ethosuximide 250 mg/5 mL, net price 200-mL pack = £6.60. Label: 8, counselling, blood disorders (see above), driving (see notes above)

**Zarontin® (Pfizer)**

**Syrup**, yellow, ethosuximide 250 mg/5 mL, net price 200-mL pack = £4.22. Label: 8, counselling, blood disorders (see above), driving (see notes above)
Gabapentin and pregabalin

Gabapentin and pregabalin are used for the treatment of focal seizures with or without secondary generalisation. They are also licensed for the treatment of neuropathic pain (p. 272). Pregabalin is licensed for the treatment of generalised anxiety disorder (p. 233). Gabapentin is an effective treatment for migraine prophylaxis [unlicensed] (p. 277).

The Scottish Medicines Consortium (p. 4) has advised (July 2007) that pregabalin (Lyrica®) is not recommended for the treatment of central neuropathic pain. The Scottish Medicines Consortium (p. 4) has advised (April 2009) that pregabalin (Lyrica®) is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain in adults who have not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue if patient has not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue if patient.

Indications

Gabapentin monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation; peripheral neuropathic pain (section 4.7.3); migraine prophylaxis (section 4.7.4.2)

Caution

Avoid abrupt withdrawal (may cause anxiety, insomnia, nausea, pain, and sweating—taper off over at least 1 week); elderly; diabetes mellitus; false positive readings with some urinary protein tests; history of psychiatric illness; interactions: Appendix 1 (gabapentin)

Renal impairment

Reduce dose to 600–1800 mg daily in 3 divided doses if eGFR 50–80 mL/minute/1.73 m²; reduce dose to 300–900 mg daily in 3 divided doses if eGFR 30–50 mL/minute/1.73 m²; reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR 15–30 mL/minute/1.73 m²; reduce dose to 300 mg on alternate days (up to max. 300 mg daily) in 3 divided doses if eGFR less than 15 mL/minute/1.73 m²—consult product literature.

Pregnancy

See Pregnancy, p. 280

Breast-feeding

Present in milk—manufacturer advises use only if potential benefit outweighs risk; see also Breast-feeding, p. 280

Side-effects

Diarrhoea, dry mouth, dyspepsia, nausea, vomiting, constipation, abdominal pain, flatulence, appetite changes, gingivitis, weight gain, hypertension, vasodilation, oedema, dysphonia, cough, rhiinitis; confusion, depression, hostility, sleep disturbances, headache, dizziness, anxiety, amnesia, ataxia, dysarthria, nystagmus, tremor, asthenia, paraesthesia, hyperkinesia; influenza-like symptoms; impotence, urinary incontinence; leucopenia; myalgia, arthralgia; diplopia, amblyopia; rash, purpura, pruritus, acne; rarely pancreatitis, hepatitis, jaundice, palpitation, hallucinations, movement disorders, thrombocytopenia, blood-glucose fluctuations in patients with diabetes, tinnitus, acute renal failure, Stevens-Johnson syndrome, and alopecia; suicidal ideation; psychosis also reported

Dose

• Epilepsy, 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times daily on day 3 or initially 300 mg 3 times daily on day 1; then increased according to response in steps of 300 mg (in 3 divided doses) every 2–3 days; usual dose 0.9–3.6 g daily in 3 divided doses; CHILD 6–12 years (adjunctive therapy only) initially 10–15 mg/kg (max. 300 mg) once daily, then increased according to response over 3 days to usual dose 25–35 mg/kg daily in 3 divided doses; max. 50 mg/kg daily in 3 divided doses; CHILD 2–6 years see BNF for Children

• Neuropathic pain, ADULT over 18 years, 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times daily on day 3 or initially 300 mg 3 times daily on day 1, then increased according to response in steps of 300 mg (in 3 divided doses) every 2–3 days up to max. 3.6 g daily

• Migraine prophylaxis [unlicensed], initially 300 mg daily, increased according to response up to 2.4 g daily in divided doses

Gabapentin (non-proprietary) (BNF)

Capsules, gabapentin 100 mg, net price 100-cap pack = £3.57; 300 mg, 100-cap pack = £8.83; 400 mg, 100-cap pack = £5.53. Label: 3, 5, 8, counselling, driving (see notes above)

Tablets, gabapentin 600 mg, net price 100-tab pack = £24.85; 800 mg, 100-tab pack = £36.42. Label: 3, 5, 8, counselling, driving (see notes above)

Neurontin® (Pfizer) (BNF)

Capsules, gabapentin 100 mg (white), net price 100-cap pack = £18.29; 300 mg (yellow), 100-cap pack = £42.40; 400 mg (orange), 100-cap pack = £49.06. Label: 3, 5, 8, counselling, driving (see notes above)

Tablets, 5/c, gabapentin 600 mg, net price 100-tab pack = £84.80; 800 mg, 100-tab pack = £98.13. Label: 3, 5, 8, counselling, driving (see notes above)

Pregabalin

Indications

Peripheral and central neuropathic pain (section 4.7.3); adjunctive therapy for focal seizures with or without secondary generalisation; generalised anxiety disorder (section 4.3)

Caution

Avoid abrupt withdrawal (taper over at least 1 week); severe congestive heart failure; conditions that may precipitate encephalopathy

Renal impairment

Initially 75 mg daily and max. 300 mg daily if eGFR 30–60 mL/minute/1.73 m²; initially 25–50 mg daily and max. 150 mg daily in 1–2 divided doses if eGFR 15–30 mL/minute/1.73 m²; initially 25 mg once daily and max. 75 mg once daily if eGFR less than 15 mL/minute/1.73 m²

Pregnancy

See Pregnancy, p. 280

Breast-feeding

Present in milk in animal studies—manufacturer advises avoid; see also Breast-feeding, p. 280

Side-effects

Dry mouth, constipation, vomiting, flatulence, oedema, dizziness, drowsiness, irritability, impaired attention, disturbances in muscle control and movement, speech disorder, impaired memory, paraesthesia, euphoria, confusion, malaise, appetite changes, insomnia, weight gain, sexual dysfunction, visual disturbances (including blurred vision, diplopia, visual field defects); less commonly: abdominal distension, hypersalivation, gastro-oesophageal reflux disease, thirst, taste disturbance, flushing, hypotension, hypertension, tachycardia, syncope, first-degree AV block, dyspnoea, nasal dryness, stupor, depersonalisation, depression, abnormal dreams, hallucinations, agitation, cognitive impairment, panic
attacks, chills, hypoglycaemia, thrombocytopenia, urinary incontinence, dysuria, myalgia, arthralgia, dry eye, lacrimation, hyperacusis, nasopharyngitis, sweating, rash; rarely ascites, dysphagia, pancreatitis, weight loss, cold extremities, arthralgia, bradycardia, cough, epistaxis, rhinitis, parosmia, hyperglycaemia, renal failure, oligaemia, menstrual disturbances, breast pain, breast discharge, breast hypertrophy, neuropenia, hypokalaemia, leucopenia, rhabdomyolysis, urticaria; also reported diarrhoea, nausea, congestive heart failure, QT-interval prolongation, aggression, headache, convulsions, encephalopathy, urinary retention, keraotis. Stevens-Johnson syndrome, pruritus; suicidal ideation

**Dose**
- Neuropathic pain, **ADULT** over 18 years, initially 150 mg daily in 2–3 divided doses, increased if necessary after 3–7 days to 300 mg daily in 2–3 divided doses, increased further if necessary after 7 days to max. 600 mg daily in 2–3 divided doses
- Epilepsy, **ADULT** over 18 years, initially 25 mg twice daily, increased at 7-day intervals in steps of 50 mg daily to 300 mg daily in 2–3 divided doses, increased further if necessary after 7 days to max 600 mg daily in 2–3 divided doses
- Generalised anxiety disorder, **ADULT** over 18 years, initially 150 mg daily in 2–3 divided doses, increased if necessary at 7-day intervals in steps of 150 mg daily; max. 600 mg daily in 2–3 divided doses

**Note** Pregabalin doses in BNF may differ from those in product literature

**Lyrica®** (Pfizer)  
Capsules, pregabalin 25 mg (white), net price 56-cap pack = £64.40; 48-cap pack = £96.60; 50 mg (white), 84-cap pack = £96.60; 75 mg (white/orange), 56-cap pack = £64.40; 100 mg (orang), 84-cap pack = £96.60; 150 mg (white), 56-cap pack = £64.40; 200 mg (orange), 84-cap pack = £96.60; 225 mg (white/orange), 56-cap pack = £64.40; 300 mg (white/orange), 56-cap pack = £64.40. Label: 3, 8, counselling, driving (see notes above)

**Lacosamide**

Lacosamide is licensed for adjunctive treatment of focal seizures with or without secondary generalisation. The *Scottish Medicines Consortium* (p. 4) has advised (January 2009) that lacosamide *(Vimpat®)* is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

**LACOSAMIDE**

**Indications** see notes above

**Cautions** risk of PR-interval prolongation (including conduction problems, severe cardiac disease, and concomitant use of drugs that prolong PR interval), elderly; **interactions:** Appendix 1 (lacosamide)

**Contra-indications** second- or third-degree AV block

**Hepatic impairment** caution in severe impairment—no information available

**Renal impairment** titrate dose with caution; max. 250 mg daily if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** see Pregnancy, p. 280

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies; see also Breast-feeding, p. 280

**Side-effects** nausea, vomiting, constipation, flatulence, dizziness, headache, impaired coordination, cognitive disorder, drowsiness, tremor, depression, fatigue, abnormal gait, blurred vision, nystagmus, pruritus; also reported dysuria, dry mouth, first-degree AV block, bradycardia, PR-interval prolongation, confusion, hypothesia, dysarthria, irritability, muscle spasm, tinnitus, rash; suicidal ideation

**Dose**
- By intravenous infusion over 15–60 minutes (for up to 5 days) or by mouth, **ADULT** and **CHILD** over 16 years, initially 50 mg twice daily, increased weekly by 50 mg twice daily; max. 200 mg twice daily

**Vimpat®** (UCB Pharma)  
Tablets, f/c, lacosamide 50 mg (pink), net price 14-tab pack = £10.81; 100 mg (yellow), 14-tab pack = £21.62, 56-tab pack = £56.50; 150 mg (pink), 14-tab pack = £32.44, 56-tab pack = £129.74; 200 mg (blue), 56-tab pack = £144.16. Label: 8, counselling, driving (see notes above)

**Syrup**, lacosamide 15 mg/mL, net price 200 mL = £38.61. Label: 8, counselling, driving (see notes above)

**Electrolytes** Na⁺ 0.4 mmol/5 mL

**Excipients** include aspartame (section 9.4.1)

**Intravenous infusion**, lacosamide 10 mg/mL, net price 200-mg vial = £29.70

**Electrolytes** Na⁺ 2.6 mmol/vial

**4.8.1 Control of the epilepsies**

**Breast-feeding**

**Lamotrigine**

Lamotrigine is an antiepileptic for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed for typical absence seizures in children (but efficacy may not be maintained in all children). Lamotrigine may cause serious rashes especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

**LAMOTRIGINE**

**Indications** monotherapy and adjunctive treatment of focal seizures and generalised seizures including tonic-clonic seizures; seizures associated with Lennox-Gastaut syndrome; monotherapy of typical absence seizures in children; prevention of depressive episodes associated with bipolar disorder

**Cautions** closely monitor and consider withdrawal if rash, fever, or other signs of hypersensitivity syndrome develop; avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs; myoclonic seizures (may be exacerbated); Parkinson’s disease (may be exacerbated); **interactions:** see p. 279 and Appendix 1 (lamotrigine)

**Blood disorders** be alert for symptoms and signs suggestive of bone-marrow failure such as anaemia, bruising, or
infection. Aplastic anemia, bone-marrow depression and pancytopenia have been associated rarely with lamotrigine

Hepatic impairment halve dose in moderate impairment, quarter dose in severe impairment

Renal impairment caution in renal failure; metabolite may accumulate; consider reducing maintenance dose in significant impairment

Pregnancy see Pregnancy, p. 280

Breast-feeding present in milk but limited data suggest no harmful effects on infants; see also Breast-feeding, p. 280

Side-effects nausea, vomiting, diarrhoea, dry mouth, aggression, agitation, headache, drowsiness, dizziness, tremor, insomnia, ataxia, back pain, arthralgia, nystagmus, diplopia, blurred vision, rash (see Skin Reactions, below); rarely conjunctivitis, very rarely hepatic failure, aseptic meningitis, movement disorders, unsteadiness, increase in seizure frequency, exacerbation of Parkinson’s disease, confusion, hallucination, blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia—see Blood Disorders, above), hypersensitivity syndrome (possibly including rash, fever, facial oedema, lymphadenopathy, hepatic dysfunction, blood disorders, disseminated intravascular coagulation, and multi-organ dysfunction), lupus erythematosus-like reactions; also reported suicidal ideation

Skin reactions Severe skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed especially in children; most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome (see Side-effects, above) and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

Counselling Warn patients to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop

Dose Important Do not confuse the different combinations or indications; see also notes above

Note Dose titration should be repeated if restarting after an interval of more than 5 days

• Monotherapy of seizures, ADULT and CHILD over 12 years, initially 25 mg once daily for 14 days, increased to 50 mg once daily for further 14 days, then increased by max. 100 mg every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses (up to 500 mg daily has been required)

• Monotherapy of typical absence seizures, CHILD 2–12 years see BNF for Children

• Adjunctive therapy of seizures with valproate, ADULT and CHILD over 12 years, initially 25 mg on alternate days for 14 days then 25 mg once daily for further 14 days, thereafter increased by max. 50 mg every 7–14 days; usual maintenance, 100–200 mg daily in 1–2 divided doses; CHILD 2–12 years initially 150 micrograms/kg once daily for 14 days (those under 13 kg may receive 2 mg on alternate days for first 14 days) then 300 micrograms/kg once daily for further 14 days, thereafter increased by max. 300 micrograms/kg every 7–14 days; usual maintenance 1–5 mg/kg daily in 1–2 divided doses (max. single dose 100 mg)

• Adjunctive therapy of seizures (with enzyme inducing drugs) without valproate, ADULT and CHILD over 12 years, initially 50 mg once daily for 14 days then 50 mg twice daily for further 14 days, thereafter increased by max. 100 mg every 7–14 days; usual maintenance 200–400 mg daily in 2 divided doses (up to 700 mg daily has been required); CHILD 2–12 years initially 600 micrograms/kg daily in 2 divided doses for 14 days then 1.2 mg/kg daily in 2 divided doses for further 14 days, thereafter increased by max. 1.2 mg/kg every 7–14 days; usual maintenance 5–15 mg/kg daily in 2 divided doses (max. single dose 200 mg)

• Adjunctive therapy of seizures (without enzyme inducing drugs) without valproate, ADULT and CHILD over 12 years, initially 25 mg once daily for 14 days, increased to 50 mg once daily for further 14 days, then increased by max. 100 mg every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses; CHILD 2–12 years initially 300 micrograms/kg daily in 1–2 divided doses for 14 days then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, thereafter increased by max. 600 micrograms/kg every 7–14 days; usual maintenance 1–10 mg/kg daily in 1–2 divided doses; max. 200 mg daily

• Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate, ADULT over 18 years, initially 25 mg once daily for 14 days, then 50 mg daily in 1–2 divided doses for further 14 days, then 100 mg daily in 1–2 divided doses for further 7 days; usual maintenance 200 mg daily in 1–2 divided doses; max. 400 mg daily

• Adjunctive therapy of bipolar disorder with valproate, ADULT over 18 years, initially 25 mg on alternate days for 14 days, then 25 mg once daily for further 14 days, then 50 mg daily in 1–2 divided doses for further 7 days; usual maintenance 100 mg daily in 1–2 divided doses; max. 200 mg daily

• Adjunctive therapy of bipolar disorder (with enzyme inducing drugs) without valproate, ADULT over 18 years, initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then 100 mg twice daily for further 7 days, then 150 mg twice daily for further 7 days; usual maintenance 200 mg twice daily

Note Patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature

Lamotrigine (Non-proprietary) ▼ (Tab)

Tablets, lamotrigine 25 mg, net price 56-tab pack = £2.25; 50 mg, 56-tab pack = £3.07; 100 mg, 56-tab pack = £4.53; 200 mg, 30-tab pack = £27.53, 56-tab pack = £7.51. Label: 8, counselling, driving (see notes above), skin reactions (see above)

Dispersible tablets, lamotrigine 5 mg, net price 28-tab pack = £2.27; 25 mg, 56-tab pack = £2.91; 100 mg, 56-tab pack = £5.86. Label: 8, 13, counselling, driving (see notes above), skin reactions (see above)

Lamictal® (GSK) ▼ (Tab)

Tablets, yellow, lamotrigine 25 mg, net price 56-tab pack = £19.61; 50 mg, 56-tab pack = £33.35; 100 mg, 56-tab pack = £57.53; 200 mg, 56-tab pack = £97.79. Label: 8, counselling, driving (see notes above), skin reactions (above)

Dispersible tablets, chewable, lamotrigine 2 mg, net price 30-tab pack = £10.45; 5 mg, 28-tab pack = £7.82; 25 mg, 56-tab pack = £19.61; 100 mg, 56-tab pack = £57.53. Label: 8, 13, counselling, driving (see notes above), skin reactions (above)
**LEVETIRACETAM**

**Indications** see notes above

**Cautions** avoid abrupt withdrawal; interactions:
- Appendix 1 (levetiracetam)
- Hepatic impairment halve dose in severe hepatic impairment if eGFR less than 60 mL/minute/1.73 m²
- Renal impairment max. 2 g daily if eGFR 50–80 mL/minute/1.73 m²; max. 1.5 g daily if eGFR 30–50 mL/minute/1.73 m²; max. 1 g daily if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** see Pregnancy, p. 280

**Breast-feeding** present in milk—manufacturer advises avoid; see also Breast-feeding, p. 280

**Side-effects** anorexia, weight changes, abdominal pain, nausea, vomiting, dyspepsia, diarrhoea, cough, drowsiness, amnesia, ataxia, confusion, dizziness, headache, tremor, hyperkinesia, malaise, impaired attention, aggression, agitation, depression, insomnia, anxiety, irritability, personality disorder, thrombocytopenia, myalgia, diplopia, blurred vision, rash; also reported pancreatitis, hepatic failure, paraesthesia, confusion, psychosis, suicidal ideation, leucopenia, neutropenia, pancytopenia, alopecia, toxic epidermal necrolysis, Stevens-Johnson syndrome

**Dose**

- Monotherapy of focal seizures with or without secondary generalisation, by mouth or by intravenous infusion, ADULT and CHILD over 12 years, body-weight over 50 kg, initially 250 mg twice daily, adjusted in steps of 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily; CHILD over 6 months, body-weight under 50 kg, initially 10 mg/kg once daily, adjusted in steps not exceeding 10 mg/kg twice daily every 2 weeks; max. 50 mg/kg twice daily; CHILD 1–6 months, initially 7 mg/kg once daily, adjusted in steps not exceeding 7 mg/kg twice daily every 2 weeks; max. 21 mg/kg twice daily

- Adjuvant therapy of focal seizures with or without secondary generalisation, by mouth, ADULT and CHILD over 12 years, body-weight over 50 kg, initially 250 mg twice daily, adjusted in steps of 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily; CHILD over 4 years, body-weight under 50 kg, initially 10 mg/kg once daily, adjusted in steps not exceeding 10 mg/kg twice daily every 2 weeks; max. 30 mg/kg twice daily

- By intravenous infusion, ADULT and CHILD over 12 years, body-weight over 50 kg, initially 250 mg twice daily, adjusted in steps of 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily; CHILD over 4 years, body-weight under 50 kg, initially 10 mg/kg once daily, adjusted in steps not exceeding 10 mg/kg twice daily every 2 weeks; max. 50 mg/kg twice daily

- Adjuvant therapy of myoclonic seizures and tonic-clonic seizures, by mouth or by intravenous infusion, ADULT and CHILD over 12 years, body-weight over 50 kg, initially 250 mg twice daily, adjusted in steps of 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily; CHILD 12–18 years, body-weight under 50 kg, initially 10 mg/kg once daily, adjusted in steps not exceeding 10 mg/kg twice daily every 2 weeks; max. 30 mg/kg twice daily

- If switching from oral to intravenous therapy (because oral route temporarily unavailable), by intravenous infusion, same as established oral dose

**Note** Lefetiracetam doses in BNF may differ from those in product literature

**Keppra®** (UCB Pharma) Tablets, 1/c, levetiracetam 250 mg (blue), net price 60-tab pack = £29.70; 500 mg (yellow), 60-tab pack = £52.30; 750 mg (orange) 60-tab pack = £89.10; 1 g (white), 60-tab pack = £103.10. Label: 8

Oral solution, sugar-free, levetiracetam 100 mg/mL, net price 150 mL (with 1 mL or 3 mL syringe) = £42.60, 300 mL = £71.00. Label: 8

Concentrate for intravenous infusion, levetiracetam 100 mg/mL, net price 5-mL vial = £13.50

**Electrolytes** Na⁺ 0.83 mmol/vial

**Note** For dilution before use

---

**Phenobarbital and other barbiturates**

Phenobarbital is effective for tonic-clonic and focal seizures but may be sedative in adults and cause behavioural disturbances and hyperkinesia in children. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal. For therapeutic purposes phenobarbital and phenobarbital sodium should be considered equivalent in effect. Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre); however, monitoring the plasma concentration is less useful than with other drugs because tolerance occurs.

Primidone is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential, and the drug should be introduced over several weeks.

---

**PHENOBARBITAL** (Phenobarbitone)

**Indications** all forms of epilepsy except typical absence seizures; status epilepticus (section 4.8.2)

**Cautions** see notes above; elderly; debilitated; children; respiratory depression (avoid if severe); avoid abrupt withdrawal (dependence with prolonged use); history of drug or alcohol abuse; consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium; avoid in acute porphyria (section 9.8.2); interactions: see p. 279 and Appendix 1 (barbiturates)

**Hepatic impairment** may precipitate coma; avoid in severe impairment

**Renal impairment** use with caution

**Pregnancy** see Pregnancy, p. 280

**Breast-feeding** avoid if possible; drowsiness may occur; see also Breast-feeding, p. 280

**Side-effects** hepatitis, cholestasis; hypotension; respiratory depression; behavioural disturbances, nystagmus, irritability, drowsiness, lethargy, depression, ataxia, paradoxical excitement, hallucinations, impaired memory and cognition, hyperactivity particularly in the elderly and in children; osteomalacia (see Cautions); megaloblastic anaemia (may be treated with folic acid); agranulocytosis, thrombocytopenia; allergic skin reactions; very rarely Stevens-John-
Central nervous system

Phenobarbital

Phenytoin is effective for tonic-clonic and focal seizures. It has a narrow therapeutic index and the relationship between dose and plasma concentration is nonlinear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma concentration. Monitoring of plasma concentration improves dosage adjustment. Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

Phenytoin may cause coarsening of the facial appearance, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients. When only parenteral administration is possible, fosphenytoin (section 4.8.2), a pro-drug of phenytoin, may be convenient to give. Whereas phenytoin can be given intravenously only, fosphenytoin may also be given by intramuscular injection.

Phenytoin

Indications all forms of epilepsy except absence seizures; status epilepticus (section 4.8.2); trigeminal neuralgia if carbamazepine inappropriate (see also section 4.7.3)

Cautions cross-sensitivity reported with carbamazepine; avoid abrupt withdrawal; HLA-B*1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome); manufacturer recommends blood counts (but evidence of practical value uncertain); consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium; enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary); avoid in acute porphyria (section 9.8.2); interactions: see p. 279 and Appendix 1 (phenytoin)

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative)

Hepatic impairment reduce dose to avoid toxicity

Pregnancy changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction; see also Pregnancy, p. 280

Breast-feeding small amount present in milk, but not known to be harmful; see also Breast-feeding, p. 280

Side-effects nausea, vomiting, constipation, drowsiness, insomnia, transient nervousness, tremor, paraesthesia, dizziness, headache, anorexia; rarely psychosis, lupus erythematosus, arthralgia; also reported Dupuytren's contracture

Dose

• Epilepsy. ADULT and CHILD over 9 years, initially 125 mg daily at bedtime, increased by 125 mg every 3 days to 500 mg daily in 2 divided doses, then increased according to response by 250 mg every 3 days to usual maintenance 0.75–1.5 g daily in 2 divided doses; CHILD under 9 years, initially 125 mg daily at bedtime, increased by 125 mg every 3 days according to response; usual maintenance. CHILD under 2 years, 250–500 mg daily in 2 divided doses; 2–5 years, 500–750 mg daily in 2 divided doses; 5–9 years 0.75–1 g daily in 2 divided doses

• Essential tremor, initially 50 mg daily increased gradually over 2–3 weeks according to response; max. 750 mg daily

Note Monitor plasma concentrations of derived phenobarbital; optimum range as for phenobarbital.

Mysoline® (Acorus) Tablets, scored, primidone 50 mg, net price 100–tab pack = £12.60; 250 mg, 100-tab pack = £12.60. Label: 2, 8, counselling, driving (see notes above)

Phenobarbital (Non-proprietary)

By mouth, 5–8 mg/kg daily

Tablets, phenobarbital 15 mg, net price 28-tab pack = 95p; 30 mg, 28-tab pack = 96p; 60 mg, 28-tab pack = 71p. Label: 2, 8, counselling, driving (see notes above)

Note Some hospitals supply alcohol-free formulations of varying phenobarbital strengths

Injection

Section 4.8.2

PHENYTOIN

Indications all forms of epilepsy except absence seizures; status epilepticus (section 4.8.2); trigeminal neuralgia if carbamazepine inappropriate (see also section 4.7.3)

Cautions cross-sensitivity reported with carbamazepine; avoid abrupt withdrawal; HLA-B*1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome); manufacturer recommends blood counts (but evidence of practical value uncertain); consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium; enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary); avoid in acute porphyria (section 9.8.2); interactions: see p. 279 and Appendix 1 (phenytoin)

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative)

Hepatic impairment reduce dose to avoid toxicity

Pregnancy changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction; see also Pregnancy, p. 280

Breast-feeding small amount present in milk, but not known to be harmful; see also Breast-feeding, p. 280

Side-effects nausea, vomiting, constipation, drowsiness, insomnia, transient nervousness, tremor, paraesthesia, dizziness, headache, anorexia; rarely psychosis, lupus erythematosus, arthralgia; also reported Dupuytren's contracture

Dose

• By mouth, initially 3–4 mg/kg daily or 150–300 mg daily (as a single dose or in 2 divided doses) increased gradually as necessary (with plasma-phenytoin concentration monitoring); usual dose 200–500 mg daily (exceptionally, higher doses may be used); CHILD initially 5 mg/kg daily in 2 divided doses, usual dose range 4–8 mg/kg daily (max. 300 mg daily)

Note Plasma concentration for optimum response 10–20 mg/litre (40–80 micromol/litre)

Counselling Take preferably with or after food
Phenytoin (Non-proprietary) 

Tablets, coated, phenytoin sodium 100 mg, net price 28-tab pack = £30.00. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)  

Note On the basis of single dose tests there are no clinically relevant differences in bioavailability between available phenytoin sodium tablets and capsules but there may be a pharmacokinetic basis for maintaining the same brand of phenytoin in some patients  

Epanutin® (Pfizer) 

Capsules, phenytoin sodium 25 mg (white/purple), net price 28-cap pack = 66p; 50 mg (white/pink), 28-cap pack = 67p; 100 mg (white/orange), 84-cap pack = £2.83; 300 mg (white/green), 28-cap pack = £2.83. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)  

Chewable tablets (Infatabs®), yellow, scored, phenytoin 50 mg, net price 112 = £7.38. Label: 8, 24, counselling, blood or skin disorder symptoms (see above), driving (see notes above)  

Note Contain phenytoin 50 mg (as against phenytoin sodium) therefore care is needed on changing to capsules or tablets containing phenytoin sodium  

Suspension, red, phenytoin 30 mg/5 mL, net price 500 mL = £4.27. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)  

Note Suspension of phenytoin 90 mg in 15 mL may be considered to be approximately equivalent in therapeutic effect to capsules or tablets containing phenytoin sodium 100 mg, but nevertheless care is needed in making changes

4.8.1 Control of the epilepsies

Rufinamide

Rufinamide is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. The Scottish Medicines Consortium (p. 4) has advised (October 2008) that rufinamide (Inovelon®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

Indications see notes above  

Cautions closely monitor and consider withdrawal if rash, fever, or other signs of hypersensitivity syndrome develop; avoid abrupt withdrawal; interactions: see p. 279 and Appendix 1 (rufinamide)  

Hepatic impairment caution and careful dose titration in mild to moderate impairment; avoid in severe impairment  

Pregnancy see Pregnancy, p. 280  

Breast-feeding manufacturer advises avoid—no information available; see also Breast-feeding, p. 280  

Side-effects nausea, vomiting, constipation, diarrhoea, dyspepsia, abdominal pain, weight loss, anaemia, rhabdomyolysis, dizziness, headache, drowsiness, insomnia, anxiety, fatigue, increase in seizure frequency, impaired coordination, hyperactivity, tremor, gait disturbances; influenza-like symptoms; oligomenorrhea; back pain; myalgia, diaphorosis, blurred vision; rash and acne; hypersensitivity syndrome (possibly including rash, fever, lymphade-nopathy, hepatic dysfunction, haematuria, and multi-organ dysfunction) also reported

Hypersensitivity syndrome Serious hypersensitivity syndrome (see Side-effects) has developed, especially in children and upon initiation of therapy; consider withdrawal if rash or signs of hypersensitivity syndrome develop  

Counselling Warn patients to seek immediate medical attention if signs or symptoms of hypersensitivity develop

Dose

- ADULT and CHILD over 4 years body-weight over 30 kg, initially 200 mg twice daily increased according to response in steps of 200 mg twice daily at intervals of not less than 2 days; body-weight 30–50 kg max. 900 mg twice daily; body-weight 50–70 kg max. 1.2 g twice daily; body-weight over 70 kg max. 1.6 g twice daily; CHILD over 4 years body-weight less than 30 kg, initially 100 mg twice daily increased according to response in steps of 100 mg twice daily at intervals of not less than 2 days; max. 500 mg twice daily (max. 300 mg twice daily if adjunctive therapy with valproate)  

Inovelon® (Eisai) Tablets, pink, f/c, scored, rufinamide 100 mg, net price10-tab pack = £5.15; 200 mg, 60-tab pack = £61.77; 400 mg, 60-tab pack = £102.96. Label: 21, counselling, driving (see notes above), hypersensitivity syndrome (see above)

Tiagabine

Tiagabine is used as adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics.

Indications see notes above  

Cautions avoid in acute porphyria (section 9.8.2); avoid abrupt withdrawal; interactions: Appendix 1 (tiagabine)  

Driving May impair performance of skilled tasks (e.g. driving)  

Hepatic impairment maintenance dose 5–10 mg 1–2 times daily initially in mild to moderate impairment; avoid in severe impairment  

Pregnancy see Pregnancy, p. 280  

Breast-feeding manufacturer advises use only if potential benefit outweighs risk; see also Breast-feeding, p. 280  

Side-effects diarrhoea; dizziness, tiredness, nervousness, tremor, impeded concentration, emotional lability, speech impairment; rarely confusion, depression, drowsiness, psychosis, non-convulsive status epilepticus, bruising, and visual disturbances; suicidal ideation; leucopenia also reported

Dose

- Adjunctive therapy, ADULT and CHILD over 12 years, with enzyme-inducing drugs, 5 mg twice daily for 1 week, then increased at weekly intervals in steps of 5–10 mg daily; usual maintenance dose 30–45 mg daily (doses above 30 mg given in 5 divided doses); in patients receiving non-enzyme-inducing drugs, initial maintenance dose 15–30 mg daily
Topiramate
Topiramate can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome. Topiramate is also licensed for prophylaxis of migraine (section 4.7.4.2).

**Indications** see notes above

**Cautions** avoid abrupt withdrawal; risk of metabolic acidosis; risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment); avoid in acute porphyria (section 9.8.2);

**interactions:** see p. 279 and Appendix 1 (topiramate)

**Important** Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intra-ocular pressure occurs:

- seek specialist ophthalmological advice;
- use appropriate measures to reduce intra-ocular pressure;
- stop topiramate as rapidly as feasible

**Hepatic impairment** use with caution in moderate to severe impairment—clearance may be reduced

**Renal impairment** use with caution if eGFR less than 60 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration

**Pregnancy** see Pregnancy, p. 280

**Breastfeeding** manufacturer advises avoid—present in milk; see also Breast-feeding, p. 280

**Side-effects** nausea, diarrhoea, vomiting, constipation, myopia, abdominal pain, dry mouth, taste disturbance, gastritis, appetite changes, dry eye, photophobia, blepharospasm, increased lacrimation, mydriasis, hearing loss, reduced sweating, skin discoloration; rarely Raynaud’s syndrome, periorbital oedema, unilateral blindness, Stevens-Johnson syndrome, abnormal skin odour, calcinosis; very rarely angle-closure glaucoma; also reported maculopathy, toxic epidermal necrolysis

**Dose**

- Monotherapy, initially 25 mg at night for 1 week then increased in steps of 25–50 mg taken in 2 divided doses at intervals of 1–2 weeks; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response; max. 500 mg daily (doses of 1 g daily have been used in refractory epilepsy); CHILD 6–18 years, initially 0.5–1 mg/kg (max. 25 mg) at night for 1 week then increased in steps of 0.5–1 mg/kg taken in 2 divided doses at intervals of 1–2 weeks; initial target dose 100 mg daily in 2 divided doses; max. 15 mg/kg (max. 500 mg) daily

- Adjunctive therapy, initially 25–50 mg at night for 1 week then increased in steps of 25–50 mg taken in 2 divided doses at intervals of 1–2 weeks; usual dose 200–400 mg daily in 2 divided doses; max. 400 mg daily; CHILD 2–18 years, initially 1–3 mg/kg (max. 25 mg) at night for 1 week then increased in steps of 1–3 mg/kg (max. 50 mg) taken in 2 divided doses at intervals of 1–2 weeks; usual dose 5–9 mg/kg daily in 2 divided doses; max. 15 mg/kg (max. 400 mg) daily

- Migraine prophylaxis, ADULT, initially 25 mg daily at night for 1 week then increased in steps of 25 mg at intervals of 1 week; usual dose 50–100 mg daily in 2 divided doses; max. 200 mg daily

**Topiramate (Non-proprietary)**

**Tablets**, topiramate 25 mg, net price 60-tab pack = £6.17; 50 mg, 60-tab pack = £10.74; 100 mg, 60-tab pack = £12.52; 200 mg, 60-tab pack = £17.21. Label: 3, 8, counselling, driving (see notes above)

**Capsules**, topiramate 15 mg, net price 60-cap pack = £16.61; 25 mg, 60-cap pack = £24.91; 50 mg, 60-cap pack = £40.93. Label: 3, 8, counselling, driving (see notes above)

**Topamax® (Janssen-Cilag)**

**Tablets**, f/c, topiramate 25 mg, net price 60-tab pack = £19.29; 50 mg (light yellow), 60-tab pack = £31.69; 100 mg (yellow), 60-tab pack = £56.76; 200 mg (salmon), 60-tab pack = £110.23. Label: 3, 8, counselling, driving (see notes above)

**Capsules** (Sprinkle®), topiramate 15 mg, net price 60-cap pack = £14.79; 25 mg, 60-cap pack = £22.18; 50 mg, 60-cap pack = £36.45. Label: 3, 8, counselling, administration, driving (see notes above)

**Counselling** Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing

**Valproate**

Sodium valproate is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised epilepsy, generalised absences and myoclonic seizures, and can be tried in atypical absence, tonic, and tonic seizures. Sodium valproate has widespread metabolic effects and monitoring is essential (see Cautions below).

**Valproic acid** (as semisodium valproate) (section 4.2.3) is licensed for acute mania associated with bipolar disorder.
SODIUM VALPROATE

**Indications**  all forms of epilepsy; migraine prophylaxis [unlicensed] (section 4.7.4.2).

**Cautions**  monitor liver function before therapy and during first 6 months especially in patients most at risk (see also below); measure full blood count and ensure no undue potential for bleeding before starting and before surgery; systemic lupus erythematosus; false-positive urine tests for ketones; avoid abrupt withdrawal; consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium; interactions: see p. 279 and Appendix 1 (valproate).

**Liver toxicity**  Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

**Blood or hepatic disorders**  Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

**Pancreatitis**  Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop; discontinue if pancreatitis is diagnosed.

**Contra-indications**  family history of severe hepatic dysfunction; acute porphyria (section 9.8.2).

**Hepatic impairment**  avoid if possible—haptototoxicity and hepatic failure may occasionally occur (usually in first 6 months); avoid in active liver disease; see also under Cautions.

**Renal impairment**  reduce dose; adjust dosage according to free serum-valproic acid concentration.

**Pregnancy**  see Pregnancy, p. 280; neonatal bleeding (related to hyophosphinemia) and neonatal hepatotoxicity also reported.

**Breast-feeding**  amount too small to be harmful; see also Breast-feeding, p. 280.

**Side-effects**  nausea, gastric irritation, diarrhoea; weight gain; hyperammonaemia, thyrocytopenia; transient hair loss (regrowth may be curly); less frequently increased alertness, aggression, hyperactivity, behavioural disturbances, ataxia, tremor, and vasculitis; rarely hepatic dysfunction (see under Cautions); withdrawal treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control), lethargy, drowsiness, confusion, stupor, hallucinations, blood disorders (including anaemia, leucopenia, pancytopenia), hearing loss, and rash; very rarely pancreatitis (see under Cautions); peripheral oedema, increase in bleeding time, extrapyramidal symptoms, dementia, encephalopathy, coma, gynaecomastia, Fanconi's syndrome, hirsutism, acne, enuresis, hypoprolactinaemia, toxic epidermal necrolysis, and Stevens-Johnson syndrome; suicidal ideation; reduced bone mineral density (see Cautions); also reported menstrual disturbances.

**Dose**

- **Epilepsy, by mouth**  initially 600 mg daily in 1–2 divided doses, increased by 200 mg daily every 3 days; usual maintenance dose 1–2 g daily (20–30 mg/kg daily), max. 2.5 g daily; **CHILD** body-weight up to 20 kg, initially 20 mg/kg daily in 1–2 divided doses, increased according to response (dose above 40 mg/kg daily monitor clinical chemistry and haematological parameters); **CHILD** under 12 years body-weight over 20 kg, initially 400 mg daily in 1–2 divided doses increased according to response; usual maintenance dose 20–30 mg/kg daily, max. 35 mg/kg daily.

- **Initiation of valproate treatment, by intravenous injection**  (over 3–5 minutes), up to 10 mg/kg (usually 400–800 mg) followed by **intravenous infusion** up to max. 2.5 g daily; **CHILD** under 12 years, usually 20–30 mg/kg daily, increased according to response (dose above 40 mg/kg daily monitor clinical chemistry and haematological parameters).

Continuation of valproate treatment by **intravenous injection**  (over 3–5 minutes) in 2 divided doses or by **intravenous infusion**, same as established oral dose.

- **Migraine prophylaxis** [unlicensed], by mouth, initially 200 mg twice daily, increased if necessary to 1.2–1.5 g daily in divided doses.

### Oral

**Sodium Valproate**  (Non-proprietary)

- **Tablets** (crushable, scored, sodium valproate 100 mg, net price 100-tab pack = £5.60. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above).

- **Tablets**, e/c, sodium valproate 200 mg, net price 100-tab pack = £4.85, 500 mg, 100-tab pack = £10.09. Label: 5, 8, 25, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above).

**Brands include**  Orilix®

- **Oral solution**, sodium valproate 200 mg/5 mL, net price 300 mL = £5.42. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above).

**Brands include**  Orilix®  (sugar-free).

**Epilim**  (Sanofi-Aventis)

- **Tablets** (crushable, scored, sodium valproate 100 mg, net price 100 = £5.60. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above).

- **Tablets**, e/c, iliac, sodium valproate 200 mg, net price 100 = £7.70, 500 mg, 100 = £19.25. Label: 5, 8, 25, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above).

**Liquid**, red, sugar-free, sodium valproate 200 mg/5 mL, net price 300 mL = £5.42. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above).

**Epilim**, red, sodium valproate 200 mg/5 mL, net price 300-mL pack = £9.33. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above).

**Note**  May be diluted, preferably in Syrup BP, use within 14 days.

**Modified release**

**Epilim Chrono**  (Sanofi-Aventis)

- **Tablets**, m/t, iliac, sodium valproate 200 mg (as sodium valproate and valproic acid), net price 100-tab pack = £11.65, 300 mg, 100-tab pack = £17.47, 500 mg, 100-tab pack = £29.10. Label: 8, 21, 25,
counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

**Dose**

**ADULT** and **CHILD** over 20 kg, as above, total daily dose given in 1–2 divided doses

### Epilim Chronosphere® (Sanofi-Aventis) (Beacon)

**Granules**, m/r, sodium valproate 50 mg (as sodium valproate and valproic acid), net price 30-sachet pack = £30.00; 100 mg, 30-sachet pack = £30.00; 250 mg, 30-sachet pack = £30.00; 500 mg, 30-sachet pack = £30.00; 750 mg, 30-sachet pack = £30.00; 1000 mg, 30-sachet pack = £30.00. Label: 8, 21, 25, counselling, administration, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

**Dose**

**ADULT** and **CHILD** as above to the nearest whole 50-mg sachet; total daily dose given in 1–2 divided doses

**Counselling**

Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing

### Convulex® (Pharmacia) (Sanofi-Aventis)

**Capsules**, e/c, valproic acid 150 mg, net price 100-cap pack = £3.68; 300 mg, 100-cap pack = £7.35; 500 mg, 100-cap pack = £12.25. Label: 8, 21, 25, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

**Dose**

**ADULT** and **CHILD** over 12 years, initially 600 mg daily in 2–4 divided doses; increased by 300 mg every 3 days to max. 2.5 g daily; usual maintenance dose 1–2 g daily (30–60 mg/kg daily)

**CHILD** body-weight up to 20 kg, initially 20 mg/kg daily in 2–4 divided doses, increased according to response (dose above 60 mg/kg daily monitor clinical chemistry and haematological parameters). **CHILD** body-weight over 20 kg, initially 300 mg daily in 2–4 divided doses increased according to response

**Equivalence to sodium valproate**

Convulex® has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching

### DepoKote® (Sanofi-Aventis) (Beacon)

Section 4.2.3 (bipolar disorder)

---

**Vigabatrin**

Vigabatrin can be prescribed in combination with other antiepileptic treatment for focal epilepsy with or without secondary generalisation. It should not be prescribed unless all other appropriate drug combinations are ineffective or have not been tolerated, and it should be initiated and supervised by an appropriate specialist.

Vigabatrin can be prescribed as monotherapy in the management of infantile spasms in West’s syndrome.

About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required (see also Visual Field Defects under Cautions below). Vigabatrin has prominent behavioural side-effects in some patients.

---

**Indications**

see notes above

**Cautions**

elderly; closely monitor neurological function; avoid sudden withdrawal (taper off over 2–4 weeks); history of psychosis, depression or behavioural problems; absence seizures (may be exacerbated); interactions: see p. 279 and Appendix 1 (vigabatrin)

**Visual field defects** Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

**Contra-indications**

visual field defects

Renal impairment consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m²

**Pregnancy** see Pregnancy, p. 280

**Breast-feeding** present in milk—manufacturer advises avoid; see also Breast-feeding, p. 280

**Side-effects**

nausea, abdominal pain; oedema; drowsiness (rarely encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG—reduce dose or withdraw), fatigue, excitement (in children), agitation, dizziness, headache, nervousness, depression, aggression, irritability, paranoia, impaired concentration, impaired memory, tremor, paraesthesia, speech disorder, weight gain; visual field defects (see under Cautions), blurred vision, nystagmus, diplopia; less commonly ataxia, psychosis, mania, and rash; occasional increase in seizure frequency (especially if myoclonic); rarely suicidal ideation and retinal disorders (including peripheral retinal neuropathy); very rarely hepatitis, optic neuritis, and optic atrophy, also reported movement disorders in infantile spasms

**Dose**

- With current antiepileptic therapy, initially 1 g daily in single or 2 divided doses then increased according to response in steps of 500 mg at weekly intervals; usual range 2–3 g daily (max. 3 g daily); **CHILD** initially 40 mg/kg daily in single or 2 divided doses then adjusted according to body-weight 10–15 kg, 0.5–1 g daily; body-weight 15–30 kg, 1–1.5 g daily; body-weight 30–50 kg, 1.5–3 g daily; body-weight over 50 kg, 2–3 g daily
Zonisamide

Zonisamide can be used as adjunctive treatment for refractory focal seizures with or without secondary generalisation.

**ZONISAMIDE**

**Indications** see notes above

**Cautions** elderly; ensure adequate hydration (especially if predisposition to nephrolithiasis or in strenuous activity or warm environment); concomitant use of drugs that increase risk of hyperthermia or nephrolithiasis; metabolic acidosis (consider dose reduction or discontinuation); avoid abrupt withdrawal; **interactions:** see p. 279 and Appendix 1 (zonisamide)

**Contra-indications** hypersensitivity to sulfonamides

**Hepatic impairment** initially increase dose at 2-week intervals if mild or moderate impairment; avoid in severe impairment

**Renal impairment** initially increase dose at 2-week intervals; discontinue if renal function deteriorates

**Pregnancy** see Pregnancy, p. 280

**Breast-feeding** manufacturer advises avoid for 4 weeks after administration; see also Breast-feeding, p. 280

**Side-effects** nausea, diarrhoea, abdominal pain, constipation, dyspepsia, anorexia, weight loss; drowsiness, dizziness, confusion, agitation, irritability, depression, psychosis, ataxia, speech disorder, impaired memory and attention, fatigue, myasthenia, paraesthesia, tremor, pyrexia, insomnia; diplopia; ecchymosis; rash (consider withdrawal); less commonly vomiting, cholelithiasis, cholecystitis, agression, suicidal ideation, seizures, pneumonia, urinary tract infection, urinary calculus, and hypokalaemia; very rarely hepatitis, pancreatitis, aspiration, dyspnoea, hallucinations, amnesia, coma, myasthenic syndrome, neuromuscular malignant syndrome, heat stroke, hyponatraemia, renal failure, metabolic acidosis, renal tubular acidosis, blood disorders, rhabdomyolysis, impaired sweating, pruritus, Stevens-Johnson syndrome, and toxic epidermal necrolysis

**Dose**

- **ADULT** over 18 years, initially 50 mg daily in 2 divided doses, increased after 7 days to 100 mg daily in 2 divided doses; then increase if necessary by 100 mg every 7 days; usual maintenance 300–500 mg daily in 1–2 divided doses

4.8.1 Control of the epilepsies

**Zonegran** (Eisai) ▼ (TM)

Capsules, zonisamide 25 mg (white), net price 14-cap pack = £8.82; 50 mg (white/grey), 56-cap pack = £47.04; 100 mg (white/red), 56-cap pack = £62.72. Label: 3

**Benzodiazepines**

Clobazam may be used as adjunctive therapy in the treatment of epilepsy. **Clonazepam** is occasionally used in tonic-clonic or focal seizures, but its sedative side-effects may be prominent.

The effectiveness of clobazam and clonazepam may decrease significantly after weeks or months of continuous therapy.

**CLOBAZAM**

**Indications** adjunct in epilepsy; anxiety (short-term use)

**Cautions** see Diazepam, section 4.1.2

**Contra-indications** see Diazepam, section 4.1.2

**Hepatic impairment** see Benzodiazepines, section 4.1.2

**Renal impairment** see Benzodiazepines, section 4.1.2

**Pregnancy** see Benzodiazepines, section 4.1.2

**Breast-feeding** see Benzodiazepines, section 4.1.2

**Side-effects** see Diazepam, section 4.1.2

**Dose**

- Epilepsy, 20–30 mg daily; max. 60 mg daily; **CHILD** over 3 years, not more than half adult dose
- Anxiety, 20–30 mg daily in divided doses or as a single dose at bedtime, increased in severe anxiety (in hospital patients) to a max. of 60 mg daily in divided doses; **ELDERLY** (or debilitated) 10–20 mg daily

1. Clobazam (Non-proprietary) ▼ (TM)

**Tablets**, clobazam 10 mg. Net price 30-tab pack = £4.68. Label: 2 or 19, 8, counselling, driving (see notes above)

Brands include: **Frisium** ▼ (TM)

1. ▼ except for epilepsy and endorsed ‘SLS’

**CLONAZEPAM**

**Indications** all forms of epilepsy; myoclonus; status epilepticus (section 4.8.2)

**Cautions** see notes above; elderly and debilitated, respiratory disease, spinal or cerebellar ataxia; history of alcohol or drug abuse, depression or suicidal ideation; avoid sudden withdrawal; myasthenia gravis (avoid if unstable); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (anxiolytics and hypnotics)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** respiratory depression; acute pulmonary insufficiency; sleep apnoea syndrome; marked neuromuscular respiratory weakness including unstable myasthenia gravis

**Hepatic impairment** see Benzodiazepines, section 4.1.2

**Renal impairment** see Benzodiazepines, section 4.1.2

**Pregnancy** see Benzodiazepines, section 4.1.2

**Breast-feeding** see Benzodiazepines, section 4.1.2
Central nervous system

4.8.2 Drugs used in status epilepticus

**Side-effects** drowsiness, fatigue, dizziness, muscle hypotonia, co-ordination disturbances; also poor concentration, restlessness, confusion, amnesia, dependence, and withdrawal; salivary or bronchial hypersecretion in infants and small children; rarely gastro-intestinal symptoms, respiratory depression, headache, paradoxical effects including aggression and anxiety, sexual dysfunction, urinary incontinence, urticaria, pruritus, reversible hair loss, skin pigmentation changes; dysartha, and visual disturbances on long-term treatment; blood disorders reported; suicidal ideation; **overdose** see Emergency Treatment of Poisoning, p. 37

**Dose**
- 1 mg (Elderly 500 micrograms) initially at night for 4 nights, increased according to response over 2–4 weeks to usual maintenance dose of 4–8 mg usually at night (may be given in 3–4 divided doses if necessary);
- Child up to 1 year, initially 250 micrograms increased as above to usual maintenance dose of 0.5–1 mg; 1–5 years, initially 250 micrograms increased as above to 1–3 mg; 5–12 years, initially 500 micrograms increased as above to 3–6 mg

**Note** Clonazepam doses in BNF may differ from those in product literature

**Rivotril** (Roche) 2 mg

**Tablets**, both scored, clonazepam 500 micrograms (beige), net price 100-tab pack = £3.69; 2 mg (white), 100-tab pack = £4.93. Label: 2, 8, counselling, driving (see notes above)

**Injection**, section 4.8.2

**Other drugs**

**Acetazolamide** (section 11.6), a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. It can also be used with other antiepileptics for refractory tonic-clonic, absence, and focal seizures. It is occasionally helpful in atypical absence, atomic, and tonic seizures.

**Piracetam** (section 4.9.3) is used as adjunctive treatment for cortical myoclonus.

4.8.2 Drugs used in status epilepticus

**Convulsive status epilepticus** Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine should be considered if alcohol abuse is suspected. **Pyridoxine** (section 9.6.2) should be given if the status epilepticus is caused by pyridoxine deficiency.

Convulsive status epilepticus should be treated urgently with intravenous clonazepam, repeated once after 10 minutes if seizures recur or fail to respond. Intravenous diazepam is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Clonazepam can also be used as an alternative.

Where facilities for resuscitation are not immediately available, **diazepam** can be administered as a rectal solution or **midazolam** [unlicensed use] can be given into the buccal cavity.

**Important**

If, after initial treatment with benzodiazepines, seizures recur or fail to respond 20 minutes after onset, phenytoin sodium, fosphenytoin, or phenobarbital sodium should be used; contact intensive care unit if seizures continue at 30 minutes after onset. If these measures fail to control seizures 40 minutes after onset, anaesthesia with thiopental (section 15.1.1), midazolam (section 15.1.4), or in adults, a non-barbiturate anaesthetic such as propofol [unlicensed indication] (section 15.1.1), should be instituted with full intensive care support.

Phenytoin sodium may be given by slow intravenous injection, followed by the maintenance dosage if appropriate; monitor ECG and blood pressure and reduce rate of administration if bradycardia or hypotension occurs. Intramuscular use of phenytoin is not recommended (absorption is slow and erratic).

Alternatively, fosphenytoin, a pro-drug of phenytoin, can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin. Intravenous administration requires ECG monitoring. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin should be expressed in terms of phenytoin sodium.

**Paraldehyde** also remains a valuable drug. Given rectally it causes little respiratory depression and is therefore useful where facilities for resuscitation are poor.

For advice on the management of epileptic seizures in dental practice, see p. 27.

**Non-convulsive status epilepticus** The urgency to treat non-convulsive status epilepticus depends upon the severity of the patient’s condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

**CLONAZEPAM**

**Indications** status epilepticus; other forms of epilepsy, and myoclonus (section 4.8.1)

**Cautions** see Clonazepam, section 4.8.1; facilities for reversing respiratory depression with mechanical ventilation must be at hand (but see also notes above)

**Intravenous infusion** Intravenous infusion of clonazepam is potentially hazardous (especially if prolonged), calling for close and constant observation and best carried out in specialist centres with intensive care facilities. Prolonged infusion may lead to accumulation and delay recovery

**Contra-indications** see Clonazepam, section 4.8.1; avoid injections containing benzyl alcohol in neonates (see under preparations below)

**Hepatic impairment** see Benzodiazepines, section 4.1.2

**Renal impairment** see Benzodiazepines, section 4.1.2
4.8.2 Drugs used in status epilepticus

Pregnancy see Benzodiazepines, section 4.1.2, and Pregnancy, p. 280
Breast-feeding see Benzodiazepines, section 4.1.2
Side-effects see Clonazepam, section 4.8.1; hypotension and apnoea

Dose
- By intravenous injection into a large vein (over at least 2 minutes) or by intravenous infusion, 1 mg, repeated if necessary; CHILD all ages, 500 micrograms

Rivotril® (Roche) \( \text{Injection, clonazepam 1 mg/mL in solvent, for dilution with 1 mL water for injections immediately before injection or as described in Appendix 6. Net price 1-mL amp (with 1 mL water for injections) = 60p. Excipients include benzyl alcohol (avoid in neonates unless there is no safer alternative available; see Excipients, p. 2), ethanol, propylene glycol} \)

Oral preparations
Section 4.8.1

DIAZEPAM

Indications status epilepticus; febrile convulsions (section 4.8.3); convulsions due to poisoning (see p. 33); other indications (section 4.1.2, section 10.2.2, and section 15.1.4.1)

Cautions see Diazepam, section 4.1.2; when given intravenously facilities for reversing respiratory depression with mechanical ventilation must be at hand (but see also notes above)

Contra-indications see Diazepam, section 4.1.2

Hepatic impairment see Benzodiazepines, section 4.1.2

Renal impairment see Benzodiazepines, section 4.1.2, and Pregnancy, p. 280

Breast-feeding see Benzodiazepines, section 4.1.2

Side-effects see Diazepam, section 4.1.2; hypotension and apnoea

Dose
- Status epilepticus (but see notes above), febrile convulsions, status epilepticus; febrile convulsions (but see notes above), see Diazepam, section 4.1.2; hypotension and apnoea

Rivotril® (Roche) \( \text{Injection, clonazepam 1 mg/mL in solvent, for dilution with 1 mL water for injections immediately before injection or as described in Appendix 6. Net price 1-mL amp (with 1 mL water for injections) = 60p. Excipients include benzyl alcohol (avoid in neonates unless there is no safer alternative available; see Excipients, p. 2), ethanol, propylene glycol} \)

Oral preparations
Section 4.8.1

DIAZEPAM

Indications status epilepticus; febrile convulsions (section 4.8.3); convulsions due to poisoning (see p. 33); other indications (section 4.1.2, section 10.2.2, and section 15.1.4.1)

Cautions see Diazepam, section 4.1.2; when given intravenously facilities for reversing respiratory depression with mechanical ventilation must be at hand (but see also notes above)

Contra-indications see Diazepam, section 4.1.2

Hepatic impairment see Benzodiazepines, section 4.1.2

Renal impairment see Benzodiazepines, section 4.1.2, and Pregnancy, p. 280

Breast-feeding see Benzodiazepines, section 4.1.2

Side-effects see Diazepam, section 4.1.2; hypotension and apnoea

Dose
- Status epilepticus, febrile convulsions, status epilepticus; febrile convulsions (but see notes above), see Diazepam, section 4.1.2; hypotension and apnoea

Rivotril® (Roche) \( \text{Injection, clonazepam 1 mg/mL in solvent, for dilution with 1 mL water for injections immediately before injection or as described in Appendix 6. Net price 1-mL amp (with 1 mL water for injections) = 60p. Excipients include benzyl alcohol (avoid in neonates unless there is no safer alternative available; see Excipients, p. 2), ethanol, propylene glycol} \)

Oral preparations
Section 4.8.1

DIAZEPAM

Indications status epilepticus; febrile convulsions (section 4.8.3); convulsions due to poisoning (see p. 33); other indications (section 4.1.2, section 10.2.2, and section 15.1.4.1)

Cautions see Diazepam, section 4.1.2; when given intravenously facilities for reversing respiratory depression with mechanical ventilation must be at hand (but see also notes above)

Contra-indications see Diazepam, section 4.1.2

Hepatic impairment see Benzodiazepines, section 4.1.2

Renal impairment see Benzodiazepines, section 4.1.2, and Pregnancy, p. 280

Breast-feeding see Benzodiazepines, section 4.1.2

Side-effects see Diazepam, section 4.1.2; hypotension and apnoea

Dose
- Status epilepticus, febrile convulsions, status epilepticus; febrile convulsions (but see notes above), see Diazepam, section 4.1.2; hypotension and apnoea

Rivotril® (Roche) \( \text{Injection, clonazepam 1 mg/mL in solvent, for dilution with 1 mL water for injections immediately before injection or as described in Appendix 6. Net price 1-mL amp (with 1 mL water for injections) = 60p. Excipients include benzyl alcohol (avoid in neonates unless there is no safer alternative available; see Excipients, p. 2), ethanol, propylene glycol} \)
4.8.2 Drugs used in status epilepticus

Midazolam (Non-proprietary) (C)
Buccal liquid, midazolam 10 mg/mL.
Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

Injections
Section 15.1.4

Paraldehyde (Non-proprietary) (C)
Enema, 8–50%, available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

Phenobarbital Sodiu
m
(Phenobarbitalone sodiu
m)

Indications status epilepticus; other forms of epilepsy except absence seizures (section 4.8.1)

Cautions see Phenobarbital, section 4.8.1; interactions: see p. 279 and Appendix 1 (phenobarbital)

Hepatic impairment see Phenobarbital, section 4.8.1

Renal impairment see Phenobarbital, section 4.8.1

Pregnancy see Phenobarbital, section 4.8.1

Breast-feeding see Phenobarbital, section 4.8.1

Side-effects see Phenobarbital, section 4.8.1

Dose

● Status epilepticus, by intravenous injection (dilute injection 1 in 10 with water for injections), 10 mg/kg at a rate of not more than 100 mg/minute; max. 1 g

Note For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect

Phenobarbital (Non-proprietary) (C)
Injection, phenobarbital sodium 200 mg/mL, net price 1-mL amp = £2.00

Excipients include propylene glycol 90% (see Excipients, p. 2)

Note Must be diluted before intravenous administration (see under Dose)

Oral preparations
Section 4.8.1

Note

Pro-Epanutin

Fosphenytoin sodium doses in BNF may differ from those in product literature

Note

ELDERLY consider 10–25% reduction in dose or infusion rate

Note

Fosphenytoin sodium doses in BNF may differ from those in product literature

Note
4.8.3 Febrile convulsions

Brief febrile convulsions need no specific treatment; antipyretic medication, e.g. paracetamol (section 4.7.1) is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. Prolonged febrile convulsions (those lasting 5 minutes or longer), recurrent convulsions, or those occurring in a child at known risk must be treated more actively, as there is the possibility of resulting brain damage. Diazepam is the drug of choice given either by slow intravenous injection or preferably rectally in solution (section 4.8.2). The rectal route is preferred as satisfactory absorption is achieved within minutes and administration is much easier. Suppositories are not suitable because absorption is too slow. Intermittent prophylaxis (i.e. the anticonvulsant administered at the onset of fever) is possible in only a small proportion of children. Again, diazepam is the treatment of choice, orally or rectally.

Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated. Anticonvulsant treatment needs to be considered only for children at risk from prolonged or complex febrile convulsions, including those whose first seizure occurred at under 14 months or who have neurological abnormalities or who have had previous prolonged or focal convulsions.
Elderly Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

4.9.1 Dopaminergic drugs used in Parkinson’s disease

**Dopamine-receptor agonists**

The dopamine-receptor agonists, bromocriptine, cabergoline, pergolide, pramipexole, ropinirole, and rotigotine have a direct action on dopamine receptors. Initial treatment of Parkinson’s disease is often with dopamine-receptor agonists. They are also used with levodopa in more advanced disease. If a dopamine-receptor agonist is added to levodopa therapy, the dose of levodopa needs to be reduced (see individual monographs).

When used alone, dopamine-receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine-receptor agonists are associated with more psychiatric side-effects than levodopa. The ergot-derived dopamine-receptor agonists bromocriptine, cabergoline, and pergolide, are associated with fibrotic reactions (see notes below). Patients should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped recurring.

Apo morphine is a potent dopamine-receptor agonist that is sometimes helpful in advanced disease for patients experiencing unpredictable ‘off’ periods with levodopa treatment. Apomorphine should be initiated in a specialist clinic with at least two days pretreatment with domperidone (p. 253) for nausea and vomiting. After an overnight withdrawal of oral antiparkinsonian medication to induce an ‘off’ episode, the threshold dose of apomorphine is determined. Oral antiparkinsonian medication is then restarted. The patient must be taught to self-administer apomorphine by subcutaneous injection into the lower abdomen or outer thigh at the first sign of an ‘off’ episode. Once treatment has been established it may be possible to gradually reduce other antiparkinsonian medications and reduce or withdraw domperidone therapy. Treatment with apomorphine should remain under specialist supervision.

Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**Fibrotic reactions**

Ergot-derived dopamine-receptor agonists, bromocriptine, cabergoline, and pergolide, have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**Driving**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa, co-beneldopa, and dopamine-receptor agonists.

- Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped recurring.
- Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication that can disturb sleep. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**APOMORPHINE HYDROCHLORIDE**

**Indications** refractory motor fluctuations in Parkinson’s disease (‘off’ episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (for capable and motivated patients under specialist supervision)

**Cautions** see notes above; pulmonary disease, cardiovascular disease, history of postural hypotension (special care on initiation); susceptibility to QT-interval prolongation; neuropsychiatric conditions; monitor hepatic, haemopoietic, renal, and cardiovascular function; with concomitant levodopa test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation); **interactions:** Appendix 1 (apomorphine)

**Contra-indications** respiratory depression, dementia, hypersensitivity to opioids, psychosis; avoid if ‘on’
response to levodopa marred by severe dyskinesia or dystonia

**Hepatic impairment** avoid

**Renal impairment** use with caution

**Pregnancy** avoid unless clearly necessary

**Breast-feeding** no information available; may suppress lactation

**Side-effects** see notes above; also nausea, vomiting (see notes above); yawning; drowsiness (including sudden onset of sleep); confusion, hallucinations, less commonly postural hypotension, dyspnoea, dyskinesia during ‘off’ periods (may require discontinuation), haemolytic anaemia and thrombocytopenia with levodopa (see Cautions), and rash; rarely eosinophilia; peripheral oedema, compulsive behaviour, and dizziness also reported

**Dose**

- **By subcutaneous injection, ADULT** over 18 years, to determine threshold dose (see also notes above), initially 1 mg at the first sign of ‘off’ episode; if inadequate or no response after 30 minutes, then a further 2 mg should be given; thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained; usual range 3–30 mg daily in divided doses; subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses daily; max. single dose 10 mg

- **By continuous subcutaneous infusion, ADULT** over 18 years, (those requiring division into more than 10 injections daily) initially 1 mg/hour increased according to response (not more often than every 4 hours) in max. steps of 500 micrograms/hour, to usual rate of 1–4 mg/hour (15–60 micrograms/kg/hour); change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night-time symptoms); intermittent bolus boosts may be needed

  **Note** Total daily dose by either route (or combined routes) max. 100 mg

**Apomorphine (Non-proprietary)**

**Injection** apomorphine hydrochloride 10 mg/mL, net price 2-mL amp = £7.21, 5-mL amp = £13.89. Label: 10, counselling, driving, see notes above

**APO-go® (Genus)**

**Injection** apomorphine hydrochloride 10 mg/mL, net price 2-mL amp = £7.59, 5-mL amp = £14.62. Label: 10, counselling, driving, see notes above

**Excipients** include sulphites

**Injection (APO-go® Pen)**, apomorphine hydrochloride 10 mg/mL, net price 3-mL pen injector = £24.78. Label: 10, counselling, driving, see notes above

**Excipients** include sulphites

**Injection (APO-go® PFS)**, apomorphine hydrochloride 5 mg/mL, net price 10-mL prefilled syringe = £14.62. Label: 10, counselling, driving, see notes above

**Excipients** include sulphites

**BROMOCRIPTINE**

**Indications** Parkinson’s disease; endocrine disorders (Section 6.7.1)

**Cautions** see Bromocriptine in section 6.7.1 and notes above

**Contra-indications** see Bromocriptine, section 6.7.1

**Hepatic impairment** see Bromocriptine, section 6.7.1

**Pregnancy** see Bromocriptine, section 6.7.1

**Breast-feeding** see Bromocriptine, section 6.7.1

**Side-effects** see notes above and Bromocriptine, section 6.7.1

**Dose**

- First week 1–1.25 mg at night, second week 2–2.5 mg at night, third week 2.5 mg twice daily, fourth week 2.5 mg 3 times daily then increasing by 2.5 mg every 3–4 days according to response to a usual range of 10–30 mg daily; taken with food

**Preparations**

Section 6.7.1

**CABERGOLINE**

**Indications** alone or as adjunct to co-beneldopa or co-careldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate; endocrine disorders (section 6.7.1)

**Cautions** see Cabergoline in section 6.7.1 and notes above

**Contra-indications** see Cabergoline, section 6.7.1

**Hepatic impairment** see Cabergoline, section 6.7.1

**Pregnancy** see Cabergoline, section 6.7.1

**Breast-feeding** see Cabergoline, section 6.7.1

**Side-effects** see notes above and Cabergoline, section 6.7.1

**Dose**

- Initially 1 mg daily, increased by increments of 0.5–1 mg at 7 or 14 day intervals; max. 3 mg daily

**Note** Concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased

**Cabergoline (Non-proprietary)**

**Tablets** scored, cabergoline 1 mg, net price 20-tab pack = £59.08; 2 mg, 20-tab pack = £71.13. Label: 10, 21, counselling, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**Cabaser® (Pharmacia)**

**Tablets** scored, cabergoline 1 mg, net price 20-tab pack = £83.00; 2 mg, 20-tab pack = £83.00. Label: 10, 21, counselling, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**PERGOLIDE**

**Indications** alone or as adjunct to co-beneldopa or co-careldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate

**Cautions** see notes above; arrhythmias or underlying cardiac disease; history of confusion, psychosis, or hallucinations, dyskinesia (may exacerbate); acute porphyria (section 9.8.2); interactions: Appendix 1 (pergolide)

**Contra-indications** history of fibrotic disorders; cardiac valvulopathy (exclude before treatment, see Fibrotic Reactions, p. 298)

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** may suppress lactation

**Side-effects** see notes above; also nausea, vomiting, dyspepsia, abdominal pain; dyspnoea, rhinitis; hallucinations, dyskinesia, drowsiness (including sudden onset of sleep); diplopia, also reported constipation,
diarrhoea, hiccupps, tachycardia, atrial premature contractions, palpitation, hypotension, syncope, Raynaud’s phenomenon, compulsive behaviour, insomnia, confusion, dizziness, fever, erythromelalgia, and rash

**Dose**

- **Monotherapy**, 50 micrograms at night on day 1, then 50 micrograms twice daily on days 2–4, then increased by 100–250 micrograms daily every 3–4 days to 1.5 mg daily in 3 divided doses at day 28; after day 30, further increases every 3–4 days of up to 250 micrograms daily; usual maintenance dose 2.1–2.5 mg daily; max. 3 mg daily

- **Adjunctive therapy with levodopa**, 50 micrograms daily for 2 days, increased gradually by 100–150 micrograms every 3 days over next 12 days, usually given in 3 divided doses; further increases of 250 micrograms every 3 days; max. 3 mg daily; during pergolide titration levodopa dose may be reduced cautiously

**Pergolide (Non-proprietary) (p)

**Tablets**, pergolide (as mesilate) 50 micrograms, net price 100-tab pack = £17.42; 250 micrograms, 100-tab pack = £14.68; 1 mg, 100-tab pack = £41.95. Label: 10, counselling, driving, see notes above

**Celance® (Lilly) (p)

**Tablets**, scored, pergolide (as mesilate) 50 micrograms (ivory), net price 100-tab pack = £20.70; 250 micrograms (green), 100-tab pack = £21.12; 1 mg (pink), 100-tab pack = £43.44. Label: 10, counselling, driving, see notes above

**Note** Caution if splitting tablets—may cause eye irritation, nasal irritation, and headache

**Pramipexole**

**Indications** Parkinson’s disease, used alone or as an adjunct to co-beneldopa or co-careldopa; moderate to severe restless legs syndrome

**Cautions** see notes above; psychotic disorders; ophthalmological testing recommended (risk of visual disturbance); severe cardiovascular disease; risk of postural hypotension (especially on initiation)—monitor blood pressure; **interactions**: Appendix 1 (pramipexole)

**Renal impairment**

- for **immediate-release** in Parkinson’s disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m²; if renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR

- for **immediate-release** in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m²

- for **modified-release** tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/minute/1.73m², increased to 260 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** use only if potential benefit outweighs risk—no information available

**Breast-feeding** may suppress lactation; avoid—present in milk in animal studies

**Side-effects** see notes above; also nausea, constipation, vomiting, weight changes, hypotension (including postural hypotension), peripheral oedema, dizziness, dyskinesia, drowsiness (including sudden onset of sleep), amnesia, headache, sleep disturbances, confusion, hallucinations, restlessness, visual disturbances; less commonly syncope, pneumonia, dysphoria, compulsive behaviour, delusion, paranoia, pruritus, rash; also reported paradoxical worsening of restless legs syndrome

**Dose**

**Important** Doses and strengths are stated in terms of pramipexole (base); equivalent strengths in terms of pramipexole dihydrochloride monohydrate (salt) are as follows:

- 88 micrograms base = 125 micrograms salt
- 180 micrograms base = 250 micrograms salt
- 350 micrograms base = 500 micrograms salt
- 700 micrograms base = 1 mg salt

- Parkinson’s disease, ADULT over 18 years, initially 88 micrograms 3 times daily, dose doubled every 5–7 days if tolerated to 350 micrograms 3 times daily; further increased if necessary by 180 micrograms 3 times daily at weekly intervals; max. 3.3 mg daily in 3 divided doses

**Note** During dose titration and maintenance, levodopa dose may be reduced

- Restless legs syndrome, ADULT over 18 years, initially 88 micrograms once daily 2–3 hours before bedtime, dose doubled every 4–7 days if necessary; max. 540 micrograms daily

**Note** Repeat dose titration if restarting treatment after an interval of more than a few days

**Mirapexin® (Boehringer Ingelheim) (p)

**Tablets**, pramipexole 88 micrograms, net price 30-tab pack = £9.55; 180 micrograms (scored), 30-tab pack = £19.10; 100-tab pack = £63.67; 350 micrograms (scored), 30-tab pack = £38.20; 100-tab pack = £127.34; 700 micrograms (scored), 30-tab pack = £76.40; 100-tab pack = £254.69. Label: 10, counselling, driving, see notes above

**Modified release**

**Mirapexin® Prolonged Release** (Boehringer Ingelheim) (p)

**Tablets**, m/r, pramipexole 260 micrograms, net price 30-tab pack = £28.65; 520 micrograms, 30-tab pack = £57.30; 1.05 mg, 30-tab pack = £114.60; 1.57 mg, 30-tab pack = £171.90; 2.1 mg, 30-tab pack = £229.20; 2.62 mg, 30-tab pack = £286.50; 3.15 mg, 30-tab pack = £343.80. Label: 10, 25, counselling, driving, see notes above

**Important** Doses and strengths are stated in terms of pramipexole (base); equivalent strengths in terms of pramipexole dihydrochloride monohydrate (salt) are as follows:

- 260 micrograms base = 375 micrograms salt
- 520 micrograms base = 750 micrograms salt
- 1.05 mg base = 1.5 mg salt
- 1.57 mg base = 2.25 mg salt
- 2.1 mg base = 3 mg salt
- 2.62 mg base = 3.75 mg salt
- 3.15 mg base = 4.5 mg salt

**Dose** Parkinson’s disease (with or without co-beneldopa or co-careldopa), ADULT over 18 years, initially 260 micrograms once daily, dose doubled every 5–7 days to 1.05 mg once daily; further increased if necessary by 520 micrograms daily at weekly intervals; max. 3.15 mg once daily

**Note** During dose titration and maintenance, levodopa dose may be reduced
ROPINROLE

**Indications** Parkinson’s disease, either used alone or as adjunct to co-beneldopa or co-careldopa; moderate to severe restless legs syndrome

**Cautions** see notes above; severe cardiovascular disease, major psychiatric disorders; dose adjustment may be necessary if smoking started or stopped during treatment; interactions: Appendix 1 (ropinirole)

**Hepatic impairment** caution in moderate impairment; avoid in severe impairment

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** avoid unless potential benefit outweighs risk—tOXICITY in animal studies

**Breast-feeding** may suppress lactation—avoid

**Side-effects** see notes above; also nausea, vomiting, abdominal pain, dyspepsia, constipation; hypotension; syncope, peripheral oedema; drowsiness (including sudden onset of sleep, see p. 298); dizziness, nervousness, fatigue, dyskinesia, hallucinations, confusion; less commonly psychosis, compulsive behaviour; very rarely hepatic disorders; also reported paradoxical worsening of restless legs syndrome

**Dose**
- Parkinson’s disease, initially 750 micrograms daily in 3 divided doses, increased by increments of 750 micrograms at weekly intervals to 3 mg daily; further increased by increments of up to 3 mg at weekly intervals according to response; usual range 9–16 mg daily (but higher doses may be required if used with levodopa); max. 24 mg daily
- Restless legs syndrome, **ADULT** over 18 years initially 250 micrograms at night for 2 days, increased if tolerated to 500 micrograms at night for 5 days and then to 1 mg at night for 7 days; further increased at weekly intervals in steps of 500 micrograms daily according to response; usual dose 2 mg at night; max. 4 mg daily

**Note** Repeat dose titration if restarting after interval of more than a few days

**Ropinirole (Non-proprietary)**

Tablets, ropinirole (as hydrochloride) 250 micrograms, net price 12-tab pack = £2.79; 500 micrograms, 28-tab pack = £7.72; 1 mg, 84-tab pack = £27.65; 2 mg, 84-tab pack = £54.43; 5 mg, 84-tab pack = £107.55. Label: 10, 21, counselling, driving, see notes above

**Adartrel®** (GSK)

Tablets, f/c, ropinirole (as hydrochloride) 250 micrograms (white), net price 12-tab pack = £3.94; 500 micrograms (yellow), 28-tab pack = £15.75, 84-tab pack = £47.26; 2 mg (pink), 28-tab pack = £31.51, 84-tab pack = £94.53. Label: 10, 21, counselling, driving, see notes above

**Requip®** (GSK)

Tablets, f/c, ropinirole (as hydrochloride) 1 mg (green), net price 84-tab pack = £47.26; 2 mg (pink), 84-tab pack = £94.53; 5 mg (blue), 84-tab pack = £163.27; 28-day starter pack of 42 × 500-microgram (white) tablets, 42 × 500-microgram (yellow) tablets, and 21 × 1-mg (green) tablets = £40.10; 28-day follow-on pack of 42 × 500-microgram (yellow) tablets, 42 × 1-mg (green) tablets, and 63 × 2-mg (pink) tablets = £74.40. Label: 10, 21, counselling, driving, see notes above

**Modified release**

Requip® XL (GSK)

Tablets, m/r, f/c, ropinirole (as hydrochloride) 2 mg (pink), net price 28-tab pack = £31.36; 4 mg (brown), 28-tab pack = £62.72; 8 mg (red), 28-tab pack = £105.28. Label: 10, 25, counselling, driving, see notes above

Dose stable Parkinson’s disease in patients transferring from ropinirole immediate-release tablets, initially Requip® XL once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, in patients receiving less than 8 mg once daily, increase in steps of 2 mg at intervals of at least 1 week to 8 mg once daily according to response; in patients receiving 8 mg once daily or more, increase in steps of 2 mg at intervals of at least 2 weeks according to response: max. 24 mg once daily

**Note** When administered as adjunct to levodopa, concurrent dose of levodopa may be reduced

ROTIGOTINE

**Indications** Parkinson’s disease, either used alone or as adjunct to co-beneldopa or co-careldopa; moderate to severe restless legs syndrome

**Cautions** see notes above; ophthalmic testing recommended; avoid exposure of patch to heat; withdraw gradually; interactions: Appendix 1 (rotigotine)

**Hepatic impairment** caution in severe impairment—no information available

**Pregnancy** avoid—no information available

**Breast-feeding** may suppress lactation; avoid—present in milk in animal studies

**Side-effects** see notes above; also constipation, dry mouth, dyspepsia, nausea, vomiting, weight changes; hypertension, postural hypotension, palpitation, peripheral oedema; hiccup; asthma, dizziness, drowsiness (including sudden onset of sleep), sleep disturbances, dyskinesia, hallucinations, headache, syncope, sweating, rash, pruritus; less commonly abdominal pain, atrial fibrillation, hypotension, confusion, paranoia, compulsive behaviour, erectile dysfunction, and visual disturbances; rarely tachycardia, seizures, irritability, obsessive compulsive disorder, and psychotic disorder

**Dose**
- Monotherapy in Parkinson’s disease, initially apply ‘2 mg/24 hours’ patch, increased in steps of 2 mg/24 hours at weekly intervals if required; max. 8 mg/24 hours
- Adjunctive therapy with levodopa in Parkinson’s disease, initially apply ‘4 mg/24 hours’ patch, increased in steps of 2 mg/24 hours at weekly intervals if required; max. 16 mg/24 hours
- Restless legs syndrome, initially apply ‘1 mg/24 hours’ patch, increased in steps of 1 mg/24 hours at weekly intervals if required: max. 3 mg/24 hours

**Note** Apply patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for 14 days)

**Neuproc®** (UCB Pharma)

Patches, self-adhesive, beige, rotigotine 1 mg/24 hours, net price 28 = £77.24; 2 mg/24 hours, 28 = £97.48; 4 mg/24 hours,
Levodopa

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor that reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting and cardiovascular effects. Additionally, effective brain-dopamine concentrations can be achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benserazide (in co-beneldopa) and carbidopa (in co-careldopa).

Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients.

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient.

Note When co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting but domperidone (section 4.6) may be useful in controlling these effects. Levodopa treatment is associated with potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the ‘on’ period, and weakness and restricted mobility during the ‘off’ period. ‘End-of-dose’ deterioration with progressively shorter duration of benefit also occurs. Modified-release preparations may help with ‘end-of-dose’ deterioration or nocturnal immobility and rigidity. Motor complications are particularly problematic in young patients treated with levodopa.

Cautions Levodopa should be used with caution in severe pulmonary or cardiovascular disease (including history of myocardial infarction with residual arrhythmia), psychiatric illness (avoid if severe and discontinue if deterioration), endocrine disorders (including hyperthyroidism, Cushing’s syndrome, diabetes mellitus, osteomalacia, and phaeochromocytoma), and in those with a history of convulsions or peptic ulcer. Levodopa should be used with caution in patients susceptible to angle-closure glaucoma, and in hepatic or renal impairment. Patients should be advised to avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis), and to be aware of the potential for excessive drowsiness and sudden onset of sleep (see Driving, p. 298).

Interactions

Pregnancy Levodopa should be used with caution in pregnancy—toxicity has occurred in animal studies.

Breast-feeding Levodopa may suppress lactation. It is present in milk—avoid.

Side-effects Side-effects of levodopa include nausea, vomiting, taste disturbances, dry mouth, anorexia, arhythmias, palpitations, postural hypotension, syncope, drowsiness (see Driving, p. 298), fatigue, dementia, psychosis, confusion, euphoria, abnormal dreams, insomnia, depression (very rarely with suicidal ideas), anxiety, dizziness, dystonia, dyskinesia, and chorea.

Less commonly weight changes, constipation, diarrhoea, hypersalivation, dysphagia, flatulence, hypertension, chest pain, oedema, hoarseness, ataxia, hand tremor, malaise, weakness, muscle cramps, and reddish discoloration of the urine and other body fluids may occur. Rare side-effects include abdominal pain, gastrointestinal bleeding, duodenal ulcer, dyspepsia, phlebitis, dysphoria, agitation, parasthesia, bruxism, trismus, hiccup, neuroleptic malignant syndrome (associated with abrupt withdrawal), convulsions, reduced mental acuity, disorientation, headache, urinary retention, urinary incontinence, priapism, activation of malignant melanoma, leucopenia, haemolytic and non-haemolytic anaemia, thrombocytopenia, agranulocytosis, blurred vision, blepharospasm, diplopia, activation of Homer’s syndrome, pupil dilatation, oculogyric crisis, flushing, alopecia, exanthema, Henoch-Schönlein purpura, and sweating; very rarely angle-closure glaucoma may occur; compulsive behaviour and false positive tests for urinary ketones have also been reported.

A mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa

Indications Parkinson’s disease, see notes above

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

● See preparations

Madopar® (Roche) (Table 4.9.1.4.2.1 Dopaminergic drugs used in Parkinson’s disease)

Capsules (Madopar®-62.5 mg), blue/grey, co-beneldopa 12.5/50 (benserazide 12.5 mg (as hydrochloride), levodopa 50 mg), net price 100-cap pack = £4.96. Label: 10, 14, counselling, driving, see notes above

Capsules (Madopar®-125 mg), blue/pink, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride), levodopa 100 mg), net price 100-cap pack = £8.91. Label: 10, 14, counselling, driving, see notes above

CO-BENELDOPA

A mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa

Indications Parkinson’s disease, see notes above

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

● See preparations

Madopar® (Roche) (Table 4.9.1.4.2.1 Dopaminergic drugs used in Parkinson’s disease)

Capsules (Madopar®-62.5 mg), blue/grey, co-beneldopa 12.5/50 (benserazide 12.5 mg (as hydrochloride), levodopa 50 mg), net price 100-cap pack = £4.96. Label: 10, 14, counselling, driving, see notes above

Capsules (Madopar®-125 mg), blue/pink, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride), levodopa 100 mg), net price 100-cap pack = £8.91. Label: 10, 14, counselling, driving, see notes above

Note Remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion.

The Scottish Medicines Consortium (p. 4) has advised that Neupro® is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson’s disease (June 2007) and for restricted use for the treatment of advanced Parkinson’s disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007).

Note The Scottish Medicines Consortium (p. 4) has advised (April 2009) that rotigotine (Neupro®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.
Capsules (Madopar® 250 mg, blue/caramel, co-beneldopa 50/200 (benzerazide 50 mg (as hydrochloride), levodopa 200 mg), net price 100-cap pack = £11.78. Label: 10, 14, counselling, driving, see notes above

Dispersible tablets, scored, co-beneldopa 12.5/50 (benzerazide 12.5 mg (as hydrochloride), levodopa 50 mg), net price 100-tab pack = £5.90. Label: 10, 14, counselling, administration, see below, driving, see notes above

Dispersible tablets, scored, co-beneldopa 25/100 (benzerazide 25 mg (as hydrochloride), levodopa 100 mg), net price 100-tab pack = £10.45. Label: 10, 14, counselling, administration, see below, driving, see notes above

Counselling: The dispensible tablets can be dispersed in water or orange squash (not orange juice) or swallored whole

Dose: expressed as levodopa, initially 50 mg 3–4 times daily (100 mg 3 times daily in advanced disease), increased by 100 mg daily once or twice weekly according to response; usual maintenance dose 400–600 mg daily in divided doses. ELDERLY initially 50 mg once or twice daily, increased by 50 mg daily every 3–4 days according to response.

Note: When transferring patients from another levodopa/dopamine-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before (although interval can be shorter).

Modified release

Madopar® CR (Roche) 5M
Capsules, m/r, dark green/light blue, co-beneldopa 25/100 (benzerazide 25 mg (as hydrochloride), levodopa 100 mg), net price 100-cap pack = £12.77. Label: 5, 10, 14, 25, counselling, driving, see notes above

Dose: patients not taking levodopa/dopa-decarboxylase inhibitor therapy, initially 1 capsule 3 times daily (max. initial dose 6 capsules daily).

Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks

Supplementary dose of immediate-release Madopar® may be needed with first morning dose; if response still poor to total daily dose of Madopar® CR plus Madopar® corresponding to 1 g levodopa, consider alternative therapy

CO-CARELDOPA

A mixture of carbidopa and levodopa, the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively

Indications: Parkinson’s disease, see notes above

Cautions: see notes above

Pregnancy: see notes above

Breast-feeding: see notes above

Side-effects: see notes above

Dose:

- Expressed as levodopa, initially 100 mg (with carbidopa 25 mg) 3 times daily, increased by 50–100 mg (with carbidopa 12.5–25 mg) daily or on alternate days according to response, up to 800 mg (with carbidopa 200 mg) daily in divided doses.

- Alternatively, initially 50–100 mg (with carbidopa 10–12.5 mg) 3–4 times daily, increased by 50–100 mg daily or on alternate days according to response, up to 800 mg (with carbidopa 80–100 mg) daily in divided doses.

- Alternatively, initially 125 mg (with carbidopa 12.5 mg, as ½ tablet of co-careldopa 25/250) 1–2 times daily, increased by 125 mg (with carbidopa 12.5 mg) daily or on alternate days according to response.

Note: At least 70 mg carbidopa daily is necessary to achieve full inhibition of peripheral dopa-decarboxylase. When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.

Co-careldopa (Non-proprietary) 5M

Tablets, co-careldopa 10/100 (carbidopa 10 mg (anhydrous), levodopa 100 mg), net price 100-tab pack = £7.30. Label: 10, 14, counselling, driving, see notes above.

Tablets, co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 100-tab pack = £24.45. Label: 10, 14, counselling, driving, see notes above.

Tablets, co-careldopa 25/250 (carbidopa 25 mg (anhydrous), levodopa 250 mg), net price 100-tab pack = £34.58. Label: 10, 14, counselling, driving, see notes above.

Sinemet® (MSD) 5M

Tablets (Sinemet®-62.5), yellow, scored, co-careldopa 12.5/50 (carbidopa 12.5 mg (anhydrous), levodopa 50 mg), net price 90-tab pack = £6.28. Label: 10, 14, counselling, driving, see notes above.

Note: 2 tablets Sinemet®-62.5 = 1 tablet Sinemet Plus®.

Tablets (Sinemet®-110), blue, scored, co-careldopa 10/100 (carbidopa 10 mg (anhydrous), levodopa 100 mg), net price 90-tab pack = £6.57. Label: 10, 14, counselling, driving, see notes above.

Tablets (Sinemet®-Plus), yellow, scored, co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 90-tab pack = £9.66. Label: 10, 14, counselling, driving, see notes above.

Note: Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed.

Tablets (Sinemet®-275), blue, scored, co-careldopa 25/250 (carbidopa 25 mg (anhydrous), levodopa 250 mg), net price 90-tab pack = £13.72. Label: 10, 14, counselling, driving, see notes above.

For use with enteral tube

Duodopa® (Abbott Healthcare) 5M

Intestinal gel, co-careldopa 5/20 (carbidopa 5 mg as monohydrate, levodopa 20 mg)/mL, net price 100 mL cassette (for use with Duodopa® portable pump) = £77.00. Label: 10, 14, counselling, driving, see notes above.

Dose: severe Parkinson’s disease inadequately controlled by other preparations, consult product literature.

Modified release

Caramet® CR (TEVA UK) 5M

Tablets, m/r, orange-brown, co-careldopa 25/100 (carbidopa 25 mg (as monohydrate), levodopa 100 mg), net price 60-tab pack = £11.47; co-careldopa 50/200 (carbidopa 50 mg (as monohydrate), levodopa 200 mg), 60-tab pack = £11.47. Label: 10, 14, 25, counselling, driving, see notes above.

Dose: patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa, initially 100–200 mg twice daily (at least 6 hours between doses); dose adjusted according to response at intervals of at least 2 days.

Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, discontinue previous preparation at least 12 hours before first dose of Caramet® CR; substitute Caramet® CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%, dose then adjusted according to response at intervals of at least 2 days.

Central nervous system

BNF 61

4.9.1 Dopaminergic drugs used in Parkinson’s disease

303
Central nervous system

4.9.1 Dopaminergic drugs used in Parkinson’s disease

**Half Sinemet® CR (MSD)**

- **Tablets**, m/r, pink, co-careldopa 25/100 (carbidopa 25 mg, levodopa 100 mg), net price 60-tab pack = £11.60. Label: 10, 14, 25, counselling, driving, see notes above
- **Dose** for fine adjustment of Sinemet® CR dose (see below)

**Sinemet® CR (MSD)**

- **Tablets**, m/r, peach, scored, co-careldopa 50/200 (carbidopa 50 mg, levodopa 200 mg), net price 60-tab pack = £11.60. Label: 10, 14, 25, counselling, driving, see notes above
- **Dose** patients not receiving levodopa/dopa-decarboxylase inhibitor therapy, initially, 1 Sinemet® CR tablet twice daily; both dose and interval then adjusted according to response at intervals of not less than 3 days
- Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, 1 Sinemet® CR tablet twice daily can be substituted for a daily dose of levodopa 300–400 mg in immediate-release Sinemet® tablets (substitute Sinemet® CR to provide approx. 10% more levodopa per day and extend dosing interval by 30–50%); dose and interval then adjusted according to response at intervals of not less than 3 days

### With entacapone

For Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**Stalevo**® (Orion)

- **Tablets**, f/c, brown, levodopa 50 mg, carbidopa 12.5 mg, entacapone 200 mg, net price 30-tab pack = £20.79, 100-tab pack = £69.31. Label: 10, 14 (urine reddish-brown), 25, counselling, driving, see notes above
- **Dose** only 1 tablet to be taken for each dose; max. 7 tablets daily

- **Tablets**, f/c, brown, levodopa 75 mg, carbidopa 18.75 mg, entacapone 200 mg, net price 30-tab pack = £20.79, 100-tab pack = £69.31. Label: 10, 14 (urine reddish-brown), 25, counselling, driving, see notes above
- **Dose** only 1 tablet to be taken for each dose; max. 10 tablets daily

- **Tablets**, f/c, brown, levodopa 100 mg, carbidopa 25 mg, entacapone 200 mg, net price 30-tab pack = £20.79, 100-tab pack = £69.31. Label: 10, 14 (urine reddish-brown), 25, counselling, driving, see notes above
- **Dose** only 1 tablet to be taken for each dose; max. 10 tablets daily

- **Tablets**, f/c, brown, levodopa 125 mg, carbidopa 31.25 mg, entacapone 200 mg, net price 30-tab pack = £20.79, 100-tab pack = £69.31. Label: 10, 14 (urine reddish-brown), 25, counselling, driving, see notes above
- **Dose** only 1 tablet to be taken for each dose; max. 10 tablets daily

**RASAGILINE**

**Indications** Parkinson’s disease, used alone or as adjunct to co-beneldopa or co-careldopa

**Cautions** avoid abrupt withdrawal; **interactions:** Appendix 1 (rasagiline)

**Hepatic impairment** use with caution in mild impairment; avoid in moderate to severe impairment

**Pregnancy** use with caution

**Breast-feeding** use with caution—may suppress lactation

**Side-effects** dry mouth, dyspepsia, constipation, flatulence; angina; headache, depression, anorexia, weight loss, abnormal dreams, vertigo, hallucinations; influenza-like symptoms; urinary urgency; leukopenia; arthralgia; conjunctivitis; rhinitis; rash, skin carcinoma; less commonly myocardial infarction, and cerebrovascular accident

**Dose**

- 1 mg daily

**Azilect®** (Teva)

- **Tablets**, rasagiline (as mesilate) 1 mg, net price 28-tab pack = £70.72

**SELEGILINE HYDROCHLORIDE**

**Indications** Parkinson’s disease, used alone or as adjunct to co-beneldopa or co-careldopa

**Cautions** avoid abrupt withdrawal; gastric and duodenal ulceration (avoid in active ulceration), uncontrolled hypertension, arrhythmias, angina, psychosis, side-effects of levodopa may be increased, concurrent levodopa dosage can be reduced by 10–30%; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (selegiline)

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** use with caution in severe impairment
Pregnancy avoid—no information available
Breast-feeding avoid—no information available

**Side-effects**
- Nausea, constipation, diarrhoea, dry mouth; postural hypotension; dyskinesia, vertigo, sleeping disorders, confusion, hallucinations; arthralgia, myalgia; mouth ulcers with oral lypophilisate; rarely arrhythmias, agitation, headache, micturition difficulties, skin reactions; very rarely hypersexuality; also reported chest pain

**Dose**
- *Eldepryl*® (Orion)® Tablets, scored, selegiline hydrochloride 5 mg, net price 60-tab pack = £9.91; 10 mg, 30-tab pack = £6.67

**Selegiline Hydrochloride** (Non-proprietary)

Tablets, selegiline hydrochloride 5 mg, net price 60-tab pack = £5.59; 10 mg, 30-tab pack = £6.87

**Eldepryl® (Orion)® Tablets**, scored, selegiline hydrochloride 5 mg, net price 60-tab pack = £9.91; 10 mg, 30-tab pack = £6.67

**Selegiline Hydrochloride** (Non-proprietary)

Oral liquid, selegiline hydrochloride 10 mg/5 mL, net price 200 mL = £17.93

**Oral lypophilisate**

**Zelapar**® (Cephalon)®

Oral lypophilisates (freeze-dried tablets), yellow, selegiline hydrochloride 1.25 mg, net price 30-tab pack = £43.16. Counselling, administration: Excipients include aspartame (section 9.4.1)

**Dose** 1.25 mg daily before breakfast

**Counselling** Tablets should be placed on the tongue and allowed to dissolve. Advise patient not to drink, rinse, or wash mouth out for 5 minutes after taking the tablet

**Note** Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to Zelapar® 1.25 mg

**Catechol-O-methyltransferase inhibitors**

Entacapone and tolcapone prevent the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain. They are licensed for use as an adjunct to co-beneldopa or co-careldopa for patients with Parkinson’s disease who experience ‘end-of-dose’ deterioration and cannot be stabilised on these combinations. Due to the risk of hepatotoxicity, tolcapone should be prescribed under specialist supervision only, when other catechol-O-methyltransferase inhibitors combined with co-beneldopa or co-careldopa are ineffective.

**ENTACAPONE**

**Indications**
- Adjunct to co-beneldopa or co-careldopa in Parkinson’s disease and ‘end-of-dose’ motor fluctuations

**Cautions**
- Ischaemic heart disease; avoid abrupt withdrawal; concurrent levodopa dose may need to be reduced by about 10–30%; interactions: Appendix 1 (entacapone)

**Contra-indications**
- Phaeochromocytoma; history of neuroleptic malignant syndrome or non-traumatic rhabdomyolysis

**BNF 61 4.9.1 Dopaminergic drugs used in Parkinson’s disease 305**

**Hepatic impairment**

**Pregnancy** avoid—no information available

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects**
- Nausea, vomiting, abdominal pain, constipation, diarrhoea, urine may be coloured reddish-brown, dry mouth; ischaemic heart disease; confusion, dizziness, abnormal dreams, fatigue, insomnia, dystonia, dyskinesia, hallucinations; sweating, less commonly myocardial infarction; rarely rash; very rarely anorexia, weight loss, agitation, and urticaria; also reported hepatitis, colitis, neuroleptic malignant syndrome, rhabdomyolysis, and skin, hair, and nail discoloration

**Dose**
- 200 mg with each dose of levodopa with decarboxylase inhibitor; max. 2 g daily

**Comtess® (Orion)® Tablets**, f/c, brown/orange, entacapone 200 mg, net price 30-tab pack = £17.24, 100-tab pack = £57.45. Label: 14, (urine reddish-brown), counselling, driving, see notes above, avoid iron-containing products at the same time of day

**TOLCAPONE**

**Indications**
- Adjunct to co-beneldopa or co-careldopa in Parkinson’s disease and ‘end-of-dose’ motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under specialist supervision)

**Cautions**
- Avoid abrupt withdrawal; most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%; interactions: Appendix 1 (tolcapone)

**Hepatotoxicity**

**Potentially life-threatening hepatotoxicity** including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased); discontinue if abnormal liver function tests or symptoms of liver disorder (counselling, see below); do not re-introduce tolcapone once discontinued

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

**Contra-indications**
- Severe dyskinesia, phaeochromocytoma, previous history of neuroleptic malignant syndrome, rhabdomyolysis, or hyperthermia

**Hepatic impairment** avoid; see also under Cautions

**Renal impairment**
- Caution if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**
- Toxicity in animal studies—use only if potential benefit outweighs risk

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects**
- Diarrhoea, constipation, dyspepsia, abdominal pain, nausea, vomiting, anorexia, xerostomia, hepatotoxicity (see above); chest pain; confusion, dystonia, dyskinesia, drowsiness, headache, dizziness, sleep disturbances, excessive dreaming, hallucinations; syncope; urinary discoloration; sweating; neuroleptic malignant syndrome and rhabdomyolysis reported on dose reduction or withdrawal
4.9.2 Antimuscarinic drugs used in parkinsonism

Antimuscarinic drugs exert their antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency. Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson’s disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine, procyclidine, and trihexyphenidyl reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson’s disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing salivation.

No important differences exist between the antimuscarinic drugs, but some patients tolerate one better than another. Procyclidine can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

Cautions Antimuscarinics should be used with caution in cardiovascular disease, hypertension, psychotic disorders, prostatic hypertrophy, pyrexia, in those susceptible to angle-closure glaucoma, and in the elderly. Antimuscarinics should not be withdrawn abruptly in patients receiving long-term treatment. Antimuscarinics are liable to abuse. Interactions: Appendix 1 (Antimuscarinics)

Driving May affect performance of skilled tasks (e.g. driving)

Contra-indications Antimuscarinics should be avoided in gastro-intestinal obstruction and myasthenia gravis.

Hepatic and renal impairment Orphenadrine, procyclidine, and trihexyphenidyl should be used with caution in patients with hepatic or renal impairment.

Side-effects Side-effects of antimuscarinics include constipation, dry mouth, nausea, vomiting, tachycardia, dizziness, confusion, euphoria, hallucinations, impaired memory, anxiety, restlessness, urinary retention, blurred vision, and rash. Angle-closure glaucoma may occur very rarely.

4.9.2 Antimuscarinic drugs used in parkinsonism

Antimuscarinic drugs exert their antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency. Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson’s disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine, procyclidine, and trihexyphenidyl reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson’s disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing salivation.

No important differences exist between the antimuscarinic drugs, but some patients tolerate one better than another. Procyclidine can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

Cautions Antimuscarinics should be used with caution in cardiovascular disease, hypertension, psychotic disorders, prostatic hypertrophy, pyrexia, in those susceptible to angle-closure glaucoma, and in the elderly. Antimuscarinics should not be withdrawn abruptly in patients receiving long-term treatment. Antimuscarinics are liable to abuse. Interactions: Appendix 1 (Antimuscarinics)

Driving May affect performance of skilled tasks (e.g. driving)

Contra-indications Antimuscarinics should be avoided in gastro-intestinal obstruction and myasthenia gravis.

Hepatic and renal impairment Orphenadrine, procyclidine, and trihexyphenidyl should be used with caution in patients with hepatic or renal impairment.

Side-effects Side-effects of antimuscarinics include constipation, dry mouth, nausea, vomiting, tachycardia, dizziness, confusion, euphoria, hallucinations, impaired memory, anxiety, restlessness, urinary retention, blurred vision, and rash. Angle-closure glaucoma may occur very rarely.

4.9.2 Antimuscarinic drugs used in parkinsonism

Antimuscarinic drugs exert their antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency. Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson’s disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine, procyclidine, and trihexyphenidyl reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson’s disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing salivation.

No important differences exist between the antimuscarinic drugs, but some patients tolerate one better than another. Procyclidine can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

Cautions Antimuscarinics should be used with caution in cardiovascular disease, hypertension, psychotic disorders, prostatic hypertrophy, pyrexia, in those susceptible to angle-closure glaucoma, and in the elderly. Antimuscarinics should not be withdrawn abruptly in patients receiving long-term treatment. Antimuscarinics are liable to abuse. Interactions: Appendix 1 (Antimuscarinics)

Driving May affect performance of skilled tasks (e.g. driving)

Contra-indications Antimuscarinics should be avoided in gastro-intestinal obstruction and myasthenia gravis.

Hepatic and renal impairment Orphenadrine, procyclidine, and trihexyphenidyl should be used with caution in patients with hepatic or renal impairment.

Side-effects Side-effects of antimuscarinics include constipation, dry mouth, nausea, vomiting, tachycardia, dizziness, confusion, euphoria, hallucinations, impaired memory, anxiety, restlessness, urinary retention, blurred vision, and rash. Angle-closure glaucoma may occur very rarely.
Kemadrin® (Auden Mckenzie) (Non-proprietary)
Injection, procyclidine hydrochloride 5 mg/mL, net price 2-mL amp = £1.49

TRIHEXYPHENIDYL HYDROCHLORIDE
(Benzhexol hydrochloride)

Indications parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Pregnancy use only if potential benefit outweighs risk

Breast-feeding avoid

Side-effects see notes above

Dose

- 1 mg daily, increased gradually; usual maintenance dose 5–15 mg daily in 3–4 divided doses (max. 20 mg daily); ELDERLY preferably lower end of range; CHILD under 18 years see BNF for Children

Trihexyphenidyl (Non-proprietary)
Tablets, trihexyphenidyl hydrochloride 2 mg, net price 84-tab pack = £19.60; 5 mg, 84-tab pack = £18.59. 100-tab pack = £15.60. Counselling, with or after food, driving, see notes above

Broflex® (Alliance) (Non-proprietary)
Tablets, trihexyphenidyl hydrochloride 2 mg, net price 42-tab pack = £7.54. Counselling, driving, see notes above

Kemadrin® (Aspen) (Non-proprietary)
Tablets, scored, procyclidine hydrochloride 5 mg, net price 100-tab pack = £4.72. Counselling, driving, see notes above

PROCYCLIDINE HYDROCHLORIDE

Indications parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Pregnancy use only if potential benefit outweighs risk

Breast-feeding no information available

Side-effects see notes above, but causes sedation rather than stimulation; also gingivitis

Dose

- By mouth, 2.5 mg 3 times daily, increased gradually in steps of 2.5–5 mg daily every 2–3 days if necessary; usual max. 30 mg daily in 2–4 divided doses (60 mg daily in exceptional circumstances); ELDERLY preferably lower end of range

- By intramuscular or intravenous injection, acute dystonia, 5–10 mg (occasionally more than 10 mg), usually effective in 5–10 minutes but may need 30 minutes for relief; ELDERLY preferably lower end of range

Procyclidine (Non-proprietary)
Tablets, procyclidine hydrochloride 5 mg, net price 28-tab pack = £2.77. Counselling, driving, see notes above

Arpicolin® (Rosemont) (Non-proprietary)
Tablets, sugar-free, procyclidine hydrochloride 2.5 mg/5 mL, net price 150 mL = £4.22. 5 mg/5 mL, 150 mL pack = £7.54. Counselling, driving, see notes above

Kemadrin® (Asten)(Rosemont) (Non-proprietary)
Tablets, scored, procyclidine hydrochloride 5 mg, net price 100-tab pack = £4.72. Counselling, driving, see notes above

4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders

Tetrazenazine is mainly used to control movement disorders in Huntington's chorea and related disorders. Tetrabenazine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It may act by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol (p. 219) can improve motor tics and symptoms of Tourette syndrome and related choras. Other treatments for Tourette syndrome include pimozide (p. 220) [unlicensed indication] important: ECG monitoring required, clonidine (p. 278) [unlicensed indication], and sulpiride (p. 221) [unlicensed indication].

Trihexyphenidyl (above) in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks, to 20 to 30 mg daily or higher. Chlorpromazine (p. 218) and haloperidol (p. 219) are used to relieve intractable hiccup.

Propranolol or another beta-adrenergic blocking drug (section 2.4) may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis.
4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders BNF 61

Primidone (p. 288) in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects. Piracetam is used as an adjunctive treatment for myoclonus of cortical origin. Riluzole is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

---

**PIRACETAM**

**Indications**
adjunctive treatment of cortical myoclonus

**Cautions**
avoid abrupt withdrawal; elderly; haemostasis, major surgery, or severe haemorrhage

**Contra-indications**
cerebral haemorrhage; Huntington’s chorea

**Hepatic impairment**
avoid

**Renal impairment**
use two-thirds of normal dose if eGFR 50–80 mL/minute/1.73 m²; use one-third of normal dose in 2 divided doses if eGFR 30–50 mL/minute/1.73 m²; use one-sixth normal dose as a single dose if eGFR 20–30 mL/minute/1.73 m²; avoid if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy**
avoid

**Breast-feeding**
avoid

**Side-effects**
weight gain, nervousness, hypokinesia; less commonly drowsiness, depression, asthenia; also reported abdominal pain, nausea, vomiting, diarrhoea, headache, anxiety, confusion, hallucination, vertigo, ataxia, insomnia, and rash

**Dose**
- Initially 7.2 g daily in 2–3 divided doses, increased according to response by 4.8 g daily every 3–4 days to max. 20 g daily (subsequently, attempts should be made to reduce dose of concurrent therapy); CHILD under 16 years not recommended
- Oral solution Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.

Nootropil® (UCB Pharma) ³
Tablets, f/c, scored, piracetam 800 mg, net price 90-tab pack = £11.75; 1.2 g, 60-tab pack = £10.97. Label: 3

Oral solution, piracetam, 333.3 mg/mL, net price 300-mL pack = £16.31. Label: 3

---

**RILUZOLE**

**Indications**
to extend life in patients with amyotrophic lateral sclerosis, initiated by specialists experienced in the management of motor neurone disease

**Cautions**
history of abnormal hepatic function (consult product literature for details)

**Blood disorders**
Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur; white blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole

**Interstitial lung disease**
Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed

**Driving**
Dizziness or vertigo may affect performance of skilled tasks (e.g. driving)

**Hepatic impairment**
avoid; see also under Cautions

**Renal impairment**
avoid—no information available

**Pregnancy**
avoid—no information available

**Breast-feeding**
avoid—no information available

**Side-effects**
nausea, vomiting, diarrhoea, abdominal pain; tachycardia; asthenia, headache, dizziness, drowsiness, oral paraesthesia; less commonly interstitial lung disease, pancreatitis, angioedema, and anaemia; rarely neutropenia; very rarely hepatitis

**Dose**
- 50 mg twice daily; CHILD not recommended

Rilutek® (Sanofi-Aventis) ³
Tablets, f/c, riluzole 50 mg. Net price 56-tab pack = £278.55. Counselling, blood disorders, driving, see Cautions

---

**TETRABENAZINE**

**Indications**
see Dose

**Cautions**
interactions: Appendix 1 (tetrabenazine)

**Driving**
May affect performance of skilled tasks (e.g. driving)

**Pregnancy**
inadequate information but no evidence of harm

**Breast-feeding**
avoid

**Side-effects**
drowsiness, gastrointestinal disturbances, depression, extrapyramidal dysfunction, hypotension; rarely parkinsonism; neuroleptic malignant syndrome reported

**Dose**
- Movement disorders due to Huntington’s chorea, hemiballismus, senile chorea, and related neurological conditions, initially 12.5 mg twice daily (elderly 25 mg daily) gradually increased to 12.5–25 mg 3 times daily, max. 200 mg daily
- Moderate to severe tardive dyskinesia, initially 12.5 mg daily, gradually increased according to response

Xenazine® 25 (Alliance) ³
Tablets, yellow, scored, tetrabenazine 25 mg. Net price 112-tab pack = £100.00. Label: 2

---

**Torsion dystonias and other involuntary movements**

Botulinum toxin type A should be used under specialist supervision.

Botox® and Dysport® are licensed for the treatment of focal spasticity (including arm symptoms in conjunction with physiotherapy, dynamic equinus foot deformity caused by spasticity in ambulant paediatric cerebral palsy patients over 2 years, and hand and wrist disability associated with stroke), blepharospasm, hemifacial spasm, and spasmodic torticolis. Botox® is also licensed for severe hyperhidrosis of the axillae, and for the prophylaxis of headaches in adults with chronic migraine (section 4.7.4.2).

Azulfidine®, Bocouture®, and Vistabe® are licensed for the temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years.
Xeomin® is licensed for the treatment of blepharospasm, spasmodic torticollis, and post-stroke spasticity of the upper limb.

**BOTULINUM TOXIN TYPE A**

**Indications** see notes above; preparations are not interchangeable and should be used under specialist supervision

**Cautions** history of dysphagia or aspiration; chronic respiratory disorder; neurological disorders (can lead to increased sensitivity and exaggerated muscle weakness)

**Specific cautions for blepharospasm or hemifacial spasm** Caution if risk of angle-closure glaucoma; reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VIIth nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed

**Contra-indications** generalised disorders of muscle activity (e.g. myasthenia gravis); injection at injection site

**Pregnancy** low risk of systemic absorption but avoid unless essential

**Breast-feeding** low risk of systemic absorption but avoid unless essential

**Side-effects** increased electrophysiologic jitter in some distant muscles; misplaced injections may paralyse nearby muscle groups and excessive doses may paralyse distant muscles; influenza-like symptoms; rarely arrhythmias, myocardial infarction, seizures, and antibody formation (substantial deterioration in response); very rarely exaggerated muscle weakness, dysphagia, and aspiration (seek medical attention if swallowing, speech, or respiratory disorders)

**Specific side-effects for blepharospasm or hemifacial spasm** ptosis, keratitis, lagophthalmos, dry eye, irritation, photophobia, lacrimation, facial oedema, less commonly dry mouth, facial weakness (including drooping), dizziness, paraesthesia, headache, tiredness, entropion, dry mouth, dyspepsia, worsening torticollis, neck pain, myasthenia, voice changes, taste disturbances; very rarely eyelid bruising and swelling (minimized by applying gentle pressure at injection site immediately after injection); very rarely angle-closure glaucoma, corneal ulceration

**Specific side-effects in paediatric cerebral palsy** drowsiness, paraesthesia, urinary incontinence, myalgia

**Specific side-effects for temporary improvement of moderate to severe wrinkles between the eyebrows** facial oedema, headache, ptosis, less commonly nausea, dry mouth, dizziness, asthenia, paraesthesia, muscle cramp, visual disturbances, tinnitus, blepharitis, photo-sensitivity reactions, and dry skin

**Specific side-effects in spasmodic torticollis** dysphagia and pooling of saliva (occurs most frequently after injection into sternomastoid muscle), nausea, dry mouth, rhinitis, drowsiness, headache, dizziness, malaise, numbness, stiffness, hyperemia; back pain, weakness; less commonly diarrhoea, vomiting, colitis, dyspepsia, voice alteration, tremor, skeletal pain, myalgia, diplopia, eye pain, ptosis, and sweating

**Specific side-effects in axillary hyperhidrosis** non-axillary sweating, hot flushes; less commonly myalgia and joint pain

**Specific side-effects in focal upper-limb spasticity associated with stroke** dysphagia, hypertension, purpura, less commonly nausea, dry mouth, cough, haematoxia, peripheral oedema, depression, insomnia, vertigo, arm weakness, malaise, paraesthesia, dysaesthesia, headache, pain in extremities, arthralgia, and bucrisis

**Dose**

- Consult product literature (important: specific to each individual preparation and not interchangeable)

---

**BOTULINUM TOXIN TYPE B**

**Indications** spasmodic torticollis (cervical dystonia)—specialist use only

**Cautions** history of dysphagia or aspiration; inadvertent injection into a blood vessel; tolerance may occur

**Contra-indications** neuromuscular or neuromuscular junctional disorders

**Pregnancy** low risk of systemic absorption but avoid unless essential

**Breast-feeding** low risk of systemic absorption but avoid unless essential

**Side-effects** increased electrophysiologic jitter in some distant muscles; dry mouth, dyspepsia, worsening torticollis, neck pain, myasthenia, voice changes, taste disturbances; very rarely exaggerated muscle weakness, dysphagia, and aspiration (seek medical attention if swallowing, speech, or respiratory disorders)

**Dose**

- By intramuscular injection, initially 5000–10 000 units divided between 2–4 most affected muscles; adjust dose and frequency according to response; important: not interchangeable with other botulinum toxin preparations

**NeuroBloc** *(Eisai)*

**Injection** botulinum toxin type B 5000 units/mL, net price 0.5-mL vial = £111.20; 1-mL vial = £148.27; 2-mL vial = £197.69

**Note** May be diluted with sodium chloride 0.9%

---

**4.10 Drugs used in substance dependence**

This section includes drugs used in alcohol dependence, cigarette smoking, and opioid dependence.

4 Central nervous system

4.10.1 Alcohol dependence

Excessive drinking of alcoholic beverages over a prolonged period of time can result in an alcohol withdrawal syndrome on abrupt cessation of, or marked reduction in, drinking; for some patients the withdrawal syndrome can be severe and even fatal.

Acute alcohol withdrawal. Long-acting benzodiazepines, usually chlordiazepoxide (p. 214), are used to attenuate alcohol withdrawal symptoms. In primary care, fixed-dose reducing regimens are usually used, whilst a symptom-triggered flexible regimen is used in hospital or other settings where continued assessment and monitoring is carried out for 24–48 hours, usually followed by a fixed 5-day reducing dose schedule. Patients with decompensated liver disease should be treated under specialist supervision.

Carbamazepine [unlicensed indication] (p. 281) is sometimes used as an alternative treatment in acute alcohol withdrawal when benzodiazepines are contra-indicated or not tolerated. Clomethiazole (p. 211) is licensed for use in acute alcohol withdrawal, but benzodiazepines are preferred. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol.

Patients with marked agitation or hallucinations and those at risk of delirium tremens (characterised by delirium, hallucinations, course tremor, and disorientation) may be prescribed antipsychotic drugs, such as haloperidol (p. 219) or olanzapine (p. 224) [unlicensed indication], as adjunctive therapy to benzodiazepines; antipsychotics should not be used alone because they do not treat alcohol withdrawal and may lower the seizure threshold. Delirium tremens is a medical emergency that requires specialist inpatient care.

If a patient taking a benzodiazepine as part of a withdrawal regimen develops alcohol withdrawal seizures, a fast-acting benzodiazepine (such as intravenous lorazepam [unlicensed indication] (p. 296) or rectal diazepam (p. 295)) should be prescribed; thereafter an increase in the dose of oral benzodiazepine should be considered to prevent further seizures from occurring.

Alcohol dependence. Acamprosate and disulfiram are effective treatments for relapse prevention in patients with alcohol dependence (see below).

Patients with alcohol dependence are at risk of developing Wernicke’s encephalopathy; patients at high-risk are those who are malnourished, at risk of malnutrition, or have decompensated liver disease. Parenteral thiamine (as Pabrinex®, section 9.6.2) should be prescribed for treatment of suspected or confirmed Wernicke’s encephalopathy, and for prophylaxis in alcohol-dependent patients attending hospital for acute treatment (including treatment unrelated to alcohol dependence); parenteral prophylaxis may also be considered for high-risk patients being treated in primary care. High-dose oral thiamine (p. 616) should be prescribed following parenteral treatment until cognitive function is maximised. In primary care, prophylactic high-dose oral thiamine should be prescribed during acute withdrawal of alcohol, before planned withdrawal, and for patients not undergoing withdrawal but who are at high-risk of developing Wernicke’s encephalopathy.

Patients with chronic alcohol-related pancreatitis who have symptoms of steatorrhoea or who have poor nutritional status due to exocrine pancreatic insufficiency should be prescribed pancreatic enzyme supplements (section 1.9.4); supplements are not indicated when pain is the only symptom.

Corticosteroids (section 6.3.2) are used in patients with severe acute alcohol-related hepatitis.

Acamprosate

Acamprosate, in combination with counselling, may be helpful for maintaining abstinence in alcohol-dependent patients. It is useful for patients who are concerned that strong cravings will result in relapse. It should be initiated as soon as possible after abstinence has been achieved and continued for 1 year; treatment should be maintained if the patient has a temporary relapse. Acamprosate is not effective in all patients, so efficacy should be regularly assessed.

Disulfiram

Disulfiram is used as an adjunct in the treatment of alcohol dependence (under specialist supervision). It gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol because it causes accumulation of acetaldehyde in the body; it is only effective if taken daily. Symptoms can occur within 10 minutes of ingesting alcohol and include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse; these reactions can last several hours. Small amounts of alcohol such as those included in many oral medicines may be sufficient to precipitate a reaction—even toiletries and mouthwashes that contain alcohol should be avoided. Alcohol should be avoided for at least 1 week after stopping treatment.

Before initiating disulfiram, prescribers should evaluate the patient’s suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.
4.10.2 Nicotine dependence

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support.

Therapy to aid smoking cessation is chosen according to the smoker's likely compliance, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the products, and the smoker's preferences. Nicotine replacement therapy, bupropion, and varenicline are effective aids to smoking cessation. The use of nicotine replacement preparations in an individual who is already accustomed to nicotine introduces few new risks and it is widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some patients benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations. The combination of nicotine replacement therapy with varenicline or bupropion is not recommended.

Concomitant medication Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline (p. 181), cinacalcet (p. 610), ropinirole (p. 301), and some antipsychotics (including clozapine (p. 223), olanzapine (p. 224), chlorpromazine (p. 218), and haloperidol (p. 219)), may need to be reduced. Regular monitoring for adverse effects is advised.

**Bupropion**

Bupropion has been used as an antidepressant but its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission.

**BUPROPION HYDROCHLORIDE**

(Bupropion; Amfebutamone hydrochloride)

**Indications** see notes above

**Cautions** elderly; predisposition to seizures (prescribe only if benefit clearly outweighs risk) including concomitant use of drugs that lower seizure threshold, alcohol abuse, history of head trauma, and diabetes; measure blood pressure before and during treatment; avoid in severe hepatic cirrhosis; CNS tumour; history of seizures, eating disorders, or bipolar disorder

**Hepatic impairment** reduce dose to 150 mg daily; avoid in severe hepatic cirrhosis

**Renal impairment** reduce dose to 150 mg daily

**Pregnancy** avoid—no information available

**Breast-feeding** present in milk—avoid

**Side-effects** dry mouth, gastro-intestinal disturbances, taste disturbance; agitation, anxiety, dizziness, depression, headache, impaired concentration, insomnia (reduced by avoiding dose at bedtime), tremor; fever; pruritus, rash; sweating; loss commonly chest pain, flushing, hypertension, tachycardia, anorexia, asthenia, confusion, tinnitus, and visual disturbances; rarely hepatitis, jaundice, palpitation, postural hypotension, vasodilatation, abnormal dreams, ataxia, dystonia, depersonalisation, hallucinations, hostility, incoordination, irritability, impaired memory, parasthesia, seizures, twitching, blood-glucose changes, urinary frequency, urinary retention, exacerbation of psoriasis, and Stevens-Johnson syndrome; very rarely aggression, delusions, paranoid ideation, and restlessness; also reported suicidal ideation

**Dose**

- **ADULT** over 18 years, start 1–2 weeks before target stop date, initially 150 mg daily for 6 days then 150 mg twice daily (max. single dose 150 mg, max. daily dose 300 mg; minimum 8 hours between doses); period of treatment 7–9 weeks; discontinue if abstinence not achieved at 7 weeks; consider max. 150 mg daily in patients with risk factors for seizures; **ELDERLY** max. 150 mg daily

**Zyban®** (GSK) Tablets, m/r, f/c, bupropion hydrochloride 150 mg, net price 60-tab pack = £47.82. Label: 25, counselling, driving, see Cautions

**Nicotine replacement therapy**

Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in...
advancing of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

**Choice** Nicotine patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If patients experience strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray) are used whenever the urge to smoke occurs.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit from using a combination of immediate-release preparation and patches to achieve abstinence.

All preparations are licensed for adults and children over 12 years (with the exception of Nicotinell® lozenges which are licensed for children under 18 years only when recommended by a doctor).

**Cautions** Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations. Nicotine replacement therapy should be used with caution in haemodynamically unstable patients hospitalised with severe arrhythmias, myocardial infarction, or cerebrovascular accident, and in patients with phaeochromocytoma or uncontrolled hyperthyroidism. Care is also needed in patients with diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment.

Specific cautions for individual preparations are usually related to the local effect of nicotine. Oral preparations should be used with caution in patients with oesophagitis, gastritis, or peptic ulcers because swallowed nicotine can aggravate these conditions. The gum may also stick to and damage dentures. Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy. Care should be taken with the inhalation cartridges in patients with obstructive lung disease, chronic throat disease, or bronchospastic disease. The nasal spray can cause worsening of bronchial asthma. Patches should not be placed on broken skin and should be used with caution in patients with skin disorders.

**Hepatic impairment** Nicotine replacement therapy should be used with caution in moderate to severe hepatic impairment.

**Renal impairment** Nicotine replacement therapy should be used with caution in severe renal impairment.

**Pregnancy** The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable over patches but avoid liquorice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.

**Breast-feeding** Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

**Side-effects** Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

Mild topical reactions at the beginning of treatment are common because of the irritant effect of nicotine. _Oral preparations and inhalation cartridges can cause irritation of the throat, gum and lozenges can cause increased salivation, and patches can cause minor skin irritation._ The _nasal spray_ commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of lozenges, patches and sublingual tablets. _Lozenges_ cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. Palpitations may occur with nicotine replacement therapy and rarely patches can cause arrhythmia. _Patches_ and _lozenges_ can cause chest pain.

Abnormal dreams can occur with patches; removal of the patch before bed may help. _Lozenges_ may cause hot flushes; sweating, arthralgia, and myalgia can occur with _patches_.

**Nicotine medicated chewing gum** Individuals who smoke fewer than 20 cigarettes each day should use one piece of 2-mg strength gum when the urge to smoke occurs; individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day should use the 4-mg strength. Patients should not exceed 15 pieces of 4-mg strength gum daily. If attempting _smoking_ cessation, treatment should continue for 3 months before reducing the dose.

**Administration** Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

**Nicotine inhalation cartridge** The cartridges can be used when the urge to smoke occurs or to prevent cravings, up to a maximum of 12 cartridges daily.

**Administration** Insert the cartridge into the device and draw in air through the mouthpiece. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single cartridge lasts for approximately 20 minutes of intense use.

**Nicotine lozenge** One lozenge should be used every 1–2 hours when the urge to smoke occurs. Individuals
who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the low-strength lozenges should use the higher-strength lozenges. Patients should not exceed 15 lozenges daily. If attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose.

**Administration** Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.

**Nicotine transdermal patches** As a general guide for smoking cessation, individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks. A slower titration schedule can be used in patients who are not ready to quit but want to reduce cigarette consumption before a quit attempt.

If abstinence isn’t achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised. Patients using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks.

**Administration** Patches should be applied on waking to help smoking cessation, treatment should continue for up to 3 months before reducing the dose.

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- See notes above

**Nicorette**<sup>®</sup> (McNeil)<br>Tablets (sublingual) (Nicorette Microtab<sup>®</sup>), nicotine (as a cyclodextrin complex) 2 mg, net price starter pack of 2 × 15-tablet discs with dispenser = £4.46; pack of 100 = £12.12. Label: 26

**Note** Also available in lemon flavour, also available as NicAssist<sup>®</sup>

**Excipients** lemon flavour includes aspartame (section 9.4.1)

**Chewing gum**, sugar-free, nicotine (as resin) 2 mg, net price pack of 30 = £3.41, pack of 105 = £9.37, pack of 210 = £14.82; 4 mg, pack of 30 = £3.99, pack of 105 = £11.48, pack of 210 = £18.24

**Note** Also available in mint, freshfruit, freshmint, and icy white flavours. Also available as NicAssist<sup>®</sup>

**Note** Nicorette<sup>®</sup>Combifit patch + gum (containing Invisi patches 15 mg and Icy White gum 2 mg) also available

**Patches**, self-adhesive, beige, nicotine, ‘5 mg’ patch (releasing approx. 5 mg/16 hours), net price 7 = £9.07; ‘10 mg’ patch (releasing approx. 10 mg/16 hours), net price 7 = £9.07; ‘15 mg’ patch (releasing approx. 15 mg/16 hours), 2 = £2.85, 7 = £9.07

**Note** Also available as NicAssist<sup>®</sup>

**Invisi** patches, self-adhesive, beige, nicotine, ‘10 mg’ patch (releasing approx. 10 mg/16 hours), net price 7 = £9.97; ‘15 mg’ patch (releasing approx. 15 mg/16 hours), 7 = £9.97; ‘25 mg’ patch (releasing approx. 25 mg/16 hours), 7 = £9.97

**Note** Nicorette<sup>®</sup>Combifit patch + gum (containing Invisi patches 15 mg and Icy White gum 2 mg) also available

**Nasal spray**, nicotine 500 microgram/metered spray, net price 200-spray unit = £13.40

**Note** Also available as NicAssist<sup>®</sup>

**Inhalator** (nicotine-impregnated plug for use in inhalator mouthpiece), nicotine 10 mg/cartridge, net price 6-cartridge (starter) pack = £4.46, 42-cartridge (refill) pack = £14.01. Counselling, administration, see notes above

### 4.10.3 Opioid dependence

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber.

Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at 36–72 hours; symptoms subside substantially after 5 days. Methadone or buprenorphine withdrawal occurs later, with longer-lasting symptoms.

#### Varenicline

Varenicline is a selective nicotine-receptor partial agonist used as an aid for smoking cessation.

**Indications** see notes above

**Cautions** risk of relapse, irritability, depression, and insomnia on discontinuation (consider dose tapering on completion of 12-week course); history of psychiatric illness (may exacerbate underlying illness including depression)

**MHRA/CHM advice**

**Suicidal behaviour and varenicline**

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation, depressed mood, or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline.

**Renal impairment** if eGFR less than 30 mL/minute/1.73 m², initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** present in milk in animal studies

**Side-effects** gastro-intestinal disturbances, appetite changes, dry mouth, taste disturbance; headache, drowsiness, dizziness, sleep disorders, abnormal dreams; less commonly thirst, weight gain, anphotheatosis, gingival pain, chest pain, hypertension, tachycardia, atrial fibrillation, palpitation, panic attack, mood swings, dysarthria, asthma, tremor, incoordination, hyperesthesia, restlessness, hypoesthesia, impaired temperature regulation, menorrhagia, vaginal discharge, sexual dysfunction, dysuria, arthralgia, muscle spasm, visual disturbances, eye pain, lacrimation, tinnitus, acne, sweating, rash, and pruritus; myocardial infarction, anxiety, depression, aggression, irrational behaviour, psychosis, suicidal ideation (see MHRA/CHM advice above), and Stevens-Johnson syndrome also reported

**Dose**

- **ADULT** over 18 years, start 1–2 weeks before target stop date, initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks (reduce to 500 micrograms twice daily if not tolerated); 12-week course can be repeated in abstinent individuals to reduce risk of relapse

**Champix® (Pfizer)**

 Tablets, f/c, varenicline (as tartrate) 500 micrograms (white), net price 56-tab pack = £54.60; 1 mg (blue)

28-tab pack = £27.30, 56-tab pack = £54.60; starter pack of 11 × 500-microgram tabs with 14 × 1-mg tabs = £27.30. Label: 3

---

**Missed doses**

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients.

If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine, because of the risk of precipitated withdrawal.
Buprenorphine Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties). Buprenorphine is preferred by some patients because it is less sedating than methadone; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone before induction with naltrexone for prevention of relapse (p. 317).

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal may occur in any patient if buprenorphine is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine (p. 317), may be required if symptoms are severe.

The first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone therapy—but care is still needed to avoid toxicity or precipitated withdrawal, dividing the dose on the first day may be useful.

In patients taking methadone who want to switch to buprenorphine, the dose of methadone should be reduced to a maximum of 30 mg daily before starting buprenorphine treatment. If the dose of methadone is over 10 mg daily, buprenorphine can be started at a dose of 4 mg daily and titrated according to requirements; if the methadone dose is below 10 mg daily, buprenorphine can be started at a dose of 2 mg daily.

Buprenorphine should not normally be used in patients with liver dysfunction. Baseline liver function tests and documentation of viral hepatitis status is recommended prior to commencing therapy, and regular liver function tests should be performed throughout treatment.

A combination preparation containing buprenorphine with naloxone (Suboxone®, p. 316) can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

**Methadone** Methadone, a long-acting opioid agonist, is usually administered in a single daily dose as methadone oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a mixture of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone to buprenorphine because it has a more pronounced sedative effect.

Methadone is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, blood levels progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma levels to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus, titration to the optimal dose in methadone maintenance treatment may take several weeks.

**Pregnancy** Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued [buprenorphine is not licensed for use in pregnancy]. Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone or buprenorphine should be undertaken gradually during the second trimester; for example, the dose of methadone may be reduced by 2–3 mg every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute. Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective suckling, and excessive wakefulness; severe but rare, symptoms include hypertonicity and convulsions.
Breast-feeding  The dose of methadone should be kept as low as possible in breast-feeding mothers and the infant should be monitored for sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate). Buprenorphine is excreted in low levels in breast milk and has low oral bioavailability; however, neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

Increased sleepiness, breathing difficulties, or limpness should be monitored for drowsiness, adequate weight gain, and has low oral bioavailability; however, neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

Buprenorphine is excreted in low levels in breast milk (with naloxone) and is for drug dependent persons (see also p. 8).

METHADONE HYDROCHLORIDE

Indications  adjunct in treatment of opioid dependence; premedication, peri-operative analgesia, analgesia in other situations (section 4.7.2).

Cautions  see Methadone, section 4.7.2.

Contra-indications  see Methadone, section 4.7.2.

Hepatic impairment  see notes in section 4.7.2.

Renal impairment  see notes in section 4.7.2.

Pregnancy  see notes above.

Breast-feeding  see notes above.

Side-effects  see Methadone, section 4.7.2; overdose: see Emergency Treatment of Poisoning, p. 36.

Important  Methadone, even in low doses is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

Incompatibility  Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

Dose  Initially 10–40 mg daily, increased by up to 10 mg daily (max. weekly increase 150 mg) until no signs of withdrawal or intoxication; usual dose range 60–120 mg daily; CHILD not recommended (see also important note above).

Note  Methadone hydrochloride doses in the BNF may differ from those in the product literature.

Methadone (Non-proprietary)

Oral solution 1 mg/mL, methadone hydrochloride 1 mg/mL, net price 20 mL = £0.89, 30 mL = £2.42, 40 mL = £7.20, 50 mL = £10.00, 80 mL = £17.00, 100 mL = £22.76, 200 mL = £45.00, 500 mL = £113.34. Label: 2

Brands include Methadone® (sugar-free), Physeptone (sugar-free).

Important  Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (section 3.9.1). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

Injection, methadone hydrochloride 25 mg/mL, net price 2-mL amp = £2.05; 50 mg/mL, 1-mL amp = £2.05.

Brands include Synastone®.

Methadose® (Rosemont)

Oral concentrate, methadone hydrochloride 10 mg/mL (blue), net price 150 mL = £12.01, 20 mg/mL (brown), 150 mL = £24.02. Label: 2

Note  The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription.

Important  Care is required in prescribing and dispensing the correct strength since any confusion could lead to an overdose; this preparation should be dispensed only after dilution as appropriate with Methadose® Diluent (life of diluted solution 3 months) and is for drug dependent persons (see also p. 8).

Adjunctive therapy and symptomatic treatment

Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide (p. 58) may be used for the control of diarrhoea; mebeverine (p. 48) for controlling stomach cramps; paracetamol (p. 259) and non-steroidal anti-inflammatory drugs (p. 630) for muscular pains and headaches; metoclopramide (p. 253) or prochlorperazine (p. 252) may be useful for nausea or vomiting. Topical rubefacients (p. 664) can be helpful for relieving muscle pain associated with methadone withdrawal. If a patient is suffering from insomnia, benzodiazepines (section 4.1) or zopiclone (p. 210) may be prescribed, but because of
the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

**Lofexidine** Lofexidine is an alpha-2-adrenergic agonist. It may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute, or during withdrawal of the opioid substitute. Alternatively, lofexidine may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use. The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal. Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation; treatment should be discontinued gradually over 2–4 days to reduce the risk of rebound hypertension.

**LOFEXIDINE HYDROCHLORIDE**

**Indications** management of symptoms of opioid withdrawal

**Cautions** severe coronary insufficiency, recent myocardial infarction, cerebrovascular disease, bradycardia, hypotension (monitor pulse rate and blood pressure); history of QT prolongation, concomitant administration of drugs that prolong QT interval, metabolic disturbances; withdraw gradually over 2–4 days (or longer) to minimise risk of rebound hypertension and associated symptoms; depression; interaction: Appendix 1 (lofexidine)

**Renal impairment** caution in chronic impairment

**Pregnancy** use only if benefit outweighs risk—no information available

**Breast-feeding** use only if benefit outweighs risk—no information available

**Side-effects** dry mucous membranes; hypotension, bradycardia; dizziness, drowsiness; QT-interval prolongation also reported

**Dose**

- Initially, 800 micrograms daily in divided doses, increased as necessary in steps of 400–800 micrograms daily to max. 2.4 mg daily in divided doses; max. single dose 800 micrograms; recommended duration of treatment 7–10 days if no opioid use (but longer may be required)

**BritLofex** (Genus) Tablets, peach, f/c, lofexidine hydrochloride 200 micrograms, net price 60-tab pack = £61.79. Label: 2

**Opioid-receptor antagonists**

Naloxone is an opioid-receptor antagonist used to reverse opioid overdose. Patients dependant on opioids can be given a supply of naloxone to be used in case of accidental overdose; see Emergency Treatment of Poisoning, p. 36.

Naltrexone is an opioid-receptor antagonist that precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists are blocked by naltrexone, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

**NICE guidance**

**Naltrexone for the management of opioid dependence (January 2007)**

Naltrexone is recommended for the prevention of relapse in formerly opioid-dependent patients who are motivated to remain in a supportive care abstinence programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly.

**NALTREXONE HYDROCHLORIDE**

**Indications** adjunct to prevent relapse in formerly opioid-dependent patients (who have remained opioid-free for at least 7–10 days)

**Cautions** liver function tests needed before and during treatment; test for opioid dependence with naltrexone before treatment; avoid concomitant use of opioids but increased dose of opioid analgesic may be required for pain (monitor for opioid intoxication)

**Note** Patients should be warned that an attempt to overcome the blockade of opioid receptors by overdosing could result in acute opioid intoxication

**Contra-indications** patients currently dependent on opioids

- **Hepatic impairment** avoid in acute hepatitis, hepatic failure, or severe impairment

- **Renal impairment** avoid in severe impairment

- **Pregnancy** use only if benefit outweighs risk

- **Breast-feeding** avoid—present in milk in animal studies

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, constipation, reduced appetite, increased thirst; chest pain; anxiety, sleep disorders, headache, depression; reduced energy, increased energy, irritability, emotional lability, dizziness; chills; urinary retention; delayed ejaculation, decreased potency; arthralgia, myalgia; increased laceration; rash; and increased sweating; rarely hepatic dysfunction, suicidal ideation, and speech disorders; very rarely hallucinations, tremor, and idiopathic thrombocytopenia

**Dose**

- **ADULT** over 18 years (initiate in specialist clinics only), 25 mg initially then 50 mg daily; total weekly dose (350 mg) may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday)

**Naloxone** (Bristol-Myers Squibb) Tablets, yellow, f/c, scored, naltrexone hydrochloride 50 mg, net price 28-tab pack = £23.00

**Opizone** (Genus) Tablets, beige, f/c, scored, naltrexone hydrochloride 50 mg, net price 28-tab pack = £22.34

**Opizone** (Genus) Tablets, beige, f/c, scored, naltrexone hydrochloride 50 mg, net price 28-tab pack = £23.00

**Opizone** (Genus) Tablets, beige, f/c, scored, naltrexone hydrochloride 50 mg, net price 28-tab pack = £23.00

**4.11 Drugs for dementia**

Acetylcholinesterase inhibiting drugs are used in the treatment of Alzheimer’s disease, specifically for mild to moderate disease. Rivastigmine is also licensed for
4.11 Drugs for dementia

DONEPEZIL HYDROCHLORIDE

**Indications**  mild to moderate dementia in Alzheimer’s disease

**Cautions** sick sinus syndrome or other supraventricular conduction abnormalities; susceptibility to peptic ulcers; asthma, chronic obstructive pulmonary disease; interactions: Appendix 1 (parasympathomimetics)

**Hepatic impairment** caution in mild to moderate impairment, no information available for severe impairment

**Side-effects** nausea, vomiting, anorexia, diarrhoea; fatigue, insomnia, headache, dizziness, syncope, hallucinations, agitation, aggression; muscle cramps; urinary incontinence; rash, pruritus; less commonly gastric and duodenal ulcers, gastro-intestinal haemorrhage, bradycardia, seizures; rarely sino-atrial block, AV block, hepatitis, extrapyramidal symptoms; potential for bladder outflow obstruction

**Dose**
- Initially 5 mg once daily at bedtime, increased if necessary after one month to max. 10 mg daily

**Aricept®** (Eisai)®

- **Tablets,** f/c, donepezil hydrochloride 5 mg (white), net price 28-tab pack = £59.85; 10 mg (yellow), 28-tab pack = £83.89.

**Aricept Evess®** (Eisai)®

- **Orodispersible tablets,** donepezil hydrochloride 5 mg (white), net price 28-tab pack = £59.85; 10 mg (yellow), 28-tab pack = £83.89. Counselling, administration

**Counselling**  Aricept Evess® should be placed on the tongue, allowed to disperse, and swallowed

---

**NICE guidance**

**Donepezil, galantamine, rivastigmin, and memantine for Alzheimer’s disease (August 2009)**

Donepezil, galantamine, and rivastigmine can be used for the treatment of moderate Alzheimer’s disease in patients whose mini mental-state examination (MMSE) score is 10–20 points under the following conditions:
- Alzheimer’s disease must be diagnosed in a specialist clinic; cognitive, global, and behavioural functioning, activities of daily living, and the likelihood of compliance with treatment must be assessed;
- treatment should be initiated by specialists but can be continued by general practitioners under a shared-care protocol;
- the carers’ views of the condition should be sought before and during treatment;
- the patient should be assessed every 6 months and drug treatment should continue only if the MMSE score remains at or above 10 points and if treatment is considered to have a worthwhile effect on the global, functional, and behavioural condition.

Healthcare professionals should not rely solely on the MMSE score to assess the severity of Alzheimer’s disease when the patient has learning or other disabilities, or other communication difficulties. NICE does not recommend initiation of memantine for Alzheimer’s disease except as part of clinical studies.

---

**GALANTAMINE**

**Indications**  mild to moderate dementia in Alzheimer’s disease

**Cautions** cardiac disease (including sick sinus syndrome or other supraventricular conduction abnormalities, unstable angina, congestive heart failure); electrolyte disturbances; susceptibility to peptic ulcers; asthma, chronic obstructive pulmonary disease, pulmonary infection; avoid in urinary retention, gastro-intestinal obstruction, and while recovering from bladder or gastro-intestinal surgery; interactions: Appendix 1 (parasympathomimetics)

**Hepatic impairment**
- for immediate-release preparations in moderate impairment, initially 4 mg once daily (preferably in the morning) for at least 7 days, then 4 mg twice daily for at least 4 weeks; max. 8 mg twice daily; avoid in severe impairment
- for modified-release preparations in moderate impairment, initially 8 mg on alternate days (preferably in the morning) for 7 days, then 8 mg once daily for 4 weeks; max. 16 mg daily; avoid in severe impairment

**Renal impairment**  avoid if eGFR less than 9 mL/minute/1.73m²

**Side-effects** vomiting, nausea, abdominal pain, diarrhoea, dyspepsia, anorexia, weight loss, bradycardia, hypertension, syncope, hallucination, depression, dizziness, tremor, headache, drowsiness, malaise, muscle spasm, sweating; less commonly taste disturbance, palpitation, arrhythmias, first-degree AV block,
hypotension, flushing, paraesthesia, dehydration, muscular weakness, blurred vision, tinnitus; rarely hepatitis, exacerbation of Parkinson’s disease, seizures

**Dose**
- Initially 4 mg twice daily for 4 weeks increased to 8 mg twice daily for 4 weeks; maintenance 8–12 mg twice daily

**Reminyl®** *(Shire)*
- **Tablets**, f/c, galantamine (as hydrobromide) 8 mg (pink), net price 56-tab pack = £68.32; 12 mg (orange-brown), 56-tab pack = £64.00. Label: 3, 21, 25
- **Oral solution**, galantamine (as hydrobromide) 4 mg/mL, net price 100 mL with pipette = £120.00. Label: 3, 21

**Cautions**
- moderate to severe dementia in Alzheimer’s disease
- monitor body-weight; sick sinus syndrome, anorexia, weight loss, increased salivation, abdominal pain, bradycardia, dizziness, headache, drowsiness, malaise, agitation, anxiety, restlessness, confusion, insomnia, extrapyramidal symptoms (and worsening of Parkinson’s disease), dehydration, sweating; less commonly atrial fibrillation, AV block, depression, syncope; rarely gastric and duodenal ulceration, angina, seizures, rash; very rarely gastro-intestinal haemorrhage, pancreatitis, tachycardia, hypertension, hallucinations

**Note** Transdermal administration less likely to cause gastrointestinal disturbance

**Dose**
- See under preparations

---

**MEMANTINE HYDROCHLORIDE**

**Indications** moderate to severe dementia in Alzheimer’s disease

**Cautions** history of convulsions; interactions: Appendix 1 (memantine)

**Hepatic impairment** avoid in severe impairment—no information available

**Renal impairment** reduce dose to 10 mg daily if eGFR 30–49 mL/minute/1.73 m², if well tolerated after at least 7 days dose can be increased in steps to 20 mg daily; reduce dose to 10 mg daily if eGFR 5–29 mL/minute/1.73 m²; avoid if eGFR less than 5 mL/minute/1.73 m²

**Side-effects** constipation; hypertension; dyspnoea; headache, dizziness, drowsiness; less commonly vomiting, thrombosis, heart failure, confusion, fatigue, hallucinations, and abnormal gait; very rarely seizures; pancreatitis, psychosis, depression, and suicidal ideation also reported

**Dose**
- Initially 5 mg once daily, increased in steps of 5 mg at weekly intervals; max. 20 mg daily

**Ebixa®** *(Lundbeck)*
- **Tablets**, f/c, scored, memantine hydrochloride 10 mg, net price 28-tab pack = £34.50, 56-tab pack = £69.01, 112-tab pack = £138.01; 20 mg, 28-tab pack = £69.01; treatment initiation pack, 7 × 5 mg, 7 × 10 mg, 7 × 15 mg, and 7 × 20 mg = £43.13
- **Oral solution**, memantine hydrochloride 5 mg/actuation (10 mg/mL), net price 50-g pump pack = £61.61, 100-g pump pack = £123.23
- **Counselling** Solution should be dosed onto a spoon or into a glass of water

**RIVASTIGMINE**

**Indications** mild to moderate dementia in Alzheimer’s disease or in Parkinson’s disease

**Cautions** gastric or duodenal ulcers (or susceptibility to ulcers); monitor body-weight; sick sinus syndrome, conduction abnormalities; history of asthma or chronic obstructive pulmonary disease; history of seizures; bladder outflow obstruction; interactions: Appendix 1 (parasympathomimetics)

**Hepatic impairment** use with caution; avoid in severe impairment

**Renal impairment** use with caution

**Side-effects** nausea, vomiting, diarrhoea, dyspepsia, anorexia, weight loss, increased salivation, abdominal pain, bradycardia, dizziness, headache, drowsiness, malaise, agitation, anxiety, restlessness, confusion, insomnia, extrapyramidal symptoms (and worsening of Parkinson’s disease), dehydration, sweating; less commonly atrial fibrillation, AV block, depression, syncope; rarely gastric and duodenal ulceration, angina, seizures, rash; very rarely gastro-intestinal haemorrhage, pancreatitis, tachycardia, hypertension, hallucinations

**Cautions** use with caution; avoid in severe impairment

**Renal impairment** use with caution

**Side-effects** nausea, vomiting, diarrhoea, dyspepsia, anorexia, weight loss, increased salivation, abdominal pain, bradycardia, dizziness, headache, drowsiness, malaise, agitation, anxiety, restlessness, confusion, insomnia, extrapyramidal symptoms (and worsening of Parkinson’s disease), dehydration, sweating; less commonly atrial fibrillation, AV block, depression, syncope; rarely gastric and duodenal ulceration, angina, seizures, rash; very rarely gastro-intestinal haemorrhage, pancreatitis, tachycardia, hypertension, hallucinations

**Note** Transdermal administration less likely to cause gastrointestinal disturbance

**Dose**
- See under preparations

**Exelon** *(Novartis)*
- **Capsules**, rivastigmine (as hydrogen tartrate) 1.5 mg (yellow), net price 28-cap pack = £33.25, 56-cap pack = £66.51; 3 mg (orange), 28-cap pack = £33.25, 56-cap pack = £66.51; 4.5 mg (red), 28-cap pack = £33.25, 56-cap pack = £66.51; 6 mg (red/orange), 28-cap pack = £33.25, 56-cap pack = £66.51. Label: 21, 25
- **Oral solution**, rivastigmine (as hydrogen tartrate) 2 mg/mL, net price 120 mL (oral syringe) = £99.14. Label: 21
- **Dose** initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily at intervals of at least 2 weeks according to response and tolerance; usual range 3–6 mg twice daily; max. 6 mg twice daily; if treatment interrupted for more than several days, treatment should be retarded from 1.5 mg twice daily

**Patches**, self-adhesive, beige, rivastigmine 4.6 mg/24 hours, net price 30 = £77.97; 9.5 mg/24 hours, 30 = £77.97
- **Dose** initially apply 4.6 mg/24 hours patch to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and using a replacement patch on a different area (avoid using the same area for 14 days); if well tolerated increase to 9.5 mg/24 hours patch daily after at least 4 weeks; if treatment interrupted for more than several days, treatment should be retarded from 4.6 mg/24 hours patch

**Note** When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch (then titrate as above); patients taking 9–12 mg by mouth daily should initially switch to 9.5 mg/24 hours patch daily after at least 4 weeks; if treatment interrupted for more than several days, treatment should be retarded from 4.6 mg/24 hours patch

**Note** When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch (then titrate as above); patients taking 9–12 mg by mouth daily should switch to 9.5 mg/24 hours patch daily after at least 4 weeks; if treatment interrupted for more than several days, treatment should be retarded from 4.6 mg/24 hours patch

**Note** The Scottish Medicines Consortium (p. 4) has advised (October 2007) that Exelon® patches should be restricted for use in patients with moderately severe Alzheimer’s disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation
5 Infections

5.1 Antibacterial drugs

5.1.1 Penicillins

5.1.1.1 Benzylpenicillin and phenoxy-methylpenicillin

5.1.1.2 Penicillinase-resistant penicillins

5.1.1.3 Broad-spectrum penicillins

5.1.1.4 Antipseudomonal penicillins

5.1.1.5 Mecillinams

5.1.2 Cephalosporins, carbapenems, and other beta-lactams

5.1.2.1 Cephalosporins

5.1.2.2 Carbapenems

5.1.2.3 Other beta-lactam antibiotics

5.1.3 Tetracyclines

5.1.4 Aminoglycosides

5.1.5 Macrolides

5.1.6 Clindamycin

5.1.7 Some other antibacterials

5.1.8 Sulfonamides and trimethoprim

5.1.9 Antituberculosis drugs

5.1.10 Antileprotic drugs

5.1.11 Metronidazole and tinidazole

5.1.12 Quinolones

5.1.13 Urinary-tract infections

5.2 Antifungal drugs

5.2.1 Triazole antifungals

5.2.2 Imidazole antifungals

5.2.3 Polyene antifungals

5.2.4 Echinocandin antifungals

5.2.5 Other antifungals

5.3 Antiviral drugs

5.3.1 HIV infection

5.3.2 Herpesvirus infections

5.3.2.1 Herpes simplex and varicella–zoster infection

5.3.2.2 Cytomegalovirus infection

5.3.3 Viral hepatitis

5.3.4 Influenza

5.3.5 Respiratory syncytial virus

5.4 Antiprotozoal drugs

5.4.1 Antimalarials

5.4.2 Amoebicides

5.4.3 Trichomonacides

5.4.4 Antigiardial drugs

5.4.5 Leishmaniacides

5.4.6 Trypanocides

5.4.7 Drugs for toxoplasmosis

5.4.8 Drugs for pneumocystis pneumonia

5.5 Anthelmintics

5.5.1 Drugs for threadworms

5.5.2 Ascaricides

5.5.3 Drugs for tapeworm infections

5.5.4 Drugs for hookworms

5.5.5 Schistosomicides

5.5.6 Filaricides

5.5.7 Drugs for cutaneous larva migrans

5.5.8 Drugs for strongylodiasis

This chapter also includes advice on the drug management of the following:
- anthrax, p. 368
- Clostridium difficile infection, p. 322
- bacterial infections: table 1, summary of antibacterial treatment, p. 322
- bacterial infections: table 2, summary of antibacterial prophylaxis, p. 330
- Lyme disease, p. 336
- MRSA infections, p. 334
- oral infections, p. 321, p. 328, p. 373

Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

- Anthrax
- Botulism
- Brucellosis
- Cholera
- Diarrhoea (infectious bloody)
- Diphtheria
- Encephalitis, acute
- Food poisoning
- Haemolytic uraemic syndrome
- Haemorrhagic fever (viral)
- Hepatitis, viral
- Legionnaires’ disease
- Leprosy
- Malaria
- Measles
- Meningitis
- Meningococcal septicaemia
- Paratyphoid fever
- Plague
- Poliomyelitis, acute
- Rabies
- Rubella
- SARS
- Scarlet fever
- Smallpox
- Streptococcal disease (Group A, invasive)
- Tuberculosis
- Typhoid fever
- Typhus
- Whooping cough
- Yellow fever

Note: It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.
5.1 Antibacterial drugs

Choice of a suitable drug  Before selecting an antibacterial the clinician must first consider two factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e., whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin but sensitive to nitrofurantoin (can cause nausea), gentamicin (can be given only by injection and best avoided in pregnancy), tetracycline (causes dental discoloration) and trimethoprim (folate antagonist therefore theoretical teratogenic risk), and cefalexin. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin would be indicated for this patient.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and new information on side-effects. Duration of therapy depends on the microbiological, pharmacological, and toxicological properties.

Before starting therapy  The following precepts need to be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials may be used to treat secondary bacterial infection (e.g., bacterial pneumonia secondary to influenza);
- Samples should be taken for culture and sensitivity testing; ‘blind’ antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of prevalent organisms and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g., life-threatening sepsis);
- The dose of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called ‘standard’ dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g., an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The route of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g., because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- Duration of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections.

Oral bacterial infections  Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget’s disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spread of infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological...
investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or erythromycin) with metronidazole may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

See also Penicillins (section 5.1.1), Cephalosporins (section 5.1.2), Tetracyclines (section 5.1.3), Macrolides (section 5.1.5), Clindamycin (section 5.1.6), Metronidazole (section 5.1.11), Fusidic acid (section 13.10.1.2).

Superinfection In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. fungal infections or antibiotic-associated colitis (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

**Therapy** Suggested treatment is shown in table 1. When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds. Infections for which prophylaxis is useful are listed in table 2.

---

**Table 1. Summary of antibacterial therapy**

If treating a patient suspected of suffering from a notifiable disease, the consultant in communicable disease control should be informed (see p. 320)

### Gastro-intestinal system

**Gastro-enteritis**

Frequently self-limiting and may not be bacterial.

Antibacterial not usually indicated

**Campylobacter enteritis**

Frequently self-limiting; treat if immunocompromised or if severe infection.

- Clarithromycin
  - Alternative, ciprofloxacin

**Salmonella (non-typhoid)**

Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, the elderly, or children under 6 months of age).

- Ciprofloxacin or ceftaxime

**Shigellosis**

Antibacterial not indicated for mild cases.

- Ciprofloxacin or azithromycin
  - Alternatives if micro-organism sensitive, amoxicillin or trimethoprim

**Typhoid fever**

Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.

- Cefotaxime
  - Azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant organisms.
  - Alternative, ciprofloxacin

- Strains with decreased sensitivity to ciprofloxacin being isolated

**Clostridium difficile infection**

- Oral metronidazole
  - Suggested duration of treatment 10–14 days

  For third or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in patients intolerant of metronidazole, oral vancomycin

  - Suggested duration of treatment 10–14 days

  For infection not responding to vancomycin, or for life-threatening infection, or in patients with ileus, oral vancomycin + i/v metronidazole

  - Suggested duration of treatment 10–14 days

**Biliary-tract infection**

- Ciprofloxacin or gentamicin or a cephalosporin

---

1. Where clarithromycin is suggested azithromycin or erythromycin may be used
2. Where cefotaxime is suggested ceftriaxone may be used
Peritonitis
A cephalosporin + metronidazole or gentamicin + metronidazole or gentamicin + clindamycin or piperacillin with tazobactam alone

Peritonitis: peritoneal dialysis-associated
Vancomycin1 + ceftazidime added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth
Suggested duration of treatment 14 days or longer

Cardiovascular system

Endocarditis: initial 'blind' therapy
Flucloxacillin (or benzylpenicillin if symptoms less severe) + gentamicin
If cardiac prostheses present, or if penicillin-allergic, or if meticillin-resistant Staphylococcus aureus suspected, vancomycin + rifampicin + gentamicin

Endocarditis caused by staphylococci
Flucloxacillin
Add rifampicin for at least 2 weeks in prosthetic valve endocarditis.
Suggested duration of treatment at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)
If penicillin-allergic or if meticillin-resistant Staphylococcus aureus, vancomycin + rifampicin
Suggested duration of treatment at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)

Native-valve endocarditis caused by fully-sensitive streptococci (e.g. viridans streptococci)
Benzylpenicillin
Suggested duration of treatment 4 weeks
Alternatively if a large vegetation, intracardial abscess, or infected emboli are absent, benzylpenicillin + gentamicin
Suggested duration of treatment 2 weeks
If penicillin-allergic, vancomycin
Suggested duration of treatment 4 weeks

Native-valve endocarditis caused by less-sensitive streptococci
Benzylpenicillin + gentamicin
Suggested duration of treatment 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)
If aminoglycoside cannot be used and if streptococci moderately sensitive to penicillin, benzylpenicillin
Suggested duration of treatment 4 weeks
If penicillin-allergic or highly penicillin-resistant, vancomycin1 + gentamicin
Suggested duration of treatment 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)

Prosthetic valve endocarditis caused by streptococci
Benzylpenicillin + gentamicin
Suggested duration of treatment at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)
If penicillin-allergic or highly penicillin-resistant, vancomycin1 + gentamicin
Suggested duration of treatment at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)

Endocarditis caused by enterococci (e.g. Enterococcus faecalis)
Amoxicillin2 + gentamicin
If gentamicin-resistant, substitute gentamicin with streptomycin.
Suggested duration of treatment at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)
If penicillin-allergic or penicillin-resistant, vancomycin1 + gentamicin
If gentamicin-resistant, substitute gentamicin with streptomycin.
Suggested duration of treatment at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)

Endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species ('HACEK' micro-organisms)
Amoxicillin2 + low-dose gentamicin
Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
If amoxicillin-resistant, ceftriaxone + low-dose gentamicin
Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

1. Where vancomycin is suggested teicoplanin may be used
2. Where amoxicillin is suggested ampicillin may be used

Infections
Respiratory system

Haemophilus influenzae epiglottitis
Cefotaxime

If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol

Chronic bronchitis: acute exacerbations
Treat if increase in sputum purulence accompanied by an increase in sputum volume or increase in dyspnoea.

Amoxicillin or tetracycline
Some pneumococci and *Haemophilus influenzae* strains tetracycline-resistant; approx. 20% *H. influenzae* strains amoxicillin-resistant.

**Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients**

Alternative, clarithromycin

**Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients**

Pneumonia: low-severity community-acquired
Amoxicillin

Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
If atypical pathogens suspected, add clarithromycin.

**Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients**

Alternatives, doxycycline or clarithromycin

**Suggested duration of treatment 5 days (14–21 days for infections caused by staphylococci)**

Pneumonia: moderate-severity community-acquired
Amoxicillin + clarithromycin or doxycycline alone

If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.

**Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)**

Pneumonia: high-severity community-acquired
Co-amoxiclav + clarithromycin

If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.

**Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)**

Alternative, cefuroxime + clarithromycin or cefotaxime + clarithromycin

If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.

**Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)**

Pneumonia possibly caused by atypical pathogens
Clarithromycin

If high-severity Legionella infection, add rifampicin for the first few days.

**Suggested duration of treatment 14 days (usually 7–10 days for Legionella)**

Alternative if Legionella infection suspected, a quinolone
If high-severity Legionella infection, add clarithromycin or rifampicin for the first few days.

**Suggested duration of treatment usually 7–10 days**

Alternative for chlamydial or mycoplasma infections, doxycycline

**Suggested duration of treatment 14 days**

Pneumonia: hospital-acquired

*Early-onset infection* (less than 5 days after admission to hospital), co-amoxiclav or cefuroxime

If life-threatening infection, or if history of antibacterial treatment in the last 3 months, or if resistant microorganisms suspected, treat as for late-onset hospital-acquired pneumonia.

**Suggested duration of treatment 7 days**

*Late-onset infection* (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam) or a broad-spectrum cephalosporin (e.g. ceftazidime) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin)

If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.

For severe illness caused by *Pseudomonas aeruginosa*, consider adding an aminoglycoside.

**Suggested duration of treatment 7 days (longer if *Pseudomonas aeruginosa* confirmed)**

---

1. Where cefotaxime is suggested ceftriaxone may be used
2. Where amoxicillin is suggested ampicillin may be used
3. Where clarithromycin is suggested azithromycin or erythromycin may be used
4. Where vancomycin is suggested teicoplanin may be used
Central nervous system

Meningitis: initial empirical therapy

- Transfer patient to hospital urgently
- If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin (see p. 334 for dose) can be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin (see p. 334 for dose) can be given before the transfer. Cefotaxime (section 5.1.2) may be an alternative in penicillin allergy; chloramphenicol (section 5.1.7) may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- In hospital, consider adjunctive treatment with dexamethasone (particularly if pneumococcal meningitis suspected in adults; section 6.3.2), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery.

- In hospital, if aetiology unknown:
  - Adult and child 3 months–50 years, cefotaxime
    Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
    Suggested duration of treatment at least 10 days
  - Adult over 50 years, cefotaxime + amoxicillin
    Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
    Suggested duration of treatment at least 10 days

Meningitis caused by meningococci

Benzylenpicillin or cefotaxime

Suggested duration of treatment 7 days.

To eliminate nasopharyngeal carriage give rifampicin for 2 days (see Table 2, section 5.1)

If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol

Suggested duration of treatment 7 days.

To eliminate nasopharyngeal carriage give rifampicin for 2 days (see Table 2, section 5.1)

Meningitis caused by pneumococci

Cefotaxime

Consider adjunctive treatment with dexamethasone (section 6.3.2), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).

If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin.

If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin.

Suggested duration of antibacterial treatment 14 days

Meningitis caused by Haemophilus influenzae

Cefotaxime

Consider adjunctive treatment with dexamethasone (section 6.3.2), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.

Suggested duration of antibacterial treatment 10 days.

For H. influenzae type b give rifampicin for 4 days before hospital discharge (see Table 2, section 5.1)

If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol

Consider adjunctive treatment with dexamethasone (section 6.3.2), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.

Suggested duration of antibacterial treatment 10 days.

For H. influenzae type b give rifampicin for 4 days before hospital discharge (see Table 2, section 5.1)

Meningitis caused by Listeria

Amoxicillin + gentamicin

Suggested duration of treatment 21 days.

Consider stopping gentamicin after 7 days

If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole

Suggested duration of treatment 21 days

1. Where cefotaxime is suggested ceftriaxone may be used
2. Where amoxicillin is suggested ampicillin may be used
Urinary tract

Pyelonephritis: acute
A broad-spectrum cephalosporin or a quinolone
Suggested duration of treatment 10–14 days (longer treatment may be necessary in complicated pyelonephritis)

Prostatitis: acute
Ciprofloxacin or ofloxacin
Suggested duration of treatment 28 days
Alternative, trimethoprim
Suggested duration of treatment 28 days

Urinary-tract infection: ‘lower’
Trimethoprim or nitrofurantoin
Suggested duration of treatment 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women. See also section 5.1.13
Alternative, amoxicillin\(^1\) or oral cephalosporin
Suggested duration of treatment 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women. See also section 5.1.13

Genital system

Early syphilis (infection of less than 2 years)
Contact tracing recommended.
Benzathine benzylpenicillin [unlicensed]
Suggested duration of treatment single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)
Alternative, doxycycline or erythromycin
Suggested duration of treatment 14 days

Late latent syphilis (asymptomatic infection of more than 2 years)
Contact tracing recommended.
Benzathine benzylpenicillin [unlicensed]
Suggested duration of treatment once weekly for 2 weeks
Alternative, doxycycline
Suggested duration of treatment 28 days

Asymptomatic contacts of patients with infectious syphilis
Doxycycline
Suggested duration of treatment 14 days

Gonorrhoea: uncomplicated
Contact tracing recommended. Remember chlamydia. Choice of antibacterial depends on locality where infection acquired.
Cefixime
Suggested duration of treatment single-dose
Alternative if micro-organism sensitive, ciprofloxacin
Suggested duration of treatment single-dose
Pharyngeal infection, ceftriaxone
Suggested duration of treatment single-dose

Uncomplicated genital chlamydial infection, non-gonococcal urethritis and non-specific genital infection
Contact tracing recommended.
Azithromycin or doxycycline
Suggested duration of treatment azithromycin as a single dose or doxycycline for 7 days
Alternative, erythromycin
Suggested duration of treatment 14 days

Pelvic inflammatory disease
Contact tracing recommended.
Doxycycline + metronidazole + i/m ceftriaxone or ofloxacin + metronidazole
Suggested duration of treatment 14 days (use i/m ceftriaxone as a single dose).
In severely ill patients initial treatment with doxycycline + i/v ceftriaxone (as a single dose) + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days’ treatment

---
\(^1\) Where amoxicillin is suggested ampicillin may be used
**Bacterial vaginosis**

Oral metronidazole

*Suggested duration of treatment* 5–7 days (or high-dose metronidazole as a single dose)

Alternatively, topical metronidazole or topical clindamycin

*Suggested duration of treatment* 5 days with metronidazole or 7 days with clindamycin

**Septicaemia: community-acquired**

A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid) or a broad-spectrum cephalosporin (e.g. cefuroxime)

If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.

If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin.

If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem)

**Septicaemia: hospital-acquired**

A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid, cefuroxime, imipenem with cilastatin, or meropenem)

If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.

If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin

**Septicaemia related to vascular catheter**

Vancomycin

If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.

Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudomonas, or *Candida* species

**Meningococcal septicaemia**

If meningococcal disease suspected, a single dose of benzylpenicillin (see p. 334 for dose) can be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime (section 5.1.2) may be an alternative in penicillin allergy; chloramphenicol may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

Benzylpenicillin or cefotaxime

To eliminate nasopharyngeal carriage give rifampicin for 2 days (see Table 2, section 5.1)

If *history of immediate hypersensitivity reaction to penicillin or to cephalosporins*, chloramphenicol

To eliminate nasopharyngeal carriage give rifampicin for 2 days (see Table 2, section 5.1)

**Musculoskeletal system**

**Osteomyelitis**

Seek specialist advice if chronic infection or prostheses present.

Flucloxacillin

Consider adding fusidic acid or rifampicin for initial 2 weeks.

*Suggested duration of treatment* 6 weeks for acute infection

If *penicillin-allergic*, clindamycin

Consider adding fusidic acid or rifampicin for initial 2 weeks.

*Suggested duration of treatment* 6 weeks for acute infection

If meticillin-resistant *Staphylococcus aureus* suspected, vancomycin

Consider adding fusidic acid or rifampicin for initial 2 weeks.

*Suggested duration of treatment* 6 weeks for acute infection

**Septic arthritis**

Seek specialist advice if prostheses present.

Flucloxacillin

*Suggested duration of treatment* 4–6 weeks (longer if infection complicated)

If *penicillin-allergic*, clindamycin

*Suggested duration of treatment* 4–6 weeks (longer if infection complicated)

If meticillin-resistant *Staphylococcus aureus* suspected, vancomycin

*Suggested duration of treatment* 4–6 weeks (longer if infection complicated)

If *gonococcal arthritis or Gram-negative infection suspected*, cefotaxime

*Suggested duration of treatment* 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks)

---

1. Where vancomycin is suggested teicoplanin may be used
2. Where cefotaxime is suggested ceftriaxone may be used
5.1 Antibacterial drugs

**Eye**

**Purulent conjunctivitis**
Chloramphenicol eye-drops
See also section 11.3.1

**Ear, nose, and oropharynx**

**Pericoronitis**
Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.
- Metronidazole
  - *Suggested duration of treatment* 3 days or until symptoms resolve
- *Alternative*, amoxicillin
  - *Suggested duration of treatment* 3 days or until symptoms resolve

**Gingivitis: acute necrotising ulcerative**
Antibacterial required only if systemic features of infection.
- Metronidazole
  - *Suggested duration of treatment* 3 days or until symptoms resolve
- *Alternative*, amoxicillin
  - *Suggested duration of treatment* 3 days or until symptoms resolve

**Periapical or periodontal abscess**
Antibacterial required only in severe disease with cellulitis or if systemic features of infection.
- Amoxicillin
  - *Suggested duration of treatment* 5 days
- *Alternative*, metronidazole
  - *Suggested duration of treatment* 5 days

**Periodontitis**
Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.
- Metronidazole
- *Alternative*, doxycycline

**Throat infections**

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin
  - In severe infection, initial parenteral therapy with benzylpenicillin, then oral therapy with phenoxymethylpenicillin or amoxicillin¹. Avoid amoxicillin if possibility of glandular fever, see section 5.1.1.3.
  - *Suggested duration of treatment* 10 days
- *If penicillin-allergic*, clarithromycin²
  - *Suggested duration of treatment* 10 days

**Sinusitis**

Antibacterial should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).

- Amoxicillin¹ or doxycycline or clarithromycin²
  - *Suggested duration of treatment* 7 days.
  - Consider oral co-amoxiclav if no improvement after 48 hours.
  - In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime may be required

**Otitis externa**

Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.
For topical preparations see section 12.1.1.

- Flucloxacinilin
  - *If penicillin-allergic*, clarithromycin²
  - *If pseudomonas suspected*, ciprofloxacin (or an aminoglycoside)

---

¹ Where amoxicillin is suggested ampicillin may be used
² Where clarithromycin is suggested azithromycin or erythromycin may be used
Otitis media
Many infections caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media.

Amoxicillin¹
Consider co-amoxiclav if no improvement after 48 hours.

If penicillin-allergic, clarithromycin²

Suggested duration of treatment 5 days (longer if severely ill)

Skin
Impetigo: small areas of skin infected
Seek local microbiology advice before using topical treatment in hospital.

Topical fusidic acid

Suggested duration of treatment 7 days is usually adequate (max. 10 days)

Alternative if meticillin-resistant Staphylococcus aureus, topical mupirocin

Suggested duration of treatment 7 days is usually adequate (max. 10 days)

Impetigo: widespread infection

Oral flucloxacillin

If streptococci suspected in severe infection, add phenoxymethylpenicillin.

Suggested duration of treatment 7 days

If penicillin-allergic, oral clarithromycin²

Suggested duration of treatment 7 days

Erysipelas

Phenoxymethylpenicillin or benzylpenicillin

If staphylococci suspected, replace phenoxymethylpenicillin or benzylpenicillin with flucloxacillin.

Suggested duration of treatment at least 7 days

If penicillin-allergic, clindamycin or clarithromycin²

Suggested duration of treatment at least 7 days

Cellulitis: mild or moderate

Flucloxacillin

If streptococcal infection confirmed, replace flucloxacillin with phenoxymethylpenicillin or benzylpeni-
cillin.

If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials

If penicillin-allergic, clindamycin or clarithromycin²

If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials

Cellulitis: severe

Benzylpenicillin + flucloxacillin

If oral treatment required, replace benzylpenicillin with phenoxymethylpenicillin.

If streptococcal infection confirmed, discontinue flucloxacillin.

If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials

If penicillin-allergic, clindamycin or clarithromycin²

If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials

Animal and human bites
Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection), see under Tetanus Vaccines, section 14.4. Consider rabies prophylaxis (section 14.4) for bites from animals in endemic countries; assess risk of blood-borne viruses.

Co-amoxiclav

If penicillin-allergic, doxycycline + metronidazole

Acne
See section 13.6

¹ Where amoxicillin is suggested ampicillin may be used
² Where clarithromycin is suggested azithromycin or erythromycin may be used
Table 2. Summary of antibacterial prophylaxis

Prevention of recurrence of rheumatic fever
Phenoxymethylpenicillin 250 mg twice daily or sulfadiazine 1 g daily (500 mg daily for patients under 30 kg)

Prevention of secondary case of invasive group A streptococcal infection
Phenoxymethylpenicillin 250–500 mg every 6 hours for 10 days; CHILD under 1 year 62.5 mg every 6 hours, 1–5 years 125 mg every 6 hours, 6–12 years 250 mg every 6 hours
Patients who are penicillin allergic,
either erythromycin Adult and CHILD over 8 years, 250–500 mg every 6 hours for 10 days; CHILD under 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours
or azithromycin [unlicensed indication] 500 mg once daily for 5 days; CHILD over 6 months, 12 mg/kg (max. 500 mg) once daily

Prevention of secondary case of meningococcal meningitis
Rifampicin 600 mg every 12 hours for 2 days; CHILD 10 mg/kg (under 1 year, 5 mg/kg) every 12 hours for 2 days
or ciprofloxacin 500 mg as a single dose; CHILD [unlicensed] 2–5 years 125 mg; 5–12 years 250 mg
or i/v ceftriaxone [unlicensed indication] 250 mg as a single dose; CHILD under 12 years 125 mg

Prevention of secondary case of Haemophilus influenzae type b disease
Rifampicin 600 mg once daily for 4 days (regimen of choice for adults); CHILD 1–3 months 10 mg/kg once daily for 4 days, over 3 months 20 mg/kg once daily for 4 days (max. 600 mg daily)

Prevention of secondary case of diphtheria in non-immune patient
Erythromycin ⁵ 500 mg every 6 hours for 7 days; CHILD up to 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours
Treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment. For immunisation against diphtheria see section 14.4

Prevention of secondary case of pertussis in non-immune patient or partially immune patient
Erythromycin ³ Adult and CHILD over 8 years, 250–500 mg every 6 hours for 7 days; CHILD under 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease
Phenoxymethylpenicillin 500 mg every 12 hours; CHILD under 5 years 125 mg every 12 hours, 6–12 years 250 mg every 12 hours—if cover also needed for *H. influenzae* in CHILD give amoxicillin instead (under 5 years 125 mg every 12 hours, over 5 years 250 mg every 12 hours)
Note Antibiotic prophylaxis is not fully reliable; for vaccines in asplenia see p. 749

Prevention of gas-gangrene in high lower-limb amputations
Benzylenicillin 300–600 mg every 6 hours for 5 days or if penicillin-allergic metronidazole 400–500 mg every 8 hours

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive
Isoniazid 300 mg daily for 6 months; CHILD 5 mg/kg daily (max. 300 mg daily)
or isoniazid 300 mg daily + rifampicin 600 mg daily (450 mg if less than 50 kg) for 3 months; CHILD isoniazid 5 mg/kg daily (max. 300 mg daily) + rifampicin 10 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg)
or (if isoniazid-resistant tuberculosis in patients under 35 years) rifampicin 600 mg daily (450 mg if less than 50 kg) for 6 months; CHILD 10 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg)

Prevention of infection in gastro-intestinal procedures
Operations on stomach or oesophagus
Single dose of i/v gentamicin or i/v cefuroxime or i/v co-amoxiclav
Add i/v teicoplanin if high risk of meticillin-resistant *Staphylococcus aureus*

1. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency Laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.
2. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency Laboratory).
3. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used
4. For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control). See also section 5.1.9, for advice on immunocompromised patients and on prevention of tuberculosis.
5. Intravenous antibiotic prophylaxis should be given up to 30 minutes before the procedure.
6. Additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss.
7. Where teicoplanin is suggested vancomycin may be used.
Open biliary surgery

Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone

Add i/v teicoplanin if high risk of meticillin-resistant Staphylococcus aureus

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy

Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone

Add i/v teicoplanin if high risk of meticillin-resistant Staphylococcus aureus

Endoscopic retrograde cholangiopancreatography

Single dose of i/v gentamicin or oral or i/v ciprofloxacin

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin or i/v vancomycin

Percutaneous endoscopic gastrostomy or jejunostomy

Single dose of i/v co-amoxiclav or i/v cefuroxime

Use single dose of i/v teicoplanin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus

Prevention of infection in orthopaedic surgery

Joint replacement including hip and knee

Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin + i/v gentamicin

Closed fractures

Single dose of i/v cefuroxime or i/v flucloxacillin

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin

Open fractures

i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole (or i/v clindamycin alone if history of allergy to penicillins or to cephalosporins)

Add i/v teicoplanin if high risk of meticillin-resistant Staphylococcus aureus. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours); at first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins). At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin.

Prevention of infection in urological procedures

Transrectal prostate biopsy

Single dose of oral ciprofloxacin + oral metronidazole or i/v gentamicin + i/v metronidazole

Use single dose of i/v gentamicin + i/v metronidazole if high risk of meticillin-resistant Staphylococcus aureus

Transurethral resection of prostate

Single dose of oral ciprofloxacin or i/v gentamicin or i/v cefuroxime

Use single dose of i/v gentamicin if high risk of meticillin-resistant Staphylococcus aureus

Prevention of infection in obstetric and gynaecological surgery

Caesarean section

Single dose of i/v cefuroxime

Administer immediately after umbilical cord is clamped. Substitute i/v clindamycin if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin if high risk of meticillin-resistant Staphylococcus aureus

Hysterectomy

Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone

Use single dose of i/v gentamicin + i/v metronidazole or add i/v teicoplanin to other regimens if high risk of meticillin-resistant Staphylococcus aureus

Termination of pregnancy

Single dose of oral metronidazole

If genital chlamydial infection cannot be ruled out, give doxycycline (section 5.1.3) postoperatively

Prevention of infection in cardiology procedures

Cardiac pacemaker insertion

Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin or i/v teicoplanin + i/v gentamicin

Use single dose of i/v teicoplanin if high risk of meticillin-resistant Staphylococcus aureus

Prevention of infection in vascular surgery

Reconstructive arterial surgery of abdomen, pelvis or legs

Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin

Add i/v metronidazole for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v teicoplanin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus.
Prevention of endocarditis

NICE guidance
Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)

Antibacterial prophylaxis and chlorhexidine mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is not recommended for the prevention of endocarditis in patients undergoing procedures of the:
- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that is followed by infection in patients with indwelling intraperitoneal catheters.

Patients at risk of endocarditis should be:
- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Dermatological procedures
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

Joint prostheses and dental treatment

Joint prostheses and dental treatment
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Dermatological procedures
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

Joint prostheses and dental treatment
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

5.1.1 Penicillins

5.1.1.1 Benzylpenicillin and phenoxymethylpenicillin
5.1.1.2 Penicillinase-resistant penicillins
5.1.1.3 Broad-spectrum penicillins
5.1.1.4 Antipseudomonal penicillins
5.1.1.5 Mecillinams

The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

Hypersensitivity reactions
The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Indi-
Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

**Other side-effects** A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should not be given by intrathecal injection because they can cause encephalopathy which may be fatal.

Another problem relating to high doses of penicillin, or normal doses given to patients with renal failure, is the accumulation of electrolyte since most injectable penicillins contain either sodium or potassium. Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

**Benzylpenicillin and phenoxymethylpenicillin**

Benzylpenicillin sodium (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax (section 5.1.12), diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease (section 5.1.1.3). Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin is effective in the treatment of tetanus, metronidazole (section 5.1.11) is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gut is low; therefore it is best given by injection.

Benzathine benzylpenicillin (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

**Oral infections** Phenoxymethylpenicillin is effective for dentoalveolar abscess.

---

**BENZYLPCENILLIN SODIUM**

(Penicillin G)

**Indications** throat infections, otitis media, endocarditis, meningococcal disease, pneumonia, cellulitis (Table 1, section 5.1); anthrax; intrapartum prophylaxis against group B streptococcal infection; prophylaxis in limb amputation (Table 2, section 5.1); see also notes above

**Cautions** history of allergy; false-positive urinary glucose (if tested for reducing substances); interactions: Appendix 1 (penicillins)

**Contra-indications** penicillin hypersensitivity

**Renal impairment** reduce dose—consult product literature; high doses may cause cerebral irritation, convulsions, or coma

**Pregnancy** not known to be harmful

**Breast-feeding** trace amounts in milk

**Side-effects** hypersensitivity reactions including urticaria, fever, joint pains, rashes, angioedema, anaphylaxis, serum sickness-like reaction; rarely CNS toxicity including convulsions (especially with high doses or in severe renal impairment), interstitial nephritis, haemolytic anaemia, leucopenia, thrombocytopenia, and coagulation disorders; also reported diarrhoea (including antibiotic-associated colitis)

**Dose**

- By intramuscular or by slow intravenous injection or by infusion, 0.6–1.2 g every 6 hours, increased if necessary in more serious infections (single doses over 1.2 g intravenous route only; see also below); NEONATE under 7 days, 25 mg/kg every 12 hours, dose doubled in severe infection; NEONATE 7–28 days, 25 mg/kg every 8 hours, dose doubled in severe infection; CHILD 1 month–18 years, 25 mg/kg every 6 hours (increased in severe infection to 50 mg/kg every 4–6 hours (max. 2.4 g every 4 hours); intravenous route recommended in neonates and infants
- Endocarditis (in combination with another antibiotic if necessary, see Table 1, section 5.1.1), by slow intravenous injection or by infusion, 1.2 g every 4 hours, increased if necessary (e.g. in enterococcal endocarditis or if benzylpenicillin used alone) to 2.4 g every 4 hours; CHILD 1 month–18 years see BNF for Children
- Anthrax (in combination with other antibiotics, see also section 5.1.12), by slow intravenous injection or by infusion, 2.4 g every 4 hours; CHILD 37.5 mg/kg every 6 hours
5.1.1 Penicillins

- Intrapartum prophylaxis against group B streptococcal infection, by slow intravenous injection or by infusion, initially 3 g then 1.5 g every 4 hours until delivery
- Meningitis, meningococcal disease, by slow intravenous injection or by infusion, 2.4 g every 4 hours;
- **NEONATE**, 75 mg/kg every 8 hours;  **CHILD** 1 month–18 years, 50 mg/kg every 4–6 hours (max. 2.4 g every 4 hours)

**Important.** If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) is suspected, a single dose of benzylpenicillin can be given before transferring the patient to hospital urgently, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, a single dose of benzylpenicillin can be given before the transfer. Suitable doses of benzylpenicillin by intravenous injection (or by intramuscular injection) are:
- **ADULT** 1.2 g, **INFANT** under 1 year 300 mg;  **CHILD** 1–9 years 600 mg, 10 years and over as for adults.
- In **penicillin allergy**, cefotaxime (section 5.1.2) may be an alternative; chloramphenicol (section 5.1.7) may be used if there is a history of anaphylaxis to penicillin

**By intrathecal injection, not recommended**

**Note** Benzylpenicillin doses in BNF may differ from those in product literature

**Crystapen** (Genus) \[\text{TM}\]

**Injection**, powder for reconstitution, benzylpenicillin sodium (unbuffered), net price 600-mg vial = £9.5p, 2-vial ‘GP pack’ = £2.64; 1.2-g vial = £1.89

**Electrolytes** Na\(^+\) 1.68 mmol/600-mg vial; 3.36 mmol/1.2-g vial

**PHENOXYMETHYLPENICILLIN** (Penicillin V)

**Indications**
oral infections (see notes above); tonsillitis, otitis media, erysipelas, cellulitis; group A streptococcal infection, rheumatic fever and pneumococcal infection prophylaxis (Table 2, section 5.1)

**Caution** see under Benzylpenicillin; **Interactions:** Appendix 1 (penicillins)

**Contra-indications** see under Benzylpenicillin

**Pregnancy** not known to be harmful

**Breast-feeding** trace amounts in milk

**Side-effects** see under Benzylpenicillin

**Dose**
- 500 mg every 6 hours increased up to 1 g every 6 hours in severe infections; **CHILD** up to 1 year 62.5 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours in severe infections; 1–6 years, 125 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours in severe infections; 6–12 years, 250 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours in severe infections

**Note** Phenoxymercaptilcin doses in the BNF may differ from those in product literature

**Phenoxymercaptilcin** (Non-proprietary) \[\text{TM}\]

**Tablets**, phenoxymercaptilcin (as potassium salt) 250 mg, net price 28-tab pack = £1.27. Label: 9, 23

**Dental prescribing on NHS** Phenoxymercaptilcin Tablets may be prescribed

**Oral solution**, phenoxymercaptilcin (as potassium salt) for reconstitution with water, net price 125 mg/5 mL, 100 mL = £1.90; 250 mg/5 mL, 100 mL = £2.59. Label: 9, 23

**Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

**Dental prescribing on NHS** Phenoxymercaptilcin Oral Solution may be prescribed

---

5.1.1.2 Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinas. **Fluclaxillin**, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Fluclaxillin is acid-stable and can, therefore, be given by mouth as well as by injection.

Fluclaxillin is well absorbed from the gut. For a warning on hepatic disorders see under Fluclaxillin.

**Temocillin** is active against Gram-negative bacteria and is stable against a wide range of beta-lactamas. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against **Pseudomonas aeruginosa** or **Acinetobacter spp**.

**MRSA** Infection from **Staphylococcus aureus** strains resistant to meticillin [now discontinued] (meticillin-resistant **Staph. aureus**, MRSA) and to fluclaxillin can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

**Rifampicin** (section 5.1.9) or **sodium fusidate** (section 5.1.7) should not be used alone because resistance may develop rapidly. A **tetracycline** alone or a combination of rifampicin and sodium fusidate can be used for skin and soft-tissue infections caused by MRSA; **clindamycin** alone is an alternative. A **glycopeptide** (e.g. vancomycin, section 5.1.7) can be used for severe skin and soft-tissue infections associated with MRSA, if a glycopeptide is unsuitable, **linezolid** (section 5.1.7) can be used on expert advice. As linezolid is not active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and sodium fusidate or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

**Tigecycline** (section 5.1.3) and **daptomycin** (section 5.1.7) are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A **tetracycline** or **clindamycin** can be used for **bronchectasis** caused by MRSA. A **glycopeptide** can be used for **pneumonia** associated with MRSA; if a glycopeptide is unsuitable, **linezolid** can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms.

A **tetracycline** can be used for urinary-tract infections caused by MRSA; **trimethoprim** or **nitrofurantoin** are alternatives. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for **septicaemia** associated with MRSA.

For the management of **endocarditis, osteomyelitis, or septic arthritis** associated with MRSA, see Table 1, section 5.1.

Prophylaxis with vancomycin or teicoplanin (alone or in combination with another antibacterial active against
other pathogens) is appropriate for patients undergoing surgery if:
- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

For eradication of nasal carriage of MRSA, see section 12.2.3.

**FLUCLOXACILLIN**

**Indications** infections due to beta-lactamase-producing staphylococci including otitis externa; adjunct in pneumonia, impetigo, cellulitis, osteomyelitis and in staphylococcal endocarditis (Table 1, section 5.1)

**Cautions** see under Benzylpenicillin (section 5.1.1.1); risk of kermicterus in jaundiced neonates when high doses given parenterally; interactions: Appendix 1 (penicillins)

**Hepatic disorders** Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:
- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

**Contra-indications** see under Benzylpenicillin (section 5.1.1.1)

**Hepatic impairment** see Cautions and Hepatic Disorders above

**Renal impairment** reduce dose if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** not known to be harmful

**Breast-feeding** trace amounts in milk

**Side-effects** see under Benzylpenicillin (section 5.1.1.1); also gastro-intestinal disturbances; very rarely hepatitis and cholestatic jaundice (see also Hepatic disorders above)

**Dose**
- **By mouth**, 250–500 mg every 6 hours, at least 30 minutes before food; **NEONATE** see BNF for Children; **CHILD** 1 month–2 years, 62.5–125 mg every 6 hours, at least 30 minutes before food; 2–10 years, 125–250 mg every 6 hours, at least 30 minutes before food
- **By intramuscular injection**, 250–500 mg every 6 hours; **CHILD** 1 month–18 years see BNF for Children
- **By slow intravenous injection or by intravenous infusion**, 0.25–2 g every 6 hours; **CHILD** under 18 years see BNF for Children

Endocarditis (in combination with another antibiotic, see Table 1, section 5.1), body-weight under 85 kg, 8 g daily in 4 divided doses; body-weight over 85 kg, 12 g daily in 6 divided doses; **CHILD** 1 month–18 years see BNF for Children

Osteomyelitis (see Table 1, section 5.1), up to 8 g daily in 3–4 divided doses; **CHILD** under 18 years see BNF for Children

Surgical prophylaxis, by slow intravenous injection or by intravenous infusion, 1–2 g up to 30 minutes before the procedure; up to 4 further doses of 500 mg may be given every 6 hours by mouth, or by intramuscular injection, or by slow intravenous injection or by intravenous infusion for high risk procedures

**Note** Flucloxacillin doses in BNF may differ from those in product literature

**Flucloxacillin** (Non-proprietary) \*FN\*

**Capsules**, flucloxacillin (as sodium salt) 250 mg, net price 28 = £2.07; 500 mg, 28 = £3.21. Label: 9, 23

**Brands** include Floxapen\*c, Floxomic\*c, Lodrophen\*c

**Oral solution** (= elixir or syrup), flucloxacillin (as sodium salt) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £4.41; 250 mg/5 mL, 100 mL = £31.28. Label: 9, 23

**Brands** include Lodrophen\*c

Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

**Injection**, powder for reconstitution, flucloxacillin (as sodium salt), net price 250-mg vial = £1.23; 500-mg vial = £2.45; 1-g vial = £4.90

**TEMOCILLIN**

**Indications** septicaemia, urinary-tract infections, lower respiratory-tract infections caused by susceptible Gram-negative bacteria

**Cautions** see under Benzylpenicillin (section 5.1.1.1); interactions: Appendix 1 (penicillins)

**Contra-indications** see under Benzylpenicillin (section 5.1.1.1)

**Renal impairment** 1 g every 12 hours if eGFR 20–60 mL/minute/1.73 m²; 1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²; 1 g every 48 hours or 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** not known to be harmful

**Breast-feeding** trace amounts in milk

**Side-effects** see under Benzylpenicillin (section 5.1.1.1)

**Dose**
- **ADULT** over 18 years, by intramuscular injection or by intravenous injection over 3–4 minutes, or by intravenous infusion, 1–2 g every 12 hours

**Negabam** (Eumedica) \*FN\*

**Injection**, powder for reconstitution, temocillin (as sodium salt), net price 1-g vial = £25.45

**Electrolytes** Na⁺ 5 mmol/L

**5.1.1.3 Broad-spectrum penicillins**

Ampicillin is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the ‘blind’ treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections (section 5.1.13).
Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut. Maculopapular rashes commonly occur with ampicillin (and amoxicillin) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Amoxicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease [not licensed], see below.

Co-amoxiclav consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of Staph. aureus, E. coli, and H. influenzae, as well as many Bacteroides and Klebsiella spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of amoxicillin with fluclouxacin (as co-fluampicil) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis). Fluampicil) is available to treat infections involving staphylococci (e.g. cellulitis).

**Indications** see under Ampicillin; also oral infections, Lyme disease (see notes above); endocarditis treatment (Table 1, section 5.1); anthrax (section 5.1.12); adjunct in laterial meningitis (Table 1, section 5.1); Helicobacter pylori eradication (section 1.3).

**Cautions** see under Ampicillin; maintain adequate hydration with high doses (particularly during parenteral therapy); interactions: Appendix 1 (penicillins).

**Contra-indications** see under Ampicillin

**Renal impairment** risk of crystalluria with high doses (particularly during parenteral therapy). Reduce dose in severe impairment; rashes more common

**Pregnancy** not known to be harmful

**Breast-feeding** trace amounts in milk

**Side-effects** see under Ampicillin

**Dose**

- **By mouth, ADULT** and **CHILD** over 5 years, 250 mg every 8 hours, dose doubled in severe infection; **CHILD**, 1 month–1 year, 62.5 mg every 8 hours, dose doubled in severe infection; 1–5 years, 125 mg every 8 hours, dose doubled in severe infection

- **Otitis media, 500 mg every 8 hours; CHILD 40 mg/kg daily** in 3 divided doses (max. 1.5 g daily)

- **Pneumonia, ADULT** over 18 years, 0.5–1 g every 8 hours

- **Lyme disease** (see also notes above), **ADULT** and **CHILD** over 5 years, 500 mg every 8 hours for 14–21 days [for 28 days in Lyme arthritis] (unlicensed indication).

- **CHILD** 1 month–5 years see BNF for Children

- **Anthrax** (treatment and post-exposure prophylaxis—see also section 5.1.12), 500 mg every 8 hours; **CHILD body-weight under 20 kg, 80 mg/kg daily** in 3 divided doses, body-weight over 20 kg, adult dose

- **Short-course oral therapy**

  - **Dental abscess, ADULT** over 18 years, 3 g repeated after 8 hours

  - **Urinary-tract infections, ADULT** over 18 years, 3 g repeated after 10–12 hours

  - **By intramuscular injection, ADULT** over 18 years, 500 mg every 8 hours

  - **By intravenous injection, ADULT** over 18 years, 500 mg every 8 hours increased to 1 g every 6 hours in severe infection

  - **CHILD** 1 month–18 years, 20–30 mg/kg (max. 500 mg) every 8 hours; dose doubled in severe infection (max. 4 g daily)

- **Listerial meningitis** (in combination with another antibiotic, see Table 1, section 5.1), **by intravenous infusion, ADULT** over 18 years, 2 g every 4 hours for 10–14 days; **CHILD** under 18 years see BNF for Children

- **Endocarditis** (in combination with another antibiotic if necessary, see Table 1, section 5.1), **by intravenous infusion, ADULT** over 18 years, 2 g every 6 hours, increased to 2 g every 4 hours e.g. in enterococcal endocarditis or if amoxicillin used alone; **CHILD** under 18 years see BNF for Children

**Note** Amoxicillin doses in BNF may differ from those in product literature.

**Amoxicillin (Non-proprietary)†**

**Capsules** amoxicillin (as trihydrate) 250 mg, net price 21 = £1.07; 500 mg, 21 = £1.31. Label: 9

**Brands** include Amix®, Amoram®, Amoxident®, Galenamox®, Rimoxallin®

**Dental prescribing on NHS** Amoxicillin Capsules may be prescribed

**Oral suspension** amoxicillin (as trihydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.22; 250 mg/5 mL, 100 mL = £1.39.

**Label:** 9

**Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

**Brands** include Amoram®, Galenamox®, Rimoxallin®

**Dental prescribing on NHS** Amoxicillin Oral Suspension may be prescribed.
**Sachets**, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, net price 2-sachet pack = £8.34, 14-sachet pack = £31.94. Label: 9, 13

**Dental prescribing on NHS** Amoxicillin Sachets may be prescribed as Amoxicillin Oral Powder

**Injection** powder for reconstitution, amoxicillin (as sodium salt), net price 250-mg vial = 52p; 500-mg vial = 66p; 1-g vial = £1.16

**Amoxil** (GSK)  \( \text{Capsules, both maroon/gold, amoxicillin (as trihydrate), 250 mg, net price 21-cap pack = £3.45; 500 mg, 21-cap pack = £6.91. Label: 9} \)

**Paediatric suspension**, amoxicillin 125 mg (as trihydrate)/1.25 mL when reconstituted with water, net price 20 mL (peach- strawberry- and lemon-flavoured) = £2.25. Label: 9, counselling, use of pipette

**Sachets 5F** powder, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, 2-sachet pack (peach- strawberry- and lemon-flavoured) = £2.99. Label: 9, 13

**Injection** powder for reconstitution, amoxicillin (as sodium salt), net price 500-mg vial = 56p; 1-g vial = £1.12

**Electrolytes** Na+ 3.3 mmol/L

---

**AMPICILLIN**

**Indications** urinary-tract infections, otitis media, sinusitis, oral infections (see notes above), bronchitis, low or moderate-severity community-acquired pneumonia (Table 1, section 5.1), invasive salmonellosis; listerial meningitis (Table 1, section 5.1)

**Cautions** history of allergy; erythematous rashes common in glandular fever (see notes above); increased risk of erythematous rashes in cytomegalovirus infection, and acute or chronic lymphocytic leukaemia (see notes above); **interactions**: Appendix 1 (penicillins)

**Contra-indications** penicillin hypersensitivity

**Renal impairment** reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common

**Pregnancy** not known to be harmful

**Breast-feeding** trace amounts in milk

**Side-effects** nausea, vomiting, diarrhoea; rashes (discontinue treatment); rarely, antibiotic-associated colitis; see also under Benzylpenicillin (section 5.1.1.1)

**Dose**

- By mouth, 0.25–1 g every 6 hours, **CHILD** 1 month–1 year, 62.5 mg every 6 hours, dose doubled in severe infection; 1–5 years, 125 mg every 6 hours, dose doubled in severe infection; 5–12 years, 250 mg every 6 hours, dose doubled in severe infection
- Urinary-tract infections, **ADULT** and **CHILD** over 10 years, 500 mg every 8 hours; **CHILD** under 10 years, half adult dose
- By intramuscular injection or intravenous injection or infusion, 500 mg every 4–6 hours; **CHILD** under 18 years see BNF for Children
- Endocarditis (in combination with another antibiotic if necessary, see Table 1, section 5.1), by intravenous infusion, **ADULT** over 18 years, 2 g every 6 hours, increased to 2 g every 4 hours e.g. in enterococcal endocarditis or if ampicillin used alone; **CHILD** under 18 years see BNF for Children
- Listerial meningitis (in combination with another antibiotic, see Table 1, section 5.1), by intravenous infusion, **ADULT** over 18 years, 2 g every 4 hours for 10–14 days; **CHILD** under 18 years see BNF for Children

**Note** Amoxicillin doses in BNF may differ from those in product literature

**Ampicillin (Non-proprietary)**

**Capsules**, amoxicillin 250 mg, net price 28-cap pack = £7.18; 500 mg, 28-cap pack = £32.93. Label: 9, 23

**Brands include Rimaciclav**

**Dental prescribing on NHS** Ampicillin Capsules may be prescribed

**Oral suspension**, amoxicillin 125 mg/5 mL when reconstituted with water, net price 100 mL = £9.23; 250 mg/5 mL, 100 mL = £14.17. Label: 9, 23

**Brands include Rimaciclav**

**Dental prescribing on NHS** Ampicillin Oral Suspension may be prescribed

**Injection**, powder for reconstitution, amoxicillin (as sodium salt), net price 500-mg vial = £7.83

**Penbritin** (Chemidex)

**Capsules**, grey/red, amoxicillin (as trihydrate) 250 mg, net price 28-cap pack = £2.10; 500 mg, 28-cap pack = £5.28. Label: 9, 23

**Syrup**, apricot- caramel- and peppermint-flavoured, amoxicillin (as trihydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £3.78; 250 mg/5 mL, 100 mL = £7.39. Label: 9, 23

**Excipients** include sucrose 3.6 g/5 mL

**With fluoxacillin** See Co-fluampicil

---

**CO-AMOXICLAV**

A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form \( x/y \) where \( x \) and \( y \) are the strengths in milligrams of amoxicillin and clavulanic acid respectively

**Indications** infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites, severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial

**Cautions** see under Ampicillin and notes above; maintain adequate hydration with high doses (particularly during parenteral therapy); **interactions**: Appendix 1 (penicillins)

**Cholestatic jaundice** Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days

**Contra-indications** penicillin hypersensitivity, history of co-amoxiclav-associated or penicillin-associated jaundice or hepatic dysfunction

**Hepatic impairment** monitor liver function in liver disease; see also Cholestatic Jaundice above

**Renal impairment** risk of crystalluria with high doses (particularly during parenteral therapy).

**Co-amoxiclav 250/125 tablets or 500/125 tablets**: if eGFR 10–30 mL/minute/1.73 m², one 250/125 strength tablet every 12 hours or one 500/125 strength tablet every 12 hours; if eGFR less than
Infections (Non-proprietary)  

By mouth. Dose see under Ampicillin; hepatitis, cholestatic jaundice (see above); Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, vasculitis reported; rarely prolongation of bleeding time, dizziness, headache, convulsions (particularly with high doses or in renal impairment); superficial staining of teeth with suspension, phlebitis at injection site.

Dose  
- By mouth, expressed as co-amoxiclav, one 250/125 strength tablet every 8 hours, increased in severe infections to one 500/125 strength tablet every 8 hours; NEONATE 0.25 mL/kg of 125/31 suspension every 8 hours; CHILD 1 month–1 year, 0.25 mL/kg of 125/31 suspension every 8 hours, dose doubled in severe infection; 1–6 years, 5 mL of 125/31 suspension every 8 hours or 0.25 mL/kg of 125/31 suspension every 8 hours, dose doubled in severe infection; 6–12 years, 5 mL of 250/62 suspension every 8 hours or 0.15 mL/kg of 250/62 suspension every 8 hours, dose doubled in severe infection. Severe dental infections (but not generally first-line, see notes above), expressed as co-amoxiclav, ADULT and CHILD over 12 years, one 250/125 strength tablet every 8 hours for 5 days.
- By intravenous injection over 3–4 minutes or by intravenous infusion, expressed as co-amoxiclav, 1.2 g every 8 hours; INFANTS up to 3 months 30 mg/kg every 8 hours (every 12 hours in the perinatal period and in premature infants); CHILD 3 months–18 years, 30 mg/kg (max. 1.2 g) every 8 hours. Surgical prophylaxis, expressed as co-amoxiclav, 1.2 g up to 30 minutes before the procedure; for high risk procedures up to 2–3 further doses of 1.2 g may be given every 8 hours.

Co-amoxiclav (Non-proprietary)  
Tablets, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £2.63. Label: 9
Dental prescribing on NHS Co-amoxiclav 250/125 Tablets may be prescribed
Tablets, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £4.38. Label: 9
Oral suspension, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £6.29. Label: 9
Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription
Dental prescribing on NHS Co-amoxiclav 125/31 Suspension may be prescribed
Oral suspension, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £6.29. Label: 9
Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription
Dental prescribing on NHS Co-amoxiclav 250/62 Suspension may be prescribed

CO-FLUAMPCIL  
A mixture of equal parts by mass of flucloxacillin and ampicillin.

Indications mixed infections involving beta-lactamase-producing staphylococci.

Cautions see under Ampicillin and Flucloxacillin; interactions: Appendix 1 (penicillins).

Contra-indications see under Ampicillin and Flucloxacillin.

Hepatic impairment see under Flucloxacillin.

Twice daily oral preparations  
Co-amoxiclav (Non-proprietary)  
Suspension 400/57, co-amoxiclav 400/57 (amoxicillin 400 mg as trihydrate, clavulanic acid 57 mg as potassium salt)/5 mL when reconstituted with water, net price 35 mL = £4.13, 70 mL = £5.79. Label: 9
Excipients may be aspartame (section 9.4.1)
Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription
Brands include Augmentin-Duo.
Dose CHILD 2 months–2 years 0.15 mL/kg twice daily, 2–6 years (13–21 kg) 2.5 mL twice daily, 7–12 years (22–40 kg) 5 mL twice daily, dosage in severe infections.

Infections

Co-amoxiclav injection (expressed as co-amoxiclav): if eGFR 10–30 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 24 hours.
Pregnancy not known to be harmful.

Breast-feeding trace amounts in milk.

Side-effects see under Ampicillin; hepatitis, cholestatic jaundice (see above); Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, vasculitis reported; rarely prolongation of bleeding time, dizziness, headache, convulsions (particularly with high doses or in renal impairment); superficial staining of teeth with suspension, phlebitis at injection site.

Electrolytes Na⁺ 1.35 mmol/L, K⁺ 0.5 mmol/L/400 mg vial
Injection 1.2 g, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt), net price per vial = £2.61
Electrolytes Na⁺ 2.7 mmol/L, K⁺ 1 mmol/L/1.2 g vial

Injection 500/100, powder for reconstitution, co-amoxiclav 500/100 (amoxicillin 500 mg as sodium salt, clavulanic acid 100 mg as potassium salt), net price per vial = £1.21

Injection 1000/200, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt), net price per vial = £2.63

Augmentin® (GSK)  
Tablets 375 mg, f/c, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £4.19. Label: 9
Tablets 625 mg, f/c, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £8.00. Label: 9
Suspension ‘125/31 SF’, sugar-free, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL (raspberry-and orange-flavoured) = £4.08. Label: 9
Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)
Suspension ‘250/62 SF’, sugar-free, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL (raspberry-and orange-flavoured) = £5.74. Label: 9
Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Co-amoxiclav 250/62 Suspension may be prescribed

Dose CHILD 2 months–2 years 0.15 mL/kg twice daily, 2–6 years (13–21 kg) 2.5 mL twice daily, 7–12 years (22–40 kg) 5 mL twice daily, dosage in severe infections.

BNF 61
Renal impairment see under Ampicillin and Flucloxacillin

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk

Side-effects see under Ampicillin and Flucloxacillin

Dose
- **By mouth**, co-fluamicil, 250/250 every 6 hours, dose doubled in severe infections; **CHILD** under 10 years half adult dose, dose doubled in severe infections
- **By intramuscular or slow intravenous injection** or by **intravenous infusion**, co-fluamicil 250/250 every 6 hours, dose doubled in severe infections; **CHILD** under 2 years quarter adult dose, 2–10 years half adult dose, dose doubled in severe infections

Co-fluamicil (Non-proprietary) (Non-proprietary)

Capsules, co-fluamicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as trihydrate), net price 28-cap pack = £14.73. Label: 9, 22
Brands include Flu-Amp®

Syrup, co-fluamicil 125/125 (flucloxacillin 125 mg as magnesium salt, ampicillin 125 mg as trihydrate)/5 mL when reconstituted with water, net price 100 mL = £6.99. Label: 9, 22

Magnapen® (Wockhardt) (Non-proprietary)

Injection 500 mg, powder for reconstitution, co-fluamicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as sodium salt), net price per vial = £1.33
Electrolytes Na⁺ 1.3 mmol/vial

5.1.1.4 Antipseudomonal penicillins

Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam.

Ticarcillin, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid (section 5.1.1.3). Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, peritonitis, hospital-acquired pneumonia, complicated urinary-tract infections, and skin and soft-tissue infections.

For severe pseudomonas infections (especially in neutropenia or endocarditis) these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin section 5.1.1.4) since they have a synergistic effect. Owing to the sodium content of many of these antimicrobials, it is important to reduce dose to 20 mL/minute/1.73 m² in patients with mild renal impairment.

**TICARCELLIN WITH CLAVULANIC ACID**

**Indications** infections due to *Pseudomonas* and *Proteus* spp, see notes above

**Cautions** see under Benzylpenicillin (section 5.1.1.1); interactions: Appendix 1 (penicillins)

**Chelexis jaundice** For a warning on chelexis jaundice possibly associated with clavulanic acid, see under Co-amoxyclav, p. 337

**Contra-indications** see under Benzylpenicillin (section 5.1.1.1)

**Hepatic impairment** manufacturer advises caution in severe impairment; also chelexis jaundice, see under Co-amoxyclav, p. 337

**Renal impairment** reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** not known to be harmful
5.1.2 Cephalosporins, carbapenems, and other beta-lactams

Antibiotics in this section include the cephalosporins, such as cefotaxime, cefazidime, cefuroxime, ceferidine, and cefadroxil, the monobactam, aztreonam, and the carbapenems, imipenem (a thienamycin derivative), meropenem, doripenem, and ertapenem.

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excepting being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime is a suitable cephalosporin for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin should not receive a cephalosporin. If a cephalosporin is essential in these patients because a suitable alternative antibacterial is not available, then cefixime, cefotaxime, ceftazidime, ceftriaxone, or cefuroxime can be used with caution; cefaclor, cefadroxil, ceftaxime, and cefradine should be avoided. Antibiotic-associated colitis may occur with the use of broad-spectrum cephalosporins, particularly second- and third-generation cephalosporins.

Cefuroxime is a ‘second generation’ cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamasases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against Haemophilus influenzae.

Cefotaxime, ceftazidime, and ceftriaxone are ‘third generation’ cephalosporins with greater activity than the ‘second generation’ cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably Staphylococcus aureus. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Cefadroxil has good activity against pseudomonas. It is also active against other Gram-negative bacteria. Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Orally active cephalosporins The orally active ‘first generation’ cephalosporins, cefalexin, ceftaroline, and cefadroxil, and the ‘second generation’ cephalosporin, cefaclor, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy,
respiratory-tract infections, otitis media, sinovitis, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*, but it is associated with protracted skin reactions especially in children. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. Cefuroxime axetil, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound: it is poorly absorbed.

Cefixime and cefpodoxime proxetil are orally active 'third generation' cephalosporins. Cefixime has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections. Cefpodoxime proxetil is more active than the other oral cephalosporins against respiratory bacterial pathogens and it is licensed for upper and lower respiratory-tract infections.

For treatment of Lyme disease, see section 5.1.1.3.

**Oral infections** The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin and cefradine have been used in the treatment of oral infections.

### CEFACLOR

**Indications** infections due to sensitive Gram-positive and Gram-negative bacteria, but see notes above

**Cautions** sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction; see also notes above and p. 322); false positive urinary glucose (if tested for reducing substances) and false positive Coombs' test; **interactions:** Appendix 1 (cephalosporins)

**Contra-indications** cephalosporin hypersensitivity

**Renal impairment** no dose adjustment required—manufacturer advises caution

**Pregnancy** not known to be harmful

**Breast-feeding** present in milk in low concentration, but appropriate to use

**Side-effects** diarrhoea (rarely antibiotic-associated colitis), nausea and vomiting, abdominal discomfort, headache; allergic reactions including rashes, pruritus, urticaria, serum sickness-like reactions with rashes, fever and arthralgia, and anaphylaxis; Stevens-Johnson syndrome, toxic epidermal necrolysis reported; disturbances in liver enzymes, transient hepatitis and cholestatic jaundice; other side-effects reported include eosinophilia and blood disorders (including thrombocytopenia, leucopenia, agranulocytosis, aplastic anaemia and haemolytic anaemia); reversible interstitial nephritis, hyperactivity, nervousness, sleep disturbances, hallucinations, confusion, hyperventilation, and dizziness

**Dose**

- 250 mg every 8 hours, doubled for severe infections; max. 4 g daily; **CHILD** over 1 month, 20 mg/kg daily in 3 divided doses, doubled for severe infections, max. 1 g daily; or 1 month–1 year, 62.5 mg every 8 hours; 1–5 years, 125 mg; over 5 years, 250 mg; doses doubled for severe infections

### CEFADROXIL

**Indications** see under Cefaclor; see also notes above

**Cautions** see under Cefaclor; **interactions:** Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Renal impairment** 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m²; 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m²; 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m²

**Pregnancy** see under Cefaclor

**Breast-feeding** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**

- 0.5–1 g twice daily; skin, soft-tissue, and uncomplicated urinary-tract infections, 1 g daily; **CHILD** 6–18 years, body-weight under 40 kg, 500 mg twice daily; body-weight over 40 kg, adult dose

**Cefadroxil** (Non-proprietary) Capsules, cefadroxil (as monohydrate) 500 mg, net price 20-cap pack = £4.82. Label: 9

### CEFALEXIN

(Cephalexin)

**Indications** see under Cefaclor

**Cautions** see under Cefaclor; **interactions:** Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Renal impairment** max. 3 g daily if eGFR 40–50 mL/minute/1.73 m²; max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m²; max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** see under Cefaclor

**Breast-feeding** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**

- 250 mg every 6 hours or 500 mg every 8–12 hours increased to 1–1.5 g every 6–8 hours for severe
Infections; CHILD 25 mg/kg daily in divided doses, doubled for severe infections, max. 100 mg/kg daily; or under 1 year 125 mg every 12 hours, 1–5 years 125 mg every 8 hours, 5–12 years 250 mg every 8 hours

- Prophylaxis of recurrent urinary-tract infection, ADULT 125 mg at night

**Cefalexin** (Non-proprietary) (Sanofi-Aventis)

Capsules, cefalexin 250 mg, net price 28-cap pack = £1.66; 500 mg, 21-cap pack = £2.09. Label: 9

**Dental prescribing on NHS** Cefalexin Capsules may be prescribed

Tablets, cefalexin 250 mg, net price 28-cap pack = £1.94; 500 mg, 21-cap pack = £2.39. Label: 9

**Dental prescribing on NHS** Cefalexin Tablets may be prescribed

**Oral suspension**, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.75; 250 mg/5 mL, 100 mL = £2.15. Label: 9

**Dental prescribing on NHS** Cefalexin Oral Suspension may be prescribed

**Ceporex** (Co-Pharma) (Sanofi-Aventis)

Capsules, both caramel/grey, cefalexin 250 mg, net price 28-cap pack = £4.02; 500 mg, 28-cap pack = £7.85. Label: 9

Tablets, all pink, f/c, cefalexin 250 mg, net price 28-tab pack = £4.02; 500 mg, 28-tab pack = £7.85. Label: 9

**Syrup**, all orange, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.43; 250 mg/5 mL, 100 mL = £2.87; 500 mg/5 mL, 100 mL = £5.57. Label: 9

**Kellex** (Flynn) (Sanofi-Aventis)

Capsules, cefalexin 250 mg (green/white), net price 28-cap pack = £1.46; 500 mg (pale green/dark green), 21-cap pack = £1.98. Label: 9

Tablets, both peach, cefalexin 250 mg, net price 28-tab pack = £1.60; 500 mg (scored), 21-tab pack = £2.08. Label: 9

**Suspension**, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.40; 250 mg/5 mL, 100 mL = £2.87; 500 mg/5 mL, 100 mL = £5.57. Label: 9

**CEFOTAXIME**

**Indications** see under Cefaclor; gonorrhoea; surgical prophylaxis; Haemophilus epiglottitis and meningitis (Table 1, section 5.1); see also notes above

**Cautions** see under Cefaclor; interactions: Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Renal impairment** if eGFR less than 5 mL/minute/1.73 m², initial dose of 1 g then use half normal dose

**Pregnancy** see under Cefaclor

**Breast-feeding** see under Cefaclor

**Side-effects** see under Cefaclor; rarely arrhythmias following rapid injection reported

**Dose**

- By intramuscular or intravenous injection or by intravenous infusion, 1 g every 12 hours increased in severe infections (e.g. meningitis) to 8 g daily in 4 divided doses; higher doses (up to 12 g daily in 3–4 divided doses) may be required; NEOANTE 50 mg/kg daily in 2–4 divided doses increased to 150–200 mg/kg daily in severe infections, CHILD 100–150 mg/kg daily in 2–4 divided doses increased up to 200 mg/kg daily in very severe infections

Uncomplicated gonorrhoea, 500 mg as a single dose

**Important** If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) is suspected, and the patient cannot be given benzylpenicillin (e.g. because of an allergy), a single dose of cefotaxime can be given (if available) before urgent transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently and cannot be given benzylpenicillin, a single dose of cefotaxime can be given before transfer. Suitable doses of cefotaxime by intravenous injection (or by intramuscular injection) are ADULT and CHILD over 12 years 1 g; CHILD under 12 years 50 mg/kg; chloramphenicol (section 5.1.7) may be used if there is a history of anaphylaxis to penicillins or cephalosporins

**Cefotaxime** (Non-proprietary)

**Injection**, powder for reconstitution, cefotaxime (as sodium salt), net price 500-mg vial = £2.14; 1-g vial = £4.31; 2-g vial = £8.57

**CEFPODOXIME**

**Indications** see under Dose

**Cautions** see under Cefaclor; interactions: Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Renal impairment** increase dose interval to every 24 hours if eGFR 10–40 mL/minute/1.73 m²; increase dose interval to every 48 hours if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** see under Cefaclor

**Breast-feeding** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**

- Upper respiratory-tract infections (but in pharyngitis and tonsillitis reserved for infections which are recurrent, chronic, or resistant to other antibacterials), 100 mg twice daily (200 mg twice daily in sinusitis); CHILD 15 days–6 months 4 mg/kg every 12 hours, 6
months—2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours

- Lower respiratory tract infections (including bronchitis and pneumonia), 100–200 mg twice daily; CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours

- Skin and soft-tissue infections, 200 mg twice daily; CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours

- Uncomplicated urinary-tract infections, 100 mg twice daily (200 mg twice daily in uncomplicated upper urinary-tract infections); CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours

- Breast-feeding see under Cefaclor

- Pregnancy see under Cefaclor; see also notes above

- Hepatic impairment reduce dose and monitor plasma concentration if both hepatic and severe renal impairment

- Renal impairment reduce dose if eGFR less than 50 mL/minute/1.73 m²—consult product literature

- Pregnancy see under Cefaclor

- Breast-feeding see under Cefaclor

- Dose

  - By deep intramuscular injection or intravenous injection or infusion, 1 g every 8 hours or 2 g every 12 hours; 2 g every 6–12 hours or 3 g every 12 hours in severe infections; single doses over 1 g intravenous

route only; ELDERLY usual max. 3 g daily; CHILD, up to 2 months 25–60 mg/kg daily in 2 divided doses, over 2 months 30–100 mg/kg daily in 2–3 divided doses; up to 150 mg/kg daily (max. 6 g daily) in 3 divided doses if immunocompromised or meningitis; intravenous route recommended for children

Urinary-tract and less serious infections, 0.5–1 g every 12 hours

Pseudomonal lung infection in cystic fibrosis, ADULT 100–150 mg/kg daily in 3 divided doses; CHILD up to 150 mg/kg daily (max. 6 g daily) in 3 divided doses; intravenous route recommended for children

Surgical prophylaxis, prostatic surgery, 1 g up to 30 minutes before the procedure, repeated if necessary when catheter removed

Ceftazidime (Non-proprietary) \(^\text{A} \)

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 1-g vial = £8.50; 2-g vial = £17.90

Fortum\(^\text{®} \) (GSK) \(^\text{A} \)

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 250-mg vial = £2.20, 500-mg vial = £4.40, 1-g vial = £8.79, 2-g vial = £17.59, 3-g vial = £25.76, Monovial, 2 g vial (with transfer needle) = £17.59

Electrolytes Na⁺ 2.3 mmol/g

Kefadim\(^\text{®} \) (Flynn) \(^\text{A} \)

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 1-g vial = £7.92; 2-g vial = £15.84

Electrolytes Na⁺ 2.3 mmol/g

CEFTRIAXONE

Indications see under Cefaclor and notes above; surgical prophylaxis; prophylaxis of meningococcal meningitis [unlicensed indication] (Table 2, section 5.1)

Cautions see under Cefaclor, may displace bilirubin from serum albumin, administer over 60 minutes in neonates (see also Contra-indications); treatment longer than 14 days, renal failure, dehydration—risk of ceftriaxone precipitation in gall bladder; interactions: Appendix 1 (cephalosporins)

Contra-indications see under Cefaclor; neonates less than 41 weeks postmenstrual age; neonates over 41 weeks postmenstrual age with jaundice, hypoalbuminaemia, or acidosis; concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in neonates over 41 weeks postmenstrual age—risk of precipitation in urine and lungs

Hepatic impairment reduce dose and monitor plasma concentration if both hepatic and severe renal impairment

Renal impairment reduce dose if eGFR less than 10 mL/minute/1.73 m² (max. 2 g daily); monitor plasma concentration if both hepatic and severe renal impairment

Pregnancy see under Cefaclor

Breast-feeding see under Cefaclor

Side-effects see under Cefaclor; calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised) or in gall bladder—consider discontinuation if symptomatic; rarely prolongation of prothrombin time, pancreatitis
5.1.2 Cephalosporins, carbapenems, and other beta-lactams

**Dose**
- By deep intramuscular injection, or by intravenous injection over at least 2–4 minutes, or by intravenous infusion, 1 g daily; 2–4 g daily in severe infections; intramuscular doses over 1 g divided between more than one site; single intravenous doses above 1 g by intravenous infusion only
- **NEONATE**, by intravenous infusion over 60 minutes, 20–50 mg/kg daily (max. 50 mg/kg daily); **INFANT** and **CHILD** under 50 kg, by deep intramuscular injection, or by intravenous injection over 2–4 minutes, or by intravenous infusion, 20–50 mg/kg daily; up to 80 mg/kg daily in severe infections; doses of 50 mg/kg and over by intravenous infusion only; 50 kg and over, adult dose
- Endocarditis caused byhaemophilus, actinobacillus, cardio-bacterium, eikenella, and kingella species (‘HACEK organisms’) (in combination with another antibacterial, see Table 1, section 5.1; [unlicensed indication]), by intravenous infusion, 2–4 g daily
- Early syphilis [unlicensed indication], by deep intramuscular injection, 500 mg daily for 10 days
- Uncomplicated gonorrhoea, pelvic inflammatory disease (see also Table 1, section 5.1) by deep intramuscular injection, 250 mg as a single dose
- Surgical prophylaxis, by deep intramuscular injection or by intravenous injection over at least 2–4 minutes, 1 g up to 30 minutes before the procedure; colorectal surgery, by deep intramuscular injection or by intravenous infusion, 2 g up to 30 minutes before the procedure; intramuscular doses over 1 g divided between more than one site

**Ceftriaxone (Non-proprietary)**
- **Injection**, powder for reconstitution, ceftriaxone (as sodium salt), net price 1-g vial = £10.17; 2-g vial = £20.36

**Rocephin® (Roche)**
- **Injection**, powder for reconstitution, ceftriaxone (as sodium salt), net price 250-mg vial = £4.56; 1.5-g vial = £5.05

**Cefuroxime (Non-proprietary)**
- **Tablets**, cefuroxime (as axetil) 250 mg, net price 14-tab pack = £10.39. Label: 9, 21, 25
- **Injection**, powder for reconstitution, cefuroxime (as sodium salt), net price 750-mg vial = £2.52; 1.5-g vial = £5.05

**Zinacef® (GSK)**
- **Injection**, powder for reconstitution, cefuroxime (as sodium salt), net price 250-mg vial = 94p; 750-mg vial = £2.34; 1.5-g vial = £4.70
- **Electrolytes** Na⁺ 1.8 mmol/750-mg vial

**Zinnat® (GSK)**
- **Tablets**, both f/c, cefuroxime (as axetil) 125 mg, net price 14-tab pack = £4.56; 250 mg, 14-tab pack = £9.11. Label: 9, 21, 25
- **Suspension**, cefuroxime (as axetil) 125 mg/5 mL when reconstituted with water, net price 70 mL (tutti-frutti-flavoured) = £5.20. Label: 9, 21
- **Exipients** include aspartame (section 9.4.1), sucrose 3.1 g/5 mL

**CEFUROXIME**

**Indications** see under Cefaclor; surgical prophylaxis; more active against *Haemophilus influenzae*, Lyme disease

**Cautions** see under Cefaclor; **interactions**: Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Renal impairment** use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m²; use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** see under Cefaclor

**Breast-feeding** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**
- By mouth (as cefuroxime axetil), 250 mg twice daily in most infections including mild to moderate lower respiratory-tract infections (e.g. bronchitis); doubled for more severe lower respiratory-tract infections or if pneumonia suspected
- Urinary-tract infection, 125 mg twice daily, doubled in pyelonephritis
- **CHILD** over 3 months, 125 mg twice daily, if necessary doubled in child over 2 years with otitis media

**Lyme disease** (see also section 5.1.1.3), **ADULT** and **CHILD** over 12 years, 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis) [unlicensed duration]
- By intramuscular injection or intravenous injection or infusion, 750 mg every 6–8 hours; 1.5 g every 6–8 hours in severe infections; single doses over 750 mg intravenous route only
- **CHILD** usual dose 60 mg/kg daily (range 30–100 mg/kg daily) in 3–4 divided doses (2–3 divided doses in neonates)
- Surgical prophylaxis, 1.5 g by intravenous injection up to 30 minutes before the procedure; up to 3 further doses of 750 mg may be given by intravenous or intramuscular injection every 8 hours for high-risk procedures

**Cefuroxime (Non-proprietary)**
- **Tablets**, cefuroxime (as axetil) 250 mg, net price 14-tab pack = £10.39. Label: 9, 21, 25
- **Injection**, powder for reconstitution, cefuroxime (as sodium salt), net price 750-mg vial = £2.52; 1.5-g vial = £5.05
- **Zinacef® (GSK)**
- **Injection**, powder for reconstitution, cefuroxime (as sodium salt), net price 250-mg vial = 94p; 750-mg vial = £2.34; 1.5-g vial = £4.70
- **Electrolytes** Na⁺ 1.8 mmol/750-mg vial

**Zinnat® (GSK)**
- **Tablets**, both f/c, cefuroxime (as axetil) 125 mg, net price 14-tab pack = £4.56; 250 mg, 14-tab pack = £9.11. Label: 9, 21, 25
- **Suspension**, cefuroxime (as axetil) 125 mg/5 mL when reconstituted with water, net price 70 mL (tutti-frutti-flavoured) = £5.20. Label: 9, 21
- **Exipients** include aspartame (section 9.4.1), sucrose 3.1 g/5 mL

5.1.2.2 Carbapenems

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; imipenem, meropenem, and doripenem have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against meticillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including sepsicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections. Doripenem is an alternative for hospital-acquired pneumonia, complicated intra-abdominal infections, and complicated urinary-tract infections.

**Ertapenem** is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter* spp.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with cilastatin, a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem, doripenem,
and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics; neurotoxicity has been observed at very high dosage, in renal failure, or in patients with CNS disease. Ertapenem has been associated with seizures uncommonly. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

**DORIPENEM**

**Indications** hospital-acquired pneumonia; complicated intra-abdominal infections; complicated urinary-tract infections

**Cautions** sensitivity to beta-lactam antibiotics (avoid if history of immediate hypersensitivity reaction, see also p. 332); interactions: Appendix 1 (doripenem)

**Renal impairment** 250 mg every 8 hours if eGFR 30–50 mL/minute/1.73 m²; 250 mg every 12 hours if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies

**Side-effects** nausea, diarrhoea; headache; phlebitis, pruritus, rash; less commonly antibiotic-associated colitis, thrombocytopenia, neutropenia; also reported, toxic epidermal necrolysis, and Stevens-Johnson syndrome

**Dose**

- By intravenous infusion, **ADULT** over 18 years, 500 mg every 8 hours; max. duration of treatment 14 days
- **Doribax** (Janssen-Cilag) By intravenous infusion, powder for reconstitution, doripenem (as monohydrate), net price 500-mg vial = £14.52

**IMIPENEM WITH CILASTATIN**

**Indications** aerobic and anaerobic Gram-positive and Gram-negative infections; surgical prophylaxis; hospital-acquired septicemia (Table 1, section 5.1); not indicated for CNS infections

**Cautions** sensitivity to beta-lactam antibiotics (avoid if history of immediate hypersensitivity reaction, see also p. 332); CNS disorders (e.g. epilepsy); interactions: Appendix 1 (imipenem with cilastatin)

**Renal impairment** risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m²—consult product literature

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies)

**Breast-feeding** present in milk but unlikely to be absorbed (however, manufacturer advises avoid)

**Side-effects** nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), taste disturbances, tooth or tongue discoloration, hearing loss; blood disorders, positive Coombs’ test; allergic reactions (with rash, pruritus, urticaria, Stevens-Johnson syndrome, fever, anaphylactic reactions, rarely toxic epidermal necrolysis, exfoliative dermatitis); myoclonic activity, convulsions, confusion and mental disturbances reported; slight increases in liver enzymes and bilirubin reported, rarely hepatitis; increases in serum creatinine and blood urea; red coloration of urine in children reported; local reactions: erythema, pain and induration, and thrombophlebitis

**Dose**

- By intravenous infusion, **ADULT** and **ADOLESCENT** over 13 years, 1 g once daily; **CHILD** 3 months–13 years, 15 mg/kg every 12 hours (max. 1 g daily)
- Surgical prophylaxis, colorectal surgery, **ADULT** over 18 years, 1 g completed within 1 hour before surgery

**Invanz® (MSD) Intravenous infusion**, powder for reconstitution, ertapenem (as sodium salt), net price 1-g vial = £31.65 Electrolytes *N* +6 mmol/1-g vial

---

**BNF 61**

**5.1.2 Cephalosporins, carbapenems, and other beta-lactams**

---
### MEROPENEM

**Indications**
- aerobics and anaerobics Gram-positive and Gram-negative infections (see notes above); hospital-acquired septicaemia (Table 1, section 5.1)

**Cautions**
- sensitivity to beta-lactam antibiotics (avoid if history of immediate hypersensitivity reaction, see also p. 332); interactions: Appendix 1 (meropenem)

**Hepatic impairment**
- monitor liver function

**Renal impairment**
- use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m²; use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m²; use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy**
- manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding**
- unlikely to be absorbed (however, manufacturer advises avoid unless potential benefit justifies potential risk)

**Side-effects**
- nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), abdominal pain, disturbances in liver function tests, headache, thrombocytopenia, rash, pruritus; less commonly paraesthesia, eosinophilia, thrombocytopenia, leucopenia; rarely convulsions; also reported haemolytic anaemia, positive Coombs’ test, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**
- **By intravenous injection** over 5 minutes or by intravenous infusion, 0.5–1 g every 8 hours; **CHILD 3 months–12 years** 10–20 mg/kg every 8 hours, body-weight over 50 kg, adult dose
- **Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis, meningitis, by intravenous infusion**, 2 g every 8 hours; **CHILD 3 months–12 years** 40 mg/kg every 8 hours, body-weight over 50 kg, adult dose

**Meropenem® (AstraZeneca)**

- **Injection**, powder for reconstitution, meropenem (as trihydrate), net price 500-mg vial = £8.60; 1-g vial = £17.19
- **Electrolytes Na+ 3.9 mmol/g**

### 5.1.3 Tetracyclines

**BNF 61**

**Cautions**
- hypersensitivity to beta-lactam antibiotics; interactions: Appendix 1 (aztreonam)

**Specific cautions for inhaled treatment**
- Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose

**Contra-indications**
- aztreonam hypersensitivity

**Hepatic impairment**
- use injection with caution and monitor liver function

**Renal impairment**
- if eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose; if eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose

**Pregnancy**
- no information available; manufacturer of injection advises avoid; manufacturer of powder for nebuliser solution advises avoid unless essential

**Breast-feeding**
- amount in milk probably too small to be harmful

**Side-effects**
- **Specific side-effects for parenteral treatment**
  - Nausea, vomiting, diarrhoea, abdominal cramps, mouth ulcers, altered taste, jaundice and hepatitis, flushing; hypersensitivity reactions; blood disorders (including thrombocytopenia and neutropenia); rashes, injection-site reactions; rarely hypotension, seizures, asthma, confusion, dizziness, headache, halitosis, and breast tenderness; very rarely antibiotic-associated colitis, gastro-intestinal bleeding, and toxic epidermal necrolysis

- **Specific side-effects for inhaled treatment**
  - Wheezing, bronchospasm, cough; pyrexia; rash; rhinorrhoea, pharyngolaryngeal pain

**Dose**
- **By deep intramuscular injection or by intravenous injection** over 3–5 minutes or by intravenous infusion, 1 g every 8 hours or 2 g every 12 hours; 2 g every 6–8 hours for severe infections (including systemic *Pseudomonas aeruginosa* and lung infections in cystic fibrosis); single doses over 1 g intravenous route only
- **Urinary-tract infections**, 0.5–1 g every 8–12 hours
- **CHILD over 1 week, by intravenous injection or infusion**, 30 mg/kg every 6–8 hours increased in severe infections for child of 2 years or older to 50 mg/kg every 6–8 hours; max. 8 g daily
- **Gonorrhoea, cystitis, by intramuscular injection**, 1 g as a single dose
- **Chronic pulmonary Pseudomonas aeruginosa infection in patients with cystic fibrosis**, by inhalation of nebulised solution, ADULT over 18 years, 75 mg 3 times daily (at least 4 hours apart) for 28 days; if additional courses required, a minimum of 28 days after aztreonam nebuliser solution recommended between courses

#### Parenteral

**Azactam® (Squibb)**

- **Injection**, powder for reconstitution, azactam, net price 1-g vial = £9.40; 2-g vial = £18.82

#### Inhalation

**Cayston® (Gilead)**

- **Powder for nebuliser solution**, aztreonam (as lysine), net price 84 × 75 mg vials (with solvent and nebuliser handset) = £2566.50

### 5.1.3 Tetracyclines

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice...
for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline with either streptomycin or rifampicin), and the spirochaete, Borrelia burgdorferi (Lyme disease—see section 5.1.1.3). They are also used in respiratory and genital mycoplasma infections; in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against Haemophilus influenzae), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin).

For the role of tetracyclines in the management of meticillin-resistant Staphylococcus aureus (MRSA) infection, see p. 334. Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline which has a broader spectrum; it is active against Neisseria meningitidis and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo (see section 5.1, table 2 for current recommendations). Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

**Oral infections** In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline has a longer duration of action than tetracycline or oxytetracycline and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

For the use of doxycycline in the treatment of recurrent aphthous ulceration, oral herpes, or as an adjunct to gingival scaling and root planing for periodontitis, see section 12.3.1 and section 12.3.2.

**Cautions** Tetracyclines may increase muscle weakness in patients with myasthenia gravis, and exacerbate systemic lupus erythematosus. Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines; milk also reduces the absorption of demeclocycline, oxytetracycline, and tetracycline. Other interactions: Appendix 1 (tetracyclines).

**Contra-indications** Deposition of tetracyclines in teeth may cause discoloration and occasionally dental hypoplasia, and they should not be given to children under 12 years, or to pregnant or breast-feeding women. However, doxycycline may be used in children for treatment and post-exposure prophylaxis of anthrax when an alternative antibacterial cannot be given [unlicensed indication]. Tetracyclines should not be given to patients with acne in the infant is probably usually prevented by chelation with calcium in milk).

**Side-effects** Side-effects of the tetracyclines include nausea, vomiting, diarrhea (antibiotic-associated colitis reported occasionally), dysphagia, and oesophageal irritation. Other rare side-effects include hepatotoxicity, pancreatitis, blood disorders, photosensitivity (particularly with demeclocycline), and hypersensitivity reactions (including rash, exfoliative dermatitis, Stevens-Johnson syndrome, urticaria, angiodema, anaphylaxis, pericarditis). Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment); bulging fontanelles have been reported in infants.

### TETRACYCLINE

**Indications** see notes above; acne vulgaris, rosacea (section 13.6)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above; max. 1 g daily in divided doses

**Renal impairment** see notes above

**Pregnancy** Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester of pregnancy in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parenteral doses.

**Breast-feeding** Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

**Dose**

- 250 mg every 6 hours, increased in severe infections to 500 mg every 6–8 hours
- Acne, see section 13.6.2
- Non-gonococcal urethritis, 500 mg every 6 hours for 7–14 days (21 days if failure or relapse after first course)

**Counselling** Tablets should be swallowed whole with plenty of fluid while sitting or standing

### DEMECLOCYCLINE HYDROCHLORIDE

**Indications** see notes above; also inappropriate secretion of antidiuretic hormone, section 6.5.2

**Cautions** see notes above, but photosensitivity more common (avoid exposure to sunlight or sun lamps)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Dental prescribing on NHS** Tetracycline Tablets may be prescribed

**Renal impairment** see notes above
DOXYCYCLINE

**Indications**  see notes above; chronic prostatitis; sinusitis, syphilis, pelvic inflammatory disease (Table 1, section 5.1); treatment and prophylaxis of anthrax [unlicensed indication]; malaria treatment and prophylaxis (section 5.4.1); recurrent aphthous ulceration, adjunct to gingival scaling and root planing for periodontitis (section 12.3.1); oral herpes simplex (section 12.3.2); rosacea, acne vulgaris (section 13.6)

**Cautions**  see notes above; alcohol dependence; photosensitivity reported (avoid exposure to sunlight or sun lamps)

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  use with caution (avoid excessive doses)

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see notes above; also anorexia, dry mouth, flushing, anxiety, and tinnitus

**Dose**
- 200 mg on first day, then 100 mg daily; severe infections (including refractory urinary-tract infections), 200 mg daily
- Early syphilis, 100 mg twice daily for 14 days; late latent syphilis, 100 mg twice daily for 28 days; neurosyphilis, 200 mg twice daily for 28 days
- Uncomplicated genital chlamydia, non-gonococcal urethritis, 100 mg twice daily for 7 days (14 days in pelvic inflammatory disease, see also Table 1, section 5.1)
- Lyme disease (see also section 5.1.1.3), 100 mg twice daily for 10–14 days (28 days in Lyme arthritis)
- Anthrax (treatment or post-exposure prophylaxis; see also section 5.1.12), 100 mg twice daily; CHILD (only if alternative antibacterial cannot be given) [unlicensed dose] 5 mg/kg daily in 2 divided doses (max. 200 mg daily)

**Counselling** Capsules should be swallowed whole with plenty of fluid during meals while sitting or standing

**Note** Doxycycline doses in BNF may differ from those in product literature

**Doxycycline** (Non-proprietary)

**Capsules**, doxycycline (as hyclate) 50 mg, net price 28-cap pack = £1.16. Label: 6, 9, 11, 23

**Dental prescribing on NHS** Doxycycline Capsules 100 mg may be prescribed

**Vibramycin-D®** (Pfizer)

**Dispersible tablets**, yellow, scored, doxycycline 100 mg, net price 8-tab pack = £4.91. Label: 6, 9, 11, 13

**Dental prescribing on NHS** May be prescribed as Dispersible Doxycycline Tablets

**Modified-release**

**Efacec®** (Galderma) Capsules, m/r, beige, doxycycline (as monohydrate) 40 mg, net price 56-cap pack = £29.78. Label: 6, 11, 27, counselling, posture

**Dose** papulosquamous, facial rosacea (without ocular involvement), 40 mg daily in the morning for 16 weeks; consider discontinuing treatment if no response after 6 weeks

**LYMECTYLNE**

**Indications**  see notes above

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  see notes above

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see notes above

**Dose**
- 408 mg every 12 hours, increased to 1.224–1.632 g daily in severe infections
- Acne, 408 mg daily for at least 8 weeks

**Tetralysal 300®** (Galderma) Capsules, red/yellow, lymecycline 408 mg (= tetracycline 300 mg), net price 28-cap pack = £7.77, 56-cap pack = £14.97. Label: 6, 9

**MINOCYCLINE**

**Indications**  see notes above; meningococcal carrier state; acne vulgaris (section 13.6.2)

**Cautions**  see notes above; if treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  use with caution (avoid excessive doses)

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see notes above; also dizziness and vertigo (more common in women); rarely anorexia, tinnitus, impaired hearing, hyperaesthesia, paraesthesia, acute renal failure, pigmentation (sometimes irreversible), and alopecia; very rarely systemic lupus erythematosus, discoloration of conjunctiva, tears, and sweat

**Dose**
- 100 mg twice daily
- Acne, see section 13.6.2 and under preparations, below
- Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended, see notes above), 100 mg twice daily for 5 days usually followed by rifampicin

**Counselling** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing

**Minocycline** (Non-proprietary)

**Capsules**, minocycline (as hydrochloride) 50 mg, net price 56-cap pack = £15.27. 100 mg, 28-cap pack = £13.09. Label: 6, 9, counselling, posture

**Brands include** Akneum®
Tigecycline

Tigecycline is a glycyclcline antibacterial structurally related to the tetracyclines; side-effects similar to those of the tetracyclines can potentially occur. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant Staphylococcus aureus and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus* spp are resistant to tigecycline. Tigecycline should be reserved for the treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms; however, it is not recommended for the treatment of foot infections in patients with diabetes.

**TIGECYCLINE**

**Indications** complicated intra-abdominal infections; complicated skin and soft-tissue infections, but not diabetic foot infections

**Cautions** cholestasis; interactions: Appendix 1 (tigecycline)

**Contra-indications** hypersensitivity to tetracyclines

** Hepatic impairment** initially 100 mg then 25 mg every 12 hours in severe impairment

** Pregnancy** see under Tetracyclines, p. 347

** Breast-feeding** manufacturer advises caution—present in milk in animal studies

** Side-effects** see notes above; also nausea, vomiting, abdominal pain, dyspepsia, diarrhoea, anorexia, bilirubinaemia, dizziness, headache, prolonged prothrombin time, prolonged activated partial thromboplastin time, rash, pruritus, and injection-site reactions; less commonly pancreatitis, cholestatic jaundice, and hypoproteinaemia; also reported, anti-biotic-associated colitis, hepatic failure, and thrombocytopenia

**Dose**

- **By intravenous infusion, Adult**: over 18 years, initially 100 mg, then 50 mg every 12 hours for 5–14 days

**Tygacil®** (Wyeth) v/t

*Intravenous infusion,* powder for reconstitution, tigecycline, net price 50-mg vial = £32.31

5.1.4 Aminoglycosides

These include amikacin, gentamicin, neomycin, streptomycin, and tobramycin. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*, streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis (section 5.1.9).

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Most side-effects of this group of antibiotics are dose-related therefore care must be taken with dosage and whenever possible treatment should not exceed 7 days. The important side-effects are ototoxicity, and nephrotoxicity; they occur most commonly in the elderly and in patients with renal failure.

Aminoglycosides may impair neuromuscular transmission and should not be given to patients with myasthenia gravis; large doses given during surgery have been responsible for a transient myasthenic syndrome and should not be given to patients with myasthenia gravis; large doses given during surgery have been responsible for a transient myasthenic syndrome in patients with normal neuromuscular function.

Aminoglycosides should preferably not be given with potentially ototoxic diuretics (e.g. furosemide); if concurrent use is unavoidable administration of the aminoglycoside and of the diuretic should be separated by as long a period as practicable.

**Renal impairment** Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Ototoxicity and nephrotoxicity occur commonly in patients with renal failure. If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Serum-aminoglycoside concentrations must be monitored in patients with renal impairment, see Serum Concentrations below; renal, auditory, and vestibular function should also be monitored. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.

**Once daily dosage** *Once daily administration* of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded *multiple daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted.

A once-daily, high-dose regimen of an aminoglycoside
should be avoided in patients with endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 ml/minute.

**Serum concentrations** Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen; patients with renal impairment may require earlier and more frequent measurement of aminoglycoside concentration.

For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration (‘peak’ concentration) and also just before the next dose (‘trough’ concentration). If the pre-dose (‘trough’) concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.

Serum-aminoglycoside concentrations should be measured in all patients and must be determined in infants, in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

**Endocarditis** Gentamicin is used in combination with other antibiotics for the treatment of bacterial endocarditis (Table 1, section 5.1). Serum-gentamicin concentration should be determined twice each week (more often in renal impairment). Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis (see above and Table 1, section 5.1).

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzymatic inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin may be administered by nebuliser on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

**Pregnancy** There is a risk of auditory or vestibular nerve damage when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin (section 5.1.9). The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential (if given, serum-aminoglycoside concentration monitoring is essential).

### GENTAMICIN

**Indications** septicaemia and neonatal sepsis; meningitis and other CNS infections; biliary-tract infection, acute pyelonephritis or prostatitis, endocarditis (see notes above); pneumonia in hospital patients, adjunct in listerial meningitis (Table 1, section 5.1); eye (section 11.3.1); ear (section 12.1.1)

**Cautions** neonates, infants and elderly (adjust dose and monitor renal, auditory and vestibular function together with serum gentamicin concentrations); avoid prolonged use; conditions characterised by muscular weakness; see also notes above; interactions: Appendix 1 (aminoglycosides)

**Contra-indications** myasthenia gravis

**Renal impairment** see notes above

**Pregnancy** see notes above

**Side-effects** vestibular and auditory damage, nephrotoxicity; rarely, hypomagnesaemia on prolonged therapy, antibiotic-associated colitis, stomatitis; also reported, nausea, vomiting, rash, blood disorders; see also notes above

**Dose**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely.

- Multiple daily dose regimen, by intramuscular or by slow intravenous injection over at least 3 minutes or by intravenous infusion, 3–5 mg/kg daily (in divided doses every 8 hours), see also notes above; **CHILD under 18 years see BNF for Children**

Endocarditis (in combination with other antibiotics, see Table 1, section 5.1), **ADULT 1 mg/kg every 8 hours; CHILD under 18 years see BNF for Children**

- Once daily dose regimen (see notes above and also consult local guidelines), by intravenous infusion, initially 5–7 mg/kg, then adjust according to serum-gentamicin concentration; **CHILD under 18 years see BNF for Children**

- **By intrathecal injection.** seek specialist advice. 1 mg daily (increased if necessary to 5 mg daily); only preservative-free, intrathecal preparation should be used; **CHILD under 18 years see BNF for Children**

**Note** For multiple daily dose regimen, one-hour (‘peak’) serum concentration should be 5–10 mg/litre (3–5 mg/litre for endocarditis); pre-dose (‘trough’) concentration should be less than 2 mg/litre (less than 1 mg/litre for endocarditis). For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration.
### Gentamicin (Non-proprietary) (Ampicillin)

**Injection**, gentamicin (as sulphate), net price 40 mg/mL, 1-mL amp = £1.40, 2-mL amp = £1.54, 2-mL vial = £1.48

**Paediatric injection**, gentamicin (as sulphate) 10 mg/mL, net price 2-mL vial = £1.80

**Intravenous injection**, gentamicin (as sulphate) 5 mg/mL, net price 1-mL amp = 74p

**Intravenous infusion**, gentamicin (as sulphate) 1 mg/mL, net price 80-mL (80 mg) bottle = £1.95; 3 mg/mL, 80-mL (240 mg) bottle = £5.95, 120-mL (360 mg) bottle = £8.45

**Cidomycin**<sup>®</sup> (Sanofi-Aventis) (Ampicillin)

**Injection**, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp or vial = £1.48

**Gentamicin**<sup>®</sup> (Amdipharm)

**Injection**, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp = £1.40

**Isotonic Gentamicin Injection**<sup>®</sup> (Baxter)

**Intravenous infusion**, gentamicin (as sulphate) 800 micrograms/mL in sodium chloride intravenous infusion 0.9%. Net price 100-mL (80-mg) Viaflex<sup>®</sup> bag = £1.61

**Electrolytes**

- Sodium: Na⁺ 15 mmol/100-mL bag
- Chloride: Cl⁻ 14 mmol/100-mL bag
- Bicarbonate: HCO₃⁻ 3 mmol/100-mL bag
- Potassium: K⁺ 4 mmol/100-mL bag
- Calcium: Ca²⁺ 1 mmol/100-mL bag
- Magnesium: Mg²⁺ 0.5 mmol/100-mL bag

### AMIKACIN

**Indications** serious Gram-negative infections resistant to gentamicin

**Cautions** see under Gentamicin; interactions: Appendix 1 (aminoglycosides)

**Contra-indications** see under Gentamicin and notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Side-effects** see under Gentamicin

**Dose** To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely

**By intramuscular or by slow intravenous injection** or by infusion, 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses in severe infections; max. 1.5 g daily for up to 10 days (max. cumulative dose 15 g); **CHILD** under 18 years see **BNF for Children**

**Note**: One-hour (‘peak’) serum concentration should not exceed 30 mg/litre; pre-dose (‘trough’) concentration should be less than 10 mg/litre

**Amikacin** (Non-proprietary)

**Injection**, amikacin (as sulphate) 250 mg/mL. Net price 2-mL vial = £10.14

**Electrolytes** Na⁺ 0.56 mmol/300-mg vial

**Amikin**<sup>®</sup> (Bristol-Myers Squibb)

**Injection**, amikacin (as sulphate) 50 mg/mL. Net price 2-mL vial = £2.07

**Electrolytes** Na⁺ < 0.5 mmol/vial

### NEOMYCIN SULPHATE

**Indications** bowel sterilisation before surgery, see also notes above

**Cautions** see under Gentamicin but too toxic for systemic use, see notes above; interactions: Appendix 1 (aminoglycosides)

**Contra-indications** see under Gentamicin; intestinal obstruction

**Hepatic impairment** absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity

**Renal impairment** avoid; ototoxic; nephrotoxic

**Pregnancy** see notes above

**Side-effects** see under Gentamicin but poorly absorbed on oral administration; increased salivation, stomatitis, impaired intestinal absorption with steatorrhoea and diarrhoea

**Dose**

- **By mouth**, pre-operative bowel sterilisation, 1 g every hour for 4 hours, then 1 g every 4 hours for 2–3 days
- **Hepatic coma**, up to 4 g daily in divided doses usually for 5–7 days

**Neomycin** (Non-proprietary)

**Tablets**, neomycin sulphate 500 mg. Net price 100 = £20.65

**Brands** include Neivemycin<sup>®</sup>

### TOBRAMYCIN

**Indications** see under Gentamicin and notes above

**Cautions** see under Gentamicin; interactions: Appendix 1 (aminoglycosides)

**Specific cautions for inhaled treatment** Other inhaled drugs should be administered before tobramycin, monitor for bronchospasm with initial dose, measure peak flow before and after nebulisation—if bronchospasm occurs, repeat test using bronchodilator; monitor renal function before treatment and then annually, severe haemoptysis

**Contra-indications** see under Gentamicin

**Renal impairment** see notes above

**Pregnancy** see notes above

**Side-effects** see under Gentamicin; **on inhalation**, mouth ulcers, taste disturbances, voice alteration, cough, bronchospasm (see Cautions)

**Dose**

- **By intramuscular injection** or by slow intravenous injection or by intravenous infusion, 3 mg/kg daily in divided doses every 8 hours, see also notes above; in severe infections up to 5 mg/kg daily in divided doses every 6–8 hours (reduced to 3 mg/kg as soon as clinically indicated); **CHILD** under 18 years see **BNF for Children**
- **Urinary-tract infection**, by intramuscular injection, 2–3 mg/kg daily as a single dose
- **Note**: One-hour (‘peak’) serum concentration should not exceed 10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre
- **Chronic pulmonary Pseudomonas aeruginosa infection in patients with cystic fibrosis**, by inhalation of nebulised solution, **ADULT** and **CHILD** over 6 years, 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

**Parenteral**

**Tobramycin** (Non-proprietary)

**Injection**, tobramycin (as sulphate) 40 mg/mL. Net price 1-mL (40-mg) vial = £4.00, 2-mL (80-mg) vial = £4.16, 6-mL (240-mg) vial = £19.20

**Inhalation**

**Bramitob**<sup>®</sup> (Chiesi)

**Nebuliser solution**, tobramycin 75 mg/mL, net price 56 × 4-mL (300-mg) unit = £1187.00

**Price**

- 2-mL vial = £1.40
- 3 mg/mL, 80-mL (240 mg) bottle = £5.95
- 120-mL (360 mg) bottle = £8.45
- 80-mL (80 mg) bottle = £1.95
- 1-mL (40-mg) vial = £4.00
- 2-mL (80-mg) vial = £4.16
- 6-mL (240-mg) vial = £19.20

**BNF 61 5.1.4 Aminoglycosides 351**
### 5.1.5 Macrolides

**Erythromycin** has an antibacterial spectrum that is similar but not identical to that of penicillin; it is thus an alternative in penicillin-allergic patients.

Indications for erythromycin include respiratory infections, whooping cough, legionnaires’ disease, and campylobacter enteritis. It is active against many penicillin-resistant staphylococci but some are now also resistant to erythromycin; it has poor activity against *Haemophilus influenzae*. Erythromycin is also active against chlamydia and mycoplasmas.

Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose (250 mg 4 times daily) but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

**Azithromycin** is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of trachoma [unlicensed indication] (section 11.3.1).

**Clarithromycin** is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily.

For the role of erythromycin, azithromycin, and clarithromycin in the treatment of Lyme disease, see section 5.1.1.3

**Spiramycin** is also a macrolide (section 5.4.7).

#### Oral infections

Clarithromycin or erythromycin is an alternative for oral infections in penicillin-allergic patients or in the presence of a beta-lactamase producing organism. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses. Metronidazole (section 5.1.11) may be preferred as an alternative to a penicillin.

**Cautions**

Macrolides should be used with caution in patients with a predisposition to QT interval prolongation (including electrolyte disturbances and concomitant use of drugs that prolong the QT interval).

**Side-effects**

Nausea, vomiting, abdominal discomfort, and diarrhoea are the most common side-effects of the macrolides, but they are mild and less frequent with azithromycin and clarithromycin than with erythromycin. Hepatotoxicity (including cholestasis jaundice) and rash occur less frequently. Other side-effects reported rarely or very rarely include pancreatitis, antibiotic-associated colitis, QT interval prolongation, arrhythmias, generally reversible hearing loss (sometimes with tinnitus) after large doses, Stevens-Johnson syndrome, and toxic epidermal necrolysis. Intravenous infusion may cause local tenderness and phlebitis.

---

### AZITHROMYCIN

**Indications**

- Respiratory-tract infections; otitis media; skin and soft-tissue infections; uncomplicated genital chlamydial infections and non-gonococcal urethritis (Table 1, section 5.1);
- Mild or moderate typhoid due to multiple-antibacterial-resistant organisms [unlicensed indication]; Lyme disease (see also section 5.1.1.3 [unlicensed indication]); prophylaxis of group A streptococcal infection (Table 2, section 5.1)

**Cautions**

- See notes above; interactions: Appendix 1 (macrolides)

**Hepatic impairment**

Manufacturers advise avoiding in severe liver disease—no information available

**Renal impairment**

- Use with caution if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy**

- Manufacturers advise use only if adequate alternatives not available

**Breast-feeding**

- Present in milk; use only if no suitable alternatives

**Side-effects**

- See notes above; also anorexia, dyspepsia, flatulence, dizziness, headache, drowsiness, convulsions, arthralgia, and disturbances in taste and smell; rarely constipation, syncope, insomnia, agitation, anxiety, asthenia, paraesthesia, hyperactivity, thrombocytopenia, haemolytic anaemia, interstitial nephritis, acute renal failure, photosensitivity, tooth and tongue discoloration

**Dose**

- 500 mg once daily for 3 days or 500 mg on first day then 250 mg once daily for 4 days; **CHILD** over 6 months 10 mg/kg once daily for 3 days; or body-weight 15–25 kg, 200 mg once daily for 3 days; body-weight 26–55 kg, 300 mg once daily for 3 days; body-weight 36–45 kg, 400 mg once daily for 3 days

- Uncomplicated genital chlamydial infections and non-gonococcal urethritis, 1 g as a single dose

- Lyme disease (see also section 5.1.1.3), typhoid [unlicensed indications], 500 mg once daily for 7–10 days (7 days in typhoid)

**Azithromycin (Non-proprietary)**

- **Capsules**, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £9.82, 6-cap pack = £14.73. Label: 5, 9, 23
- **Tablets**, azithromycin (as monohydrate hemi-etanolate) 250 mg, net price 4-tab pack = £9.83; 500 mg, 3-tab pack = £6.75. Label: 5, 9
- **Note** Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 18 years of age, and for the epidemiological treatment of their sexual partners, subject to max. single dose of 1 g, max. daily dose 1 g, and a pack size of 1 g

**Oral suspension**, azithromycin (as monohydrate) 200 mg/5 mL when reconstituted with water, net price 15-mL pack = £5.86, 30-mL pack = £11.04. Label: 5, 9

**Dental prescribing on NHS**

May be prescribed as Azithromycin Oral Suspension 200 mg/5 mL

**Zithromax® (Pfizer)**

- **Capsules**, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £7.16, 6-cap pack = £10.74. Label: 5, 9, 23
- **Oral suspension**, cherry/banana-flavoured, azithromycin (as dihydrate) 200 mg/5 mL when reconstituted with water. Net price 15-mL pack = £4.06, 22.5-mL pack = £6.10, 30-mL pack = £11.04. Label: 5, 9
**CLARITHROMYCIN**

**Indications**  respiratory-tract infections, mild to moderate skin and soft-tissue infections, otitis media; Lyme disease (see also section 5.1.1.3); Helicobacter pylori eradication (section 1.3)

**Cautions** see notes above; Interactions: Appendix 1 (macrolides)

**Hepatic impairment** hepatic dysfunction including jaundice reported

**Renal impairment** use half normal dose if eGFR less than 30 mL/minute/1.73 m²; avoid Klaricid XL® if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—present in milk

**Side-effects** see notes above; also tooth and tongue discoloration, smell and taste disturbances, stomatitis, glossitis, and headache; very rarely dizziness, insomnia, nightmares, anxiety, confusion, psychosis, paraesthesia, convulsions, hypoglycaemia, renal failure, interstitial nephritis, leucopenia, and thrombocytopenia

**Dose**

- **By mouth,** ADULT and CHILD over 12 years, 250 mg every 12 hours for 7 days, increased in pneumonia or severe infections to 500 mg every 12 hours for up to 14 days (see also Table 1, section 5.1); CHILD body-weight under 8 kg, 7.5 mg/kg twice daily; 8–11 kg, 12.5 mg/kg twice daily; 12–19 kg, 125 mg twice daily; 20–29 kg, 187.5 mg twice daily; 30–40 kg, 250 mg twice daily

- **By intravenous infusion** into larger proximal vein, ADULT and CHILD over 12 years, 500 mg every 12 hours for 14–21 days [unlicensed duration]; CHILD 1 month–12 years see BNF for Children

- **By intravenous infusion** into larger proximal vein, ADULT and CHILD over 12 years, 500 mg twice daily; CHILD 1 month–12 years see BNF for Children

**Clarithromycin (Non-proprietary)**

- **Tablets,** clarithromycin 250 mg, net price 14-tab pack = £3.17; 500 mg, 14-tab pack = £4.10. Label: 9
- **Dental prescribing on NHS** Clarithromycin Tablets may be prescribed

- **Oral suspension,** clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £6.16; 250 mg/5 mL, 70 mL = £12.36. Label: 9

- **Dental prescribing on NHS** Clarithromycin Oral Suspension may be prescribed

- **Intravenous infusion,** powder for reconstitution, clarithromycin, net price 500-mg vial = £10.31

**Klaricid® (Abbott)**

- **Tablets,** both yellow, f/c, clarithromycin 250 mg, net price 14-tab pack = £6.30; 500 mg, 14-tab pack = £10.17; 20-tab pack = £14.54. Label: 9

- **Paediatric suspension,** clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £4.73; 100 mL = £8.14; 250 mg/5 mL, 70 mL = £9.46. Label: 9

- **Granules,** clarithromycin 250 mg/sachet, net price 14-sachet pack = £11.68. Label: 9, 13

- **Intravenous infusion,** powder for reconstitution, clarithromycin. Net price 500-mg vial = £9.45

Electrolytes Na⁺ < 0.5 mmol/500-mg vial

---

**ERYTHROMYCIN**

**Indications** susceptible infections in patients with penicillin hypersensitivity; oral infections (see notes above); campylobacter enteritis, syphilis, non-gonococcal urethritis, respiratory-tract infections (including Legionella infection), skin infections (Table 1, section 5.1); chronic prostatitis; prophylaxis of diphtheria, group A streptococcal infection, and whooping cough (Table 2, section 5.1); acne vulgaris and rosacea (section 13.6)

**Cautions** see notes above; neonate under 2 weeks (risk of hypertrophic pyloric stenosis); avoid in acute porphyria (section 9.8.2); Interactions: Appendix 1 (macrolides)

**Hepatic impairment** may cause idiosyncratic hepatotoxicity

**Renal impairment** max. 1.5 g daily in severe renal impairment (ototoxicity)

**Pregnancy** not known to be harmful

**Breast-feeding** only small amounts in milk—not known to be harmful

**Side-effects** see notes above; also myasthenia-like syndrome

**Dose**

- **By mouth,** ADULT and CHILD over 8 years, 250–500 mg every 6 hours or 0.5–1 g every 12 hours (see notes above) up to 4 g daily in divided doses in severe infections; NEONATE 12.5 mg/kg every 6 hours; CHILD 1 month–2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours, doses doubled for severe infections

- **Early synphils,** 500 mg 4 times daily for 14 days

- **Uncomplicated genital chlamydia,** non-gonococcal urethritis, 500 mg twice daily for 14 days

- **Lyme disease** (see also section 5.1.1.3), 500 mg 4 times daily for 14–21 days

- **By intravenous infusion,** ADULT and CHILD severe infections, 12.5 mg/kg every 6 hours; mild infections (when oral treatment not possible), 6.25 mg/kg every 6 hours; NEONATE see BNF for Children

**Erythromycin (Non-proprietary)**

- **Capsules,** enclosing e/c microgranules, erythromycin 250 mg, net price 28–cap pack = £15.00. Label: 5, 9, 25

- **Brands include** Tilor®

- **Tablets,** e/c, erythromycin 250 mg, net price 28 = £1.54. Label: 5, 9, 25

- **Dental prescribing on NHS** Erythromycin Tablets e/c may be prescribed

**Erythromycin Ethyl Succinate (Non-proprietary)**

- **Oral suspension,** erythromycin (as ethyl succinate) for reconstitution with water 125 mg/5 mL, net price 100 mL = £1.99; 250 mg/5 mL, 100 mL = £2.64; 500 mg/5 mL, 100 mL = £4.31. Label: 9

- **Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

- **Brands include** Primacin®

- **Dental prescribing on NHS** Erythromycin Ethyl Succinate Oral Suspension may be prescribed
Erythromycin Lactobionate (Non-proprietary)  

**Intravenous infusion** powder for reconstitution, erythromycin (as lactobionate), net price 1-g vial = £9.98

**Erymax** (Cephalon)  
**Capsules** opaque orange/clear orange, enclosing orange and white e/c pellets, erythromycin 250 mg, net price 28-cap pack = £5.61, 112-cap pack = £22.44. Label: 5, 9, 25

Dose 1 capsule every 6 hours or 2 capsules every 12 hours; acne, 1 capsule twice daily for 1 month then 1 capsule daily

**Erythrocin** (Amidipharm)  
**Tablets** both f/c, erythromycin (as stearate), 250 mg, net price 100 = £18.20; 500 mg, 100 = £36.40. Label: 9

**Dental prescribing on NHS** May be prescribed as Erythromycin Stearate Tablets

**Erythroped A** (Amidipharm)  
**Suspension SF** sugar-free, banana-flavoured, erythromycin (as ethyl succinate) for reconstitution with water, 125 mg/5 mL (Suspension PI SF), net price 140 mL = £3.06; 250 mg/5 mL, 140 mL = £5.95; 500 mg/5 mL (Suspension SF Forte), 140 mL = £10.56. Label: 9

**Erythroped A** (Amidipharm)  
**Tablets**, yellow, f/c, erythromycin 500 mg (as ethyl succinate), Net price 28-tab pack = £10.78. Label: 9

**Dental prescribing on NHS** May be prescribed as Erythromycin Ethyl Succinate Tablets

**Telithromycin**

The ketolide telithromycin is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant *Streptococcus pneumoniae*. Telithromycin should only be used to treat beta-haemolytic streptococcal pharyngitis and tonsillitis, sinusitis, community-acquired pneumonia, and exacerbations of chronic bronchitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated.

**TELITHROMYCIN**

**Indications** see notes above

**Cautions** coronary heart disease, ventricular arrhythmias, bradycardia, hypokalaemia, hypomagnesaemia—risk of QT interval prolongation; concomitant administration of drugs that prolong QT-interval; avoid in acute porphyria (section 9.8.2); **interactions**: Appendix 1 (telithromycin)

**Hepatic disorders** Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop

**Driving** Visual disturbances or transient loss of consciousness may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected

**Contra-indications** myasthenia gravis; history of telithromycin-associated hepatitis or jaundice; prolongation of QT interval; congenital or family history of QT interval prolongation (if not excluded by ECG)

**Hepatic impairment** manufacturer advises caution; see also Hepatic Disorders above

**Renal impairment** manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m²—if no alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose

**Pregnancy** toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** diarrhoea, nausea, vomiting, flatulence, abdominal pain, taste disturbances; dizziness, headache; less commonly constipation, stomatitis, anorexia, hepatitis, flushing, palpitations, drowsiness, insomnia, nervousness, eosinophilia, blurred vision, rash, urticaria, and pruritus; rarely choletic jaundice, arthrythmias, hypotension, transient loss of consciousness, paraesthesia, and diplopia; very rarely antibiotic-associated colitis, altered sense of smell, muscle cramp, erythema multiforme; also reported pancreatitis, confusion, hallucinations and arthralgia

**Dose**

- 800 mg once daily for 5 days for sinusitis or exacerbation of chronic bronchitis or for 7–10 days in community-acquired pneumonia; **CHILD** under 18 years safety and efficacy not established
- Tonsillitis or pharyngitis caused by *Streptococcus pyogenes*, **ADULT** and **CHILD** over 12 years, 800 mg once daily for 5 days

**Ketek** (Sanofi-Aventis)  
**Tablets**, orange, f/c, telithromycin 400 mg, net price 10-tab pack = £18.56. Label: 9, counselling, driving, hepatic disorders

### 5.1.6 Clindamycin

Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

Clindamycin is recommended for staphylococcal joint and bone infections such as osteomyelitis, and intra-abdominal sepsis; it is an alternative to macrolides for erysipelas or cellulitis in penicillin-allergic patients. Clindamycin can also be used for infections associated with meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections.

Clindamycin has been associated with antibiotic-associated colitis (section 1.5), which may be fatal; it is most common in middle-aged and elderly women, especially following an operation. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

**Oral infections** Clindamycin should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

### Renal impairment

Manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m²—if no alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose

### Pregnancy

Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk

### Breast-feeding

Manufacturer advises avoid—present in milk in animal studies

### Side-effects

Diarrhoea, nausea, vomiting, flatulence, abdominal pain, taste disturbances; dizziness, headache; less commonly constipation, stomatitis, anorexia, hepatitis, flushing, palpitations, drowsiness, insomnia, nervousness, eosinophilia, blurred vision, rash, urticaria, and pruritus; rarely choletic jaundice, arrhythmias, hypotension, transient loss of consciousness, paraesthesia, and diplopia; very rarely antibiotic-associated colitis, altered sense of smell, muscle cramp, erythema multiforme; also reported pancreatitis, confusion, hallucinations and arthralgia

### Dose

- 800 mg once daily for 5 days for sinusitis or exacerbation of chronic bronchitis or for 7–10 days in community-acquired pneumonia; **CHILD** under 18 years safety and efficacy not established
- Tonsillitis or pharyngitis caused by *Streptococcus pyogenes*, **ADULT** and **CHILD** over 12 years, 800 mg once daily for 5 days

### Ketek

Tablets, orange, f/c, telithromycin 400 mg, net price 10-tab pack = £18.56. Label: 9, counselling, driving, hepatic disorders

**BNF 61**
**CLINDAMYCIN**

**Indications** see notes above; staphylococcal bone and joint infections, peritonitis; *falciparum* malaria (section 5.4.1)

**Cautions** discontinue immediately if diarrhoea or colitis develops; monitor liver and renal function if treatment exceeds 10 days, and in neonates and infants; avoid rapid intravenous administration; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (clindamycin)

**Contra-indications** diarrhoeal states; avoid injections containing benzyl alcohol in neonates (see under preparations below)

**Pregnancy** not known to be harmful

**Breast-feeding** amount probably too small to be harmful but bloody diarrhoea reported in 1 infant

**Side-effects** diarrhoea (discontinue treatment), abdominal discomfort, oesophagitis, oesophageal ulcers, taste disturbances, nausea, vomiting, antibiotic-associated colitis; jaundice; leucopenia, eosinophilia, and thrombocytopenia reported; polyarthritis reported; rash, pruritus, urticaria, anaphylactoid reactions; Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative and vesiculobullous dermatitis reported; pain, induration, and abscess after intramuscular injection; thrombophlebitis after intravenous injection

**Dose**
- **By mouth**, 150–300 mg every 6 hours; up to 450 mg every 6 hours in severe infections; **CHILD**, 3–6 mg/kg every 6 hours
- **Counselling** Patients should discontinue immediately and contact doctor if diarrhoea develops; capsules should be swallowed with a glass of water
- **By deep intramuscular injection** or by intravenous infusion, 0.6–2.7 g daily (in 2–4 divided doses); life-threatening infection, up to 4.8 g daily; single doses above 600 mg by intravenous infusion only; single doses by intravenous infusion not to exceed 1.2 g; **CHILD** over 1 month, 15–40 mg/kg daily in 3–4 divided doses; severe infections, at least 300 mg daily regardless of weight

**Clindamycin** (Non-proprietary) (Pharmacia)

**Capsules**, clindamycin (as hydrochloride) 150 mg, net price 24-cap pack = £11.75. Label: 9, 27, counselling, see above (diarrhoea)

**Dental prescribing on NHS** Clindamycin Capsules may be prescribed

**Dalacin C** (Pharmacia) (Non-proprietary)

**Capsules**, clindamycin (as hydrochloride) 75 mg (green/white), net price 24-cap pack = £7.45. 150 mg, (white), 24-cap pack = £13.72. Label: 9, 27, counselling, see above (diarrhoea)

**Dental prescribing on NHS** May be prescribed as Clinda- mycin Capsules

**Injection**, clindamycin (as phosphate) 150 mg/mL, net price 2-ml amp = £5.20; 4-ml amp = £12.35

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p 2)

5.1.7 Some other antibacterials

Antibacterials discussed in this section include chloramphenicol, fusidic acid, glycopeptide antibiotics (vancomycin and teicoplanin), linezolid, and the poly- mycin, colistin.

**Chloramphenicol**

Chloramphenicol is a potent broad-spectrum antibiotic; however, it is associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections, particularly those caused by *Haemophilus influenzae*, and also for typhoid fever.

Chloramphenicol eye drops (section 11.3.1) and chloramphenicol ear drops (section 12.1.1) are also available.

**CHLORAMPHENICOL**

**Indications** see notes above

**Cautions** avoid repeated courses and prolonged treatment; blood counts required before and periodically during treatment; monitor plasma-chloramphenicol concentration in neonates (see below); **interactions:** Appendix 1 (chloramphenicol)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** avoid if possible—increased risk of bone-marrow depression; reduce dose and monitor plasma-chloramphenicol concentration

**Renal impairment** avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis

**Pregnancy** manufacturer advises avoid; neonatal ‘grey syndrome’ if used in third trimester

**Breast-feeding** manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause ‘grey syndrome’

**Side-effects** blood disorders including reversible and irreversible aplastic anaemia (with reports of resulting leukaemia), peripheral neuritis, optic neuritis, headache, depression, urticaria, erythema multiforme, nausea, vomiting, diarrhoea, stomatitis, glossitis, dry mouth; nocturnal haemoglobinuria reported; grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism

**Dose**
- **By mouth** or by intravenous injection or infusion, 12.5 mg/kg every 6 hours (exceptionally, can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated); **CHILD** over 1 month, 12.5 mg/kg twice daily; 2 weeks–1 month, 12.5 mg/kg 2–4 times daily

**Note** Plasma concentration monitoring required in neonates and preferred in those under 4 years of age, in the elderly, and in hepatic impairment; recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose (‘trough’) concentration should not exceed 15 mg/litre

**Chloramphenicol** (Non-proprietary) (Pharmacia)

**Capsules**, chloramphenicol 250 mg. Net price 60 = £377.00

**Kemicetine** (Pharmacia) (Non-proprietary)

**Injection**, powder for reconstitution, chloramphenicol (as sodium succinate). Net price 1-g vial = £1.59

**Electrolytes** Na⁺ 134 mmol/l
Fusidic acid

Fusidic acid and its salts are narrow-spectrum antibiotics. The only indication for their use is in infections caused by penicillin-resistant staphylococci, especially osteomyelitis, as they are well concentrated in bone; they are also used for staphylococcal endocarditis. A second antistaphylococcal antibiotic is usually required to prevent emergence of resistance.

**SO D I U M F U S I D A T E**

**Indications** penicillin-resistant staphylococcal infection including osteomyelitis; staphylococcal endocarditis in combination with other antibacterials (Table 1, section 5.1)

**Cautions** monitor liver function with high doses or on prolonged therapy; elimination may be reduced in biliary disease or biliary obstruction; **interactions:** Appendix 1 (fusidic acid)

**Hepatic impairment** impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose; monitor liver function

**Pregnancy** not known to be harmful; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** present in milk—manufacturer advises caution

**Side-effects** nausea, vomiting, reversible jaundice, especially after high dosage or rapid infusion (withdraw therapy if persistent); rarely hypersensitivity reactions, acute renal failure (usually with jaundice), blood disorders

**Dose**
- See under Preparations, below

**Sodium fusidate** (LEO)

**Intravenous infusion**, powder for reconstitution, sodium fusidate 500 mg (= fusidic acid 480 mg), with buffer, net price per vial (with diluent) = £70.04

**Dose** as sodium fusidate, by intravenous infusion, ADULT over 50 kg, 500 mg 3 times daily, ADULT under 50 kg and CHILD, 6–7 mg/kg 3 times daily

**Fucidin** (LEO)

**Tablets**, f/c, sodium fusidate 250 mg, net price 10-tab pack = £6.02. Label: 9

**Dose** as sodium fusidate, 500 mg every 8 hours, doubled for severe infections

**Skin infection**, as sodium fusidate, 250 mg every 12 hours for 5–10 days

**Suspension**, off-white, banana- and orange-flavoured, fusidic acid 250 mg/5 mL, net price 50 mL = £6.73. Label: 9, 21

**Dose** as fusidic acid, ADULT 750 mg every 8 hours; CHILD up to 1 year 50 mg/kg/daily (in 3 divided doses), 1–5 years 250 mg every 8 hours, 5–12 years 500 mg every 8 hours

**Note** Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets

**Vancomycin and teicoplanin**

The glycopeptide antibiotics vancomycin and teicoplanin have bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

Vancomycin is used by the intravenous route in the treatment of endocarditis and other serious infections caused by Gram-positive cocci. It has a long duration of action and can therefore be given every 12 hours. Vancomycin (added to dialysis fluid) is also used in the treatment of peritonitis associated with peritoneal dialysis [unlicensed route] (Table 1 section 5.1).

Vancomycin given by mouth for 10–14 days is effective in the treatment of *Clostridium difficile* infection (see also section 1.5); low doses are considered adequate (higher dose may be considered if the infection fails to respond or if it is life threatening). Vancomycin should not be given by mouth for systemic infections since it is not significantly absorbed.

Teicoplanin is similar to vancomycin but has a significantly longer duration of action allowing once-daily administration. Unlike vancomycin, teicoplanin can be given by intramuscular as well as by intravenous injection; it is not given by mouth.

**Vancomycin**

**Indications** see notes above

**Cautions** avoid rapid infusion (risk of anaphylactoid reactions, see Side-effects); rotate infusion sites; elderly, avoid if history of deafness; all patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment), blood counts, urinalysis, and renal function tests; monitor auditory function in elderly or if renal impairment; teicoplanin sensitivity; systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses; **interactions:** Appendix 1 (vancomycin)

**Renal impairment** reduce dose—monitor plasma-vancomycin concentration and renal function regularly; see also Cautions above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity

**Breast-feeding** present in milk—significant absorption following oral administration unlikely

**Side-effects** after parenteral administration: nephrotoxicity including renal failure and interstitial nephritis; ototoxicity (discontinue if tinnitus occurs); blood disorders including neutropenia (usually after 1 week or cumulative dose of 2.5 g), rarely agranulocytosis and thrombocytopenia; nausea; chills, fever; eosinophilia, anaphylaxis, rashes (including exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, and vasculitis); phlebitis (irritant to tissue); on rapid infusion, severe hypotension (including shock and cardiac arrest), wheezing, dyspnoea, urticaria, pruritus, flushing of the upper body (‘red man’ syndrome), pain and muscle spasm of back and chest

**Dose**
- **By mouth**, *Clostridium difficile* infection, (see also notes above), **ADULT** and **CHILD** over 12 years, 125 mg every 6 hours for 10–14 days (increased up to 500 mg every 6 hours if infection fails to respond or is life-threatening); **CHILD 1 month–5 years, 5 mg/kg every 6 hours for 10–14 days (increased up to 10 mg/kg every 6 hours if infection fails to respond or is life-threatening); 5–12 years, half adult dose
By intravenous infusion, 1–1.5 g every 12 hours; ELDERLY over 65 years, 500 mg every 12 hours or 1 g once daily; CHILD over 1 month, 15 mg/kg every 8 hours (max. 2 g daily)

Note Plasma concentration monitoring required (see Cautions above); pre-dose (‘trough’) concentration should be 10–15 mg/litre (15–20 mg/litre for less sensitive strains of meticillin-resistant Staphylococcus aureus)

● Surgical prophylaxis, by intravenous infusion, ADULT over 18 years, 1 g

Note Vancomycin doses in BNF may differ from those in product literature

Vancomycin (Non-proprietary)

Capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £132.47; 250 mg, 28-cap pack = £132.47. Label: 9

Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £7.25; 1-g vial = £14.50

Note Can be used to prepare solution for oral administration

Vanocin® (Flynn)

Matrigel capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £88.31. Label: 9

Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £8.05; 1-g vial = £16.11

Note Can be used to prepare solution for oral administration

5.1.7 Some other antibacterials

Daptomycin

Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. Daptomycin should be reserved for complicated skin and soft-tissue infections caused by resistant Gram-positive bacteria including meticillin-resistant Staphylococcus aureus (MRSA). It needs to be given with other antibiotics for mixed infections involving Gram-negative bacteria and some anaerobes.

The Scottish Medicines Consortium (p. 4) has advised (February 2008) that daptomycin (Cubicin®) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

DAPTOMYCIN

Indications see under Dose

Cautions interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose; interactions: Appendix 1 (daptomycin)

Muscle effects Myalgia, muscle weakness, and myositis may occur uncommonly; rhabdomyolysis is very rare. Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment, or if receiving another drug known to cause myopathy (preferably avoid concomitant use), or if eGFR less than 30 mL/

BNF 61

Note Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise treatment in some patients (see Cautions). Pre-dose (‘trough’) concentrations should be greater than 10 mg/litre (greater than 15–20 mg/litre in endocarditis; greater than 20 mg/litre in deep-seated infection such as bone and joint infection), but less than 60 mg/litre. Teicoplanin doses in BNF may differ from those in product literature

Targocid® (Sanofi-Aventis)

Injection, powder for reconstitution, teicoplanin, net price 200-mg vial (with diluent) = £3.57; 400-mg vial (with diluent) = £6.10

Electrolytes Na+<sub>+</sub> 0.5 mmol/200- and 400-mg vial

Daptomycin dose

By intravenous injection or infusion, ADULT body-weight under 70 kg, initially 400 mg every 12 hours for 3 doses, subsequently 400 mg once daily (subsequent doses can alternatively be given by intramuscular injection); body-weight over 70 kg, initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg daily; higher doses may be required in severe infection (including burns, sepsicaemia, septic arthritis, and osteomyelitis), consult product literature
Infections

5 Infections

5.1.7 Some other antibacterials

minute/1.73 m²). If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine kinase elevated markedly.

Hepatic impairment manufacturer advises caution in severe hepatic impairment—no information available

Renal impairment see Muscle Effects above; also monitor renal function if eGFR less than 80 mL/minute/1.73 m²; use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid

Side-effects nausea, vomiting, abdominal pain, flatulence, diarrhea (antibiotic-associated colitis reported), constipation, hypertension, hypotension, headache, anxiety, insomnia, dizziness, asthenia, anaemia, arthralgia, rash, pruritus, injection-site reactions; less commonly dyspepsia, anorexia, taste disturbance, glossitis, flushing, arthralgias, tremor, paresthesia, hyperglycaemia, renal failure, eosinophilia, thrombocytopenia, electrolyte disturbances, muscle effects (see Cautions); rarely jaundice; also reported syncope, wheezing, pulmonary eosinophilia, peripheral neuropathy

Dose

By slow intravenous injection over 2 minutes or by intravenous infusion, complicated skin and soft-tissue infections caused by Gram-positive bacteria, ADULT over 18 years, 4 mg/kg once daily; increased to 6 mg/kg once daily if associated with Staphylococcus aureus bacteremia

Right-sided endocarditis caused by Staphylococcus aureus, ADULT over 18 years, 6 mg/kg once daily

Cubicin® (Novartis) ▼ [Hal]

Intravenous infusion, powder for reconstitution, daptomycin, net price 350-mg vial = £26.00; 500-mg vial = £88.57

**Linezolid**

Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including metillin-resistant *Staphylococcus aureus* (MRSA), and vancomycin-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is an option if a glycopeptide, such as vancomycin, cannot be used to treat pneumonia or severe skin and soft-tissue infections caused by MRSA. Linezolid is not active against Gram-negative organisms and must be given with other antibacterials if the infection also involves Gram-negative organisms (the combination should be used for mixed skin and soft tissue infections only when other treatments are not available). A higher incidence of blood disorders and optic neuropathy have been reported in patients receiving linezolid for more than 28 days. The CHM advice (optic neuropathy) Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately.
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary.
- visual function should be monitored regularly if treatment is required for longer than 28 days.

Monoamine oxidase inhibition Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs. SHT, agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgetics. For other interactions see Appendix 1 (MAOIs)

Contra-indications see Monoamine Oxidase Inhibition above

Hepatic impairment in severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk

Renal impairment manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m²; see also Blood Disorders, above

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—present in milk in animal studies

**SIDE-EFFECTS** diarrhea (antibiotic-associated colitis reported), nausea, vomiting, taste disturbances, headache; less commonly thirst, dry mouth, glossitis, stomatitis, tongue discolouration, abdominal pain, dyspepsia, gastritis, constipation, pancreatitis, hypertension, fever, fatigue, dizziness, insomnia, hypoaesthesia, paraesthesia, tinnitus, polyuria, leucopenia, thrombocytopenia, eosinophilia, electrolyte disturbances, blurred vision, rash, pruritus, diarrhoea, injection-site reactions; rarely tachycardia, transient ischaemic attacks, renal failure; also reported tooth discoloration, convulsions, lactic acidosis, pancytopenia, anaemia, Stevens-Johnson syndrome,

Blood disorders Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days.
- have pre-existing myelosuppression.
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function.
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

**CHM advice (optic neuropathy)** Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately.
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary.
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**LINEZOLID**

**Indications** pneumonia, complicated skin and soft-tissue infections caused by Gram-positive bacteria (initiated under expert supervision)

**Cautions** monitor full blood count (including platelet count) weekly (see also Blood disorders below); history of seizures; unless close observation and blood-pressure monitoring possible, avoid in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states; interactions: Appendix 1 (MAOIs)

**Dose**

- For intravenous infusion, see above
- For oral use, see above

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, vomiting, abdominal pain, flatulence, diarrhea (antibiotic-associated colitis reported), constipation, hypertension, hypotension, headache, anxiety, insomnia, dizziness, asthenia, anaemia, arthralgia, rash, pruritus, injection-site reactions; less commonly dyspepsia, anorexia, taste disturbance, glossitis, flushing, arthralgias, tremor, paresthesia, hyperglycaemia, renal failure, eosinophilia, thrombocytopenia, electrolyte disturbances, muscle effects (see Cautions); rarely jaundice; also reported syncope, wheezing, pulmonary eosinophilia, peripheral neuropathy

**Dose**

- By slow intravenous injection over 2 minutes or by intravenous infusion, complicated skin and soft-tissue infections caused by Gram-positive bacteria, ADULT over 18 years, 4 mg/kg once daily; increased to 6 mg/kg once daily if associated with *Staphylococcus aureus* bacteremia

- Right-sided endocarditis caused by *Staphylococcus aureus*, ADULT over 18 years, 6 mg/kg once daily

**Cubicin® (Novartis) ▼ [Hal]**

- Intravenous infusion, powder for reconstitution, daptomycin, net price 350-mg vial = £26.00; 500-mg vial = £88.57

**Linezolid**

Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including metillin-resistant *Staphylococcus aureus* (MRSA), and vancomycin-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is an option if a glycopeptide, such as vancomycin, cannot be used to treat pneumonia or severe skin and soft-tissue infections caused by MRSA. Linezolid is not active against Gram-negative organisms and must be given with other antibacterials if the infection also involves Gram-negative organisms (the combination should be used for mixed skin and soft tissue infections only when other treatments are not available). A higher incidence of blood disorders and optic neuropathy have been reported in patients receiving linezolid for more than 28 days. The CHM advice (optic neuropathy) Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately.
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary.
- visual function should be monitored regularly if treatment is required for longer than 28 days.

Monoamine oxidase inhibition Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs. SHT, agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgetics. For other interactions see Appendix 1 (MAOIs)

Contra-indications see Monoamine Oxidase Inhibition above

Hepatic impairment in severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk

Renal impairment manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m²; see also Blood Disorders, above

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects diarrhea (antibiotic-associated colitis reported), nausea, vomiting, taste disturbances, headache; less commonly thirst, dry mouth, glossitis, stomatitis, tongue discolouration, abdominal pain, dyspepsia, gastritis, constipation, pancreatitis, hypertension, fever, fatigue, dizziness, insomnia, hypoaesthesia, paraesthesia, tinnitus, polyuria, leucopenia, thrombocytopenia, eosinophilia, electrolyte disturbances, blurred vision, rash, pruritus, diarrhoea, injection-site reactions; rarely tachycardia, transient ischaemic attacks, renal failure; also reported tooth discoloration, convulsions, lactic acidosis, pancytopenia, anaemia, Stevens-Johnson syndrome,
5.1.8 Sulfonamides and trimethoprim

The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity. However, co-trimoxazole is associated with rare but serious side-effects (e.g. Stevens-Johnson syndrome and blood dyscrasias, notably bone marrow depression and agranulocytosis) especially in the elderly (see Restrictions on the use of co-trimoxazole below).

Trimethoprim can be used alone for urinary- and respiratory-tract infections and for prostatitis, shigellosis,
and invasive salmonella infections. Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently. For topical preparations of sulfonamides used in the treatment of burns see section 13.10.1.1.

### CO-TRIMOXAZOLE

A mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts

#### Indications

- see restrictions above

#### Cautions

- maintain adequate fluid intake; avoid in blood disorders (unless under specialist supervision); monitor blood counts on prolonged treatment; discontinue immediately if blood disorders or rash develop; predisposition to folate deficiency or hyperkalaemia; elderly (see Restrictions on the use of Co-trimoxazole above); asthma; G6PD deficiency (section 9.1.5); avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia); interactions: Appendix 1 (trimethoprim, sulfamethoxazole)

#### Hepatic impairment

- manufacturer advises avoid in acute porphyria (section 9.8.2)

#### Renal impairment

- use half normal dose if eGFR 15–30 mL/minute/1.73 m²; avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored

#### Pregnancy

- teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

#### Breast-feeding

- small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole)

#### Side-effects

- nausea, diarrhoea; headache; hyperkalaemia; rash (very rarely including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity)—discontinue immediately; less commonly: vomiting; very rarely: glossitis, stomatitis, anorexia, liver damage (including jaundice and hepatic necrosis), pancreatitis, antibiotic-associated colitis, myocardiitis, cough and shortness of breath, pulmonary infiltrates, aspetic meningitis, depression, convulsions, peripheral neuropathy, ataxia, tinnitus, vertigo, hallucinations, hypoglycaemia, blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia), hyponatraemia, renal disorders including interstitial nephritis, arthralgia, myalgia, vasculitis, systemic lupus erythematosus and uveitis; rhabdomyolysis reported in HIV-infected patients

#### Dose

- **By mouth**
  - trimethoprim 16 mg/kg daily in 2–4 divided doses for 14–21 days
  - prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections, by mouth, 960 mg once daily (may be reduced to 480 mg once daily to improve tolerance) or 960 mg on alternate days (3 times a week) or 960 mg twice daily on alternate days (3 times a week)
  - CHILD 6 weeks–5 months, 120 mg twice daily on 3 consecutive or alternate days per week or on 7 days per week; 6 months–5 years, 240 mg, 6–12 years, 480 mg

- **Note** 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg

#### Co-trimoxazole (Non-proprietary)

- **Tablets**, co-trimoxazole 480 mg, net price 28-tab pack = £18.99, 960 mg, 100 = £23.46. Label: 9
- **Brands include**: Fectrim®, Fectrin®, Forte

- **Paediatric oral suspension**, co-trimoxazole 240 mg/5 mL, net price 100 mL = £1.12. Label: 9
- **Oral suspension**, co-trimoxazole 485 mg/5 mL. Net price 100 mL = £4.41. Label: 9

- **Seprin®** (Aspen)
- **Tablets**, co-trimoxazole 480 mg, net price 100-tab pack = £15.52. Label: 9
- **Forte tablets**, scored, co-trimoxazole 960 mg, net price 100-tab pack = £23.46. Label: 9
- **Adult suspension**, co-trimoxazole 480 mg/5 mL, net price 100 mL (vanilla-flavoured) = £4.41. Label: 9
- **Paediatric suspension**, sugar-free, co-trimoxazole 240 mg/5 mL, net price 100 mL (banana- and vanilla-flavoured) = £2.45. Label: 9
- **Intravenous infusion**, co-trimoxazole 96 mg/mL. To be diluted before use. Net price 5-mL amp = £1.78
- **Electrolytes** Na⁺ 1.7 mmol/5 mL
- **Excipients** include alcohol 13.2%, propylene glycol, sulphates

### SULFADIAZINE

(Sulphadiazine)

#### Indications

- prevention of rheumatic fever recurrence, toxoplasmosis [unlicensed]—see section 5.4.7

#### Cautions

- see under Co-trimoxazole; interactions: Appendix 1 (sulfonamides)

#### Contra-indications

- see under Co-trimoxazole

#### Hepatic impairment

- use with caution in mild to moderate impairment; avoid in severe impairment

#### Renal impairment

- use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria

#### Pregnancy

- neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

#### Breast-feeding

- small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

#### Side-effects

- see under Co-trimoxazole; also hypothyroidism, benign intracranial hypertension, optic neuropathy

#### Dose

- **Prevention of rheumatic fever, by mouth**, 1 g daily (500 mg daily for patients less than 30 kg)

#### Sulfadiazine (Non-proprietary)

- **Tablets**, sulfadiazine 500 mg, net price 56-tab pack = £37.50. Label: 9, 27

### TRIMETHOPRIM

#### Indications

- urinary-tract infections, acute and chronic bronchitis; pneumocystis pneumonia (section 5.4.8)

#### Cautions

- predisposition to folate deficiency; elderly; manufacturer recommends blood counts on long-
term therapy (but evidence of practical value unsatisfactory); neonates (specialist supervision required); acute porphyria (section 9.8.2); interactions: Appendix 1 (trimethoprim).

**Blood disorders** On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

**Contra-indications** blood dyscrasias.

**Renal impairment** use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m²; use half normal dose if eGFR less than 15 mL/minute/1.73 m² (monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m²).

**Pregnancy** teratogenic risk in first trimester (folate antagonists); manufacturers advise avoid.

**Breast-feeding** present in milk—short-term use not known to be harmful.

**Side-effects** gastro-intestinal disturbances including nausea, vomiting, diarrhoea, dyspepsia, depression of haematopoiesis; rarely erythema multiforme, toxic epidermal necrolysis, photosensitivity and other allergic reactions including angioedema and anaphylaxis; aseptic meningitis and uveitis reported.

**Dose**
- Acute infections, 200 mg every 12 hours; **CHILD** 1 month–12 years, 4 mg/kg (max. 200 mg) every 12 hours; or 6 weeks–6 months 25 mg every 12 hours, 6 months–6 years 50 mg every 12 hours, 6–12 years 100 mg every 12 hours.
- Prophylaxis, 100 mg at night; **CHILD** under 12 years, 2 mg/kg (max.100 mg) at night.

**Trimethoprim** (Non-proprietary) (non)
- Tablets, trimethoprim 100 mg, net price 28 = 94p; 200 mg, 14-tab pack = 91p. Label: 9. Brands includeTrimopan.
- Suspension, trimethoprim 50 mg/5 mL, net price 100 mL = £2.37. Label: 9.

## 5.1.9 Antituberculosis drugs

Tuberculosis is treated in two phases—an initial phase using 4 drugs and a continuation phase using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge, particularly where the disease involves resistant organisms or non-respiratory organs.

The regimens given below are recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen described below should be used; the two regimens should not be used concurrently.

### Initial phase

The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance.

The treatment of choice for the initial phase is the daily use of isoniazid, rifampicin, pyrazinamide and ethambutol. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

**Streptomycin** is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

### Continuation phase

After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

**Unsupervised treatment** The following regimen should be used for patients who are likely to take antituberculous drugs reliably without supervision. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

**Recommended dosage for standard unsupervised 6-month treatment**

**Rifater** [rifampicin, isoniazid, and pyrazinamide] (for 2-month initial phase only)
- **ADULT** body-weight under 40 kg 3 tablets daily, body-weight 40–49 kg 4 tablets daily, body-weight 50–64 kg 5 tablets daily; body-weight over 65 kg 6 tablets daily.
- **Ethambutol** (for 2-month initial phase only)
- **ADULT AND CHILD** 15 mg/kg daily.

**Rifinah** [rifampicin and isoniazid] (for 4-month continuation phase following initial treatment with Rifater®)
- **ADULT** body-weight under 50 kg 3 tablets daily of Rifinah® 150/100, body-weight 50 kg and over, 2 tablets daily of Rifinah® 300/150.
- **or** (if combination preparations not appropriate): **Isoniazid** (for 2-month initial and 4-month continuation phases)
- **ADULT** 300 mg daily; **CHILD** 10 mg/kg (max. 300 mg) daily.
- **Rifampicin** (for 2-month initial and 4-month continuation phases)
- **ADULT** body-weight under 50 kg 450 mg daily; body-weight 50 kg and over, 600 mg daily; **CHILD** 10 mg/kg daily (max. 450 mg daily if body-weight under 50 kg; max. 600 mg daily if body-weight 50 kg and over).

**Pyrazinamide** (for 2-month initial phase only)
- **ADULT** body-weight under 50 kg 1.5 g daily, body-weight 50 kg and over, 2 g daily; **CHILD** 35 mg/kg daily (max. 1.5 g daily if body-weight under 50 kg; max. 2 g daily if body-weight 50 kg and over).
- **Ethambutol** (for 2-month initial phase only)
- **ADULT AND CHILD** 15 mg/kg daily.

**Pregnancy** The standard regimen (above) may be used during pregnancy. Streptomycin should not be given in pregnancy.

**Breast-feeding** The standard regimen (above) may be used during breast-feeding.

**Children** Children are given isoniazid, rifampicin, pyrazinamide, and ethambutol for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol because of the difficulty in testing eye-sight and in obtaining reports of visual symptoms (see below).
Supervised treatment Drug administration needs to be fully supervised (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

Recommended dosage for intermittent supervised 6-month treatment

Isoniazid (for 2-month initial and 4-month continuation phases)
- **ADULT AND CHILD** 15 mg/kg (max. 900 mg) 3 times a week

Rifampicin (for 2-month initial and 4-month continuation phases)
- **ADULT** 600–900 mg 3 times a week; **CHILD** 15 mg/kg (max. 900 mg) 3 times a week

Pyrazinamide (for 2-month initial phase only)
- **ADULT** body-weight under 50 kg 2 g 3 times a week; body-weight 50 kg and over; 2.5 g 3 times a week; **CHILD** 50 mg/kg 3 times a week (max. 2 g 3 times a week if body-weight under 50 kg; max. 2.5 g 3 times a week if body-weight 50 kg and over)

Ethambutol (for 2-month initial phase only)
- **ADULT AND CHILD** 30 mg/kg 3 times a week

Immunocompromised patients Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in an HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

Corticosteroids In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

Prevention of tuberculosis Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months, see Table 2, section 5.1. For advice on immunisation against tuberculosis, see section 14.4

Monitoring Since isoniazid, rifampicin and pyrazinamide are associated with liver toxicity, hepatic function should be checked before treatment with these drugs. Those with pre-existing liver disease or alcohol dependence should have frequent checks particularly in the first 2 months. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. In view of the need to comply fully with antituberculosis treatment on the one hand and to guard against serious liver damage on the other, patients and their carers should be informed carefully how to recognise signs of liver disorders and advised to discontinue treatment and seek immediate medical attention should symptoms of liver disease occur.

Renal function should be checked before treatment with antituberculous drugs and appropriate dosage adjustments made. Streptomycin or ethambutol should preferably be avoided in patients with renal impairment, but if used, the dose should be reduced and the plasma drug concentration monitored.

Visual acuity should be tested before ethambutol is used (see below).

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication. Its only common side-effect is peripheral neuropathy which is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, malnutrition and HIV infection. In these circumstances pyridoxine 10 mg daily (or 20 mg daily if suitable product not available) (section 9.6.2) should be given prophylactically from the start of treatment. Other side-effects such as hepatitis (important: see Monitoring above) and psychosis are rare.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months (‘initial phase’) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease (important: see Monitoring above). On intermittent treatment six toxicity syndromes have been recognised—fever, malaise, abdominal, respiratory symptoms, sepsis, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients. Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulfonylureas, and anticoagulants; **interactions:** Appendix 1 (rifamycins). **Important:** the effectiveness of hormonal contraceptives is
Capreomycin

**Indications** in combination with other drugs, tuberculosis resistant to first-line drugs

**Cautions** monitor haematological, renal, and hepatic function; **interactions**: Appendix 1 (cycloserine)

**Contra-indications** epilepsy, depression, severe anxiety, psychotic states, alcohol dependence, acute porphyria (section 9.8.2)

**Renal impairment** reduce dose and monitor blood-cycloserine concentration; avoid in severe impairment

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—teratogenic in animal studies

**Breast-feeding** amount too small to be harmful

**Side-effects** mainly neurological, including headache, dizziness, vertigo, drowsiness, tremor, convulsions, confusion, psychosis, depression (discontinue or reduce dose if symptoms of CNS toxicity); rashes, allergic dermatitis (discontinue or reduce dose); megaloblastic anaemia; changes in liver function tests; heart failure at high doses reported

**Dose**
- Initially 250 mg every 12 hours for 2 weeks increased according to blood concentration and response to max. 500 mg every 12 hours; **CHILD 2–18 years** see BNF for Children

**Note** Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre

**Cycloserine** (King) 58

**Capsules** red/grey cycloserine 250 mg, net price 100-cap pack = £33.80. Label: 2, 8

**ETHAMBUTOL HYDROCHLORIDE**

**Indications** tuberculosis, in combination with other drugs

**Cautions** elderly; test visual acuity before treatment and warn patients to report visual changes—see Monitoring in notes above; young children (see notes above)—routine ophthalmological monitoring recommended
Contra-indications optic neuritis, poor vision

Renal impairment reduce dose; if creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration; optic nerve damage

Pregnancy not known to be harmful; see also p. 361

Breast-feeding amount too small to be harmful; see also p. 361

Side-effects optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urticaria, thrombocytopenia

Dose

- See notes above

Note 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre). See Cautions above, for advice on laboratory assay of ethambutol contact the Poisons Unit at New Cross Hospital (Tel (020) 7771 5360)

Ethambutol (Non-proprietary)

Tablets, ethambutol hydrochloride 100 mg, net price 56-tab pack = £12.00; 400 mg, 56-tab pack = £44.18. Label: 8

ISONIAZID

Indications tuberculosis, in combination with other drugs; prophylaxis—Table 2, section 5.1

Cautions see Monitoring in notes above; also slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); acute porphyria (section 9.8.2); interactions: Appendix 1 (isoniazid)

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Contra-indications drug-induced liver disease

Hepatic impairment use with caution; monitor liver function regularly and particularly frequently in first 2 months; see also Hepatic Disorders above

Renal impairment max. 200 mg daily if eGFR less than 10 mL/minute/1.73 m²; peripheral neuropathy

Pregnancy not known to be harmful; see also p. 361

Breast-feeding monitor infant for possible toxicity; theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother and infant; see also p. 361

Side-effects nausea, vomiting, constipation, dry mouth; peripheral neuritis with high doses (pyridoxine prophylaxis, see notes above), optic neuritis, convulsions, psychotic episodes, vertigo; hypersensitivity reactions including fever, Stevens-Johnson syndrome, purpura; blood disorders including agranulocytosis, haemolytic anaemia, aplastic anaemia; hepatitis (especially over age of 35 years); pancreatitis; interstitial pneumonia; systemic lupus erythematosus-like syndrome, pellagra, hyperreflexia, difficulty with micturition, hyperglycaemia, and gynaecomastia reported; hearing loss and tinnitus (in patients with end-stage renal impairment); when used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating also reported

Dose

- By mouth or by intramuscular or intravenous injec-

ion, see notes above

Isoniazid (Non-proprietary)

Tablets, isoniazid 50 mg, net price 56-tab pack = £11.10; 100 mg, 28-tab pack = £11.30. Label: 8, 22

Elixir (BPC), isoniazid 50 mg, citric acid monohydrate 12.5 mg, sodium citrate 60 mg, concentrated anise water 0.05 mL, compound tartrazine solution 0.05 mL, glycerol 1 mL, double-strength chloroform water 2 mL, water to 5 mL. Label: 8, 22

Available from 'special-order' manufacturers or specialist importing companies, see p. 988

Injection, isoniazid 25 mg/mL, net price 2-mL amp = £11.04

PYRAZINAMIDE

Indications tuberculosis in combination with other drugs (unlicensed)

Cautions see Monitoring in notes above; also diabetes; gout (avoid in acute attack); interactions: Appendix 1 (pyrazinamide)

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment monitor hepatic function—idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment; see also Hepatic Disorders above

Pregnancy manufacturer advises use only if potential benefit outweighs risk; see also p. 361

Breast-feeding amount too small to be harmful; see also p. 361

Side-effects hepatotoxicity including fever, anorexia, hepatomegaly, splenomegaly, jaundice, liver failure; nausea, vomiting, flushing, dysuria, arthralgia, sideroblastic anaemia, thrombocytopenia, rash and occasionally photosensitivity

Dose

- See notes above

Pyrazinamide (Non-proprietary)

Tablets, scored, pyrazinamide 500 mg. Label: 8 Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

RIFABUTIN

Indications see under Dose

Cautions see under Rifampicin; acute porphyria (section 9.8.2)

Hepatic impairment reduce dose in severe impair-

ment

Renal impairment use half normal dose if eGFR less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting; leucopenia, thrombocytopenia, anaemia, rarely haemolytic; raised liver enzymes, jaundice, rarely hepatitis; uraemia following high doses or administration with drugs which raise plasma concentration—see also interactions: Appendix 1 (rifampicins); arthralgia, myalgia, influenza-like syndrome, dyspnoea; also hypersensitivity reactions including fever, rash, eosinophilia, bron-
5.1.9 Antituberculosis drugs

**Dosage**

- **Prophylaxis of Mycobacterium avium complex infections** in immunosuppressed patients with low CD4 count (see product literature), 300 mg daily as a single dose.

- **Treatment of non-tuberculous mycobacterial disease**, in combination with other drugs, 450–600 mg daily as a single dose for up to 6 months after cultures negative.

- **Treatment of pulmonary tuberculosis**, in combination with other drugs, 150–450 mg daily as a single dose for at least 6 months.

**Cautions**

- **Side-effects**
  - amount too small to be harmful; see Monitoring in notes above; also liver function tests and blood counts in hepatic disorders, alcohol dependence, and on prolonged therapy (see also below); acute porphyria (section 9.8.2); important: advise patients on hormonal contraceptives to use additional means (see also section 7.3.1); disclours soft contact lenses; see also notes above; interactions: Appendix 1 (rifamycins).

- **Note**: If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop.

- **Hepatic disorders**: Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

- **Contra-indications**: jaundice.

- **Hepatic impairment**: impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily; see also Cautions above.

- **Renal impairment**: use with caution if dose above 600 mg daily.

- **Pregnancy**: manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester; see also p. 361.

- **Breast-feeding**: amount too small to be harmful; see also p. 361.

- **Side-effects**: gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice; flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pempigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva, and other body secretions coloured orange-red; thrombophlebitis reported if infusion used for prolonged period.

**Dose**

- **Brucellosis, legionnaires’ disease, endocarditis and serious staphylococcal infections**, in combination with other drugs, **by mouth or by intravenous infusion**, 0.6–1.2 g daily (in 2–4 divided doses).

- **Tuberculosis**, in combination with other drugs, see notes above.

- **Leprosy, section 5.1.10**.

- **Prophylaxis of meningococcal menigitis and Haemophilus influenzae (type b) infection, section 5.1, table 2.**

**Rifampicin**

**Indications**: see under Dose

**Cautions**: see Monitoring in notes above; also liver function tests and blood counts in hepatic disorders, alcohol dependence, and on prolonged therapy, see also below; acute porphyria (section 9.8.2).

**Note**: If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop.

**Hepatic disorders**: Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**Contra-indications**: jaundice.

**Hepatic impairment**: impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily; see also Cautions above.

**Renal impairment**: use with caution if dose above 600 mg daily.

**Pregnancy**: manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester; see also p. 361.

**Breast-feeding**: amount too small to be harmful; see also p. 361.

**Side-effects**: gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice; flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pempigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva, and other body secretions coloured orange-red; thrombophlebitis reported if infusion used for prolonged period.

**Dose**

- **Brucellosis, legionnaires’ disease, endocarditis and serious staphylococcal infections**, in combination with other drugs, **by mouth or by intravenous infusion**, 0.6–1.2 g daily (in 2–4 divided doses).

- **Tuberculosis**, in combination with other drugs, see notes above.

- **Leprosy, section 5.1.10**.

- **Prophylaxis of meningococcal menigitis and Haemophilus influenzae (type b) infection, section 5.1, table 2.**

**Rifampicin**

**Indications**: see under Dose

**Cautions**: see Monitoring in notes above; also liver function tests and blood counts in hepatic disorders, alcohol dependence, and on prolonged therapy, see also below; acute porphyria (section 9.8.2).

**Note**: If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop.

**Hepatic disorders**: Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**Contra-indications**: jaundice.

**Hepatic impairment**: impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily; see also Cautions above.

**Renal impairment**: use with caution if dose above 600 mg daily.

**Pregnancy**: manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester; see also p. 361.

**Breast-feeding**: amount too small to be harmful; see also p. 361.

**Side-effects**: gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice; flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pempigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva, and other body secretions coloured orange-red; thrombophlebitis reported if infusion used for prolonged period.

**Dose**

- **Brucellosis, legionnaires’ disease, endocarditis and serious staphylococcal infections**, in combination with other drugs, **by mouth or by intravenous infusion**, 0.6–1.2 g daily (in 2–4 divided doses).

- **Tuberculosis**, in combination with other drugs, see notes above.

- **Leprosy, section 5.1.10**.

- **Prophylaxis of meningococcal menigitis and Haemophilus influenzae (type b) infection, section 5.1, table 2.**
Renal impairment see under Aminoglycosides, section 5.1.4
Pregnancy see under Aminoglycosides, section 5.1.4
Side-effects see under Aminoglycosides, section 5.1.4; also hypersensitivity reactions, paraesthesia of mouth

Dose

- By deep intramuscular injection, tuberculosis [unlicensed], see notes above; brucellosis, expert advice essential

Note One-hour (‘peak’) concentration should be 15–40 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years)

Streptomycin Sulphate (Non-proprietary) [full]
Injection, powder for reconstitution, streptomycin (as sulphate), net price 1-g vial = £8.25
Available as an unlicensed preparation from UCB Pharma

366 5.1.10 Antileprotic drugs

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen’s disease). Details of the Panel can be obtained from the Department of Health telephone (020) 7972 4480.

The World Health Organization has made recommendations to overcome the problem of dapsone resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin (section 5.1.9), and clofazimine. Other drugs with significant activity against Mycobacterium leprae include ofloxacin, minocycline and clarithromycin, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for multibacillary leprosy (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for paucibacillary leprosy (borderline-tuberculoid, tuberculoid, and paucibacillary). The following regimens are widely used throughout the world (with minor local variations):

Multibacillary leprosy (3-drug regimen)

- Rifampicin 600 mg once-monthly, supervised (450 mg for adults weighing less than 35 kg)
- Dapsone 100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)
- Clofazimine 300 mg once-monthly, supervised, and 50 mg daily (or 100 mg on alternate days), self-administered

Multibacillary leprosy should be treated for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone (initially 40–60 mg daily) should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide (unlicensed) is also useful in men and post-menopausal women who have become corticosteroid dependent, but it should be used under specialist supervision and it should never be used in women of child-bearing potential (significant teratogenic risk—for CSM guidance on prescribing, see Current Problems in Pharmacovigilance 1994; 20, 8). Increased doses of clofazimine 100 mg 3 times daily for the first month with subsequent reductions, are also useful but may take 4–6 weeks to attain full effect.

Paucibacillary leprosy (2-drug regimen)

- Rifampicin 600 mg once-monthly, supervised (450 mg for those weighing less than 35 kg)
- Dapsone 100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)

Paucibacillary leprosy should be treated for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary anti-leprosy regimen is sufficient to treat tuberculosis.

DAPSONE

Indications leprosy, dermatitis herpetiformis; Pneumocystis jirovecii (Pneumocystis carinii) pneumonia (section 5.4.8)

Cautions cardiac or pulmonary disease; anaemia (treat severe anaemia before starting); susceptibility to haemolysis including G6PD deficiency (section 9.1.5); avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (dapsone)

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

Pregnancy folic acid 5 mg daily should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinemia reported in third trimester

Breast-feeding haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient

Side-effects (dose-related and uncommon at doses used for leprosy), haemolytic anaemia, methaemoglobinemia, neutropathy, allergic dermatitis (rarely including toxic epidermal necrolysis and Stevens-Johnson syndrome), anorexia, nausea, vomiting, tachycardia, headache, insomnia, psychosis, hepatitis, agranulocytosis; dapsone syndrome (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoaalbuminaemia, psychosis and death)

Dose

- Leprosy. 1–2 mg/kg daily, see notes above
- Dermatitis herpetiformis, see specialist literature

Dapsone (Non-proprietary) [full]
Tablets, dapsone 50 mg, net price 28-tab pack = £32.53; 100 mg, 28-tab pack = £47.44 Label: 8

CLOFAZIMINE

Indications leprosy

Cautions may discolor soft contact lenses; avoid if persistent abdominal pain and diarrhoea

Hepatic impairment use with caution

Renal impairment use with caution
BNF 61

5.1.11 Metronidazole and tinidazole

Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; indications include trichomonal vaginitis (section 5.4.3), bacterial vaginosis (notably Gardnerella vaginalis infections), and Entamoeba histolytica infections (section 13.6). It is also used for surgical and gynaecological sepsis in which its activity against colonic anaerobes, especially Bacteroides fragilis, is important. Metronidazole by rectal route is an effective alternative to the intravenous route when oral administration is not possible. Intravenous metronidazole is used for the treatment of established cases of tetanus; diazepam (section 10.2.2) and tetanus immunoglobulin (section 13.5.2) are also used.

Metronidazole by mouth is effective for the treatment of Clostridium difficile infection, see also section 1.5; it can be given by intravenous infusion if oral treatment is inappropriate.

Topical metronidazole (section 13.10.1.2) reduces the odour produced by anaerobic bacteria in fungating tumours; it is also used in the management of rosacea (section 13.6).

Tinidazole is similar to metronidazole but has a longer duration of action.

Oral infections Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes (Table 1, section 5.1). It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and periodontitis; suitable alternatives are amoxicillin (section 5.1.1.3) and erythromycin (section 5.1.5).

For these purposes metronidazole in a dose of 200 mg 3 times daily for 3 days is sufficient, but the duration of treatment may need to be longer in periconditis. Tinidazole is licensed for the treatment of acute ulcerative gingivitis.

Indications anaerobic infections (including dental), see under Dose below; protozoal infections (section 5.4.2); Helicobacter pylori eradication (section 1.3); skin (section 13.10.1.2)

Cautions disulfiram-like reaction with alcohol; avoid in acute porphyria (section 9.8.2); clinical and laboratory monitoring advised if treatment exceeds 10 days; interactions: Appendix 1 (metronidazole)

Hepatic impairment in severe liver disease reduce total daily dose to one-third, and give once daily; use with caution in hepatic encephalopathy

Pregnancy manufacturer advises avoidance of high-dose regimens

Breast-feeding significant amount in milk; manufacturer advises avoid large single doses

Side-effects gastro-intestinal disturbances (including nausea and vomiting), taste disturbances, furred tongue, oral mucositis, anorexia; very rarely hepatitis, jaundice, pancreatitis, drowsiness, dizziness, headache, ataxia, psychotic disorders, darkening of urine, thrombocytopenia, pancytopenia, myalgia, arthralgia, visual disturbances, rash, pruritus, and erythema multiforme; on prolonged or intensive therapy peripheral neuropathy, transient epileptiform seizures, and leucopenia

Dose

• Anaerobic infections (usually treated for 7 days and for 10–14 days in Clostridium difficile infection), by mouth, either 400 mg every 8 hours or 500 mg every 8 hours, CHILD 1 month–12 years 7.5 mg/kg (max. 400 mg) every 8 hours; by rectum, 1 g every 8 hours for 3 days, then 1 g every 12 hours, CHILD every 8 hours for 3 days, then every 12 hours, 1 month–1 year 125 mg, 1–5 years 250 mg, 5–10 years 500 mg, over 10 years, adult dose; by intravenous infusion over 20 minutes, 500 mg every 8 hours; CHILD 7.5 mg/kg (max. 500 mg) every 8 hours

• Leg ulcers and pressure sores, by mouth, 400 mg every 8 hours for 7 days

• Bacterial vaginosis, by mouth, 400–500 mg twice daily for 5–7 days or 2 g as a single dose

• Pelvic inflammatory disease (see also Table 1, section 5.1), by mouth, 400 mg twice daily for 14 days

• Acute ulcerative gingivitis, by mouth, 200–250 mg every 8 hours for 3 days; CHILD 1–3 years 50 mg every 8 hours for 3 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours

• Acute oral infections, by mouth, 200 mg every 8 hours for 3–7 days (see also notes above); CHILD 1–3 years 50 mg every 8 hours for 3–7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours

• Surgical prophylaxis, by mouth, 400–500 mg 2 hours before surgery; up to 3 further doses of 400–500 mg may be given every 8 hours for high-risk procedures; CHILD 1 month–12 years 7.5 mg/kg (max. 400 mg) 2 hours before surgery; up to 3 further doses of 7.5 mg/kg may be given every 8 hours for high-risk procedures

By rectum, 1 g 2 hours before surgery; up to 3 further doses of 1 g may be given every 8 hours for high-risk procedures; CHILD 5–10 years 500 mg 2 hours before surgery; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures

By intravenous infusion (if rectal administration inappropriate), 500 mg up to 30 minutes before the
Infections

**Bacterial vaginosis and acute ulcerative gingivitis**, a.

Fasigyn.

Anaerobic infections, 2 g initially, followed by 1 g daily

**Dose**

**Side-effects**

Breast-feeding

present in milk—manufacturer advises avoid in first trimester.

**Cautions** see under Metronidazole; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (tinidazole).

**Pregnancy** manufacturer advises avoid in first trimester.

**Breast-feeding** present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment

**Side-effects** see under Metronidazole

### Dose

- Anaerobic infections, 2 g initially, followed by 1 g daily or 500 mg twice daily; usually for 5–6 days
- Bacterial vaginosis and acute ulcerative gingivitis, a single 2-g dose
- Abdominal surgery prophylaxis, a single 2-g dose approximately 12 hours before surgery

Fasigyn® (Pfizer)®

Tablets, f/c, tinidazole 500 mg. Net price 16-tab pack = £11.04. Label: 4, 9, 21, 25

**Note** Metronidazole doses in BNF may differ from those in product literature

### Metronidazole

**Non-proprietary**

Tablets, metronidazole 200 mg, net price 21-tab pack = £1.36; 400 mg, 21-tab pack = £1.35. Label: 4, 9, 21, 25

**Brands** include Vagopy®

**Dental prescribing on NHS** Metronidazole Tablets may be prescribed

Tablets, metronidazole 500 mg, net price 21-tab pack = £29.84. Label: 4, 9, 21, 25

**Dental prescribing on NHS** Metronidazole Tablets may be prescribed

Suspension, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £11.43. Label: 4, 9

**Brands** include Noraz®

**Dental prescribing on NHS** Metronidazole Oral Suspension may be prescribed

**Intravenous infusion**, metronidazole 5 mg/mL. Net price 20-mL amp = £1.56, 100-mL container = £3.41

Flagyl® (Winthrop)®

Tablets, both f/c, ivory, metronidazole 200 mg, net price 21-tab pack = £4.49; 400 mg, 14-tab pack = £6.34. Label: 4, 9, 21, 25

Suppositories, metronidazole 500 mg, net price 10 = £15.18; 1 g, 10 = £23.06. Label: 4, 9

Flagyl® S® (Winthrop)®

Suspension, orange- and lemon-flavoured, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £11.18. Label: 4, 9

Metrolyl® (Sandoz)®

Intravenous infusion, metronidazole 5 mg/mL, net price 100-mL Steriflex® bag = £1.22

Electrolytes Na+ 14.53 mmol/100-mL bag

Suppositories, metronidazole 500 mg, net price 10 = £12.34; 1 g, 10 = £18.34. Label: 4, 9

**TINIDAZOLE**

**Indications** anaerobic infections, see under Dose below; protozoal infections (section 5.4.2); Helicobacter pylori eradication (section 1.3)

**Cautions** see under Metronidazole; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (tinidazole).

**Pregnancy** manufacturer advises avoid in first trimester.

**Breast-feeding** present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment

**Side-effects** see under Metronidazole

- Anaerobic infections, 2 g initially, followed by 1 g daily or 500 mg twice daily; usually for 5–6 days
- Bacterial vaginosis and acute ulcerative gingivitis, a single 2-g dose

Fasigyn® (Pfizer)®

Tablets, f/c, tinidazole 500 mg. Net price 16-tab pack = £11.04. Label: 4, 9, 21, 25

**Nalidixic acid and norfloxacin** are effective in uncomplicated urinary-tract infections.

**Ciprofloxacin** is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as Streptococcus pneumoniae and Enterococcus faecalis; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicemia caused by sensitive organisms.

**Floxacin** is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

**Levofloxacin** is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for community-acquired pneumonia but it is considered to be second-line treatment for this indication. Although ciprofloxacin, levofloxacin, moxifloxacin, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

**Moxifloxacin** should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against Pseudomonas aeruginosa or meticillin-resistant Staphylococcus aureus (MRSA).

**Anthrax** Inhaling or gastro-intestinal anthrax should be treated initially with either ciprofloxacin [not licensed for gastro-intestinal anthrax] or doxycycline [unlicensed indication] (section 5.1.3) combined with one or two other antibacterials [such as amoxicillin, benzylpenicillin, chloramphenicol, clarithromycin, clindamycin, imipenem with cilastatin, rifampicin [unlicensed indication], and vancomycin]. When the condition improves and the sensitivity of the Bacillus anthracis strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

**Cutaneous anthrax** should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] (section 5.1.3) for 7 days. Treatment may be switched to amoxicillin (section 5.1.1.3) if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for post-exposure prophylaxis. If exposure is confirmed, anti-
bacterial prophylaxis should continue for 60 days. Antibi-

teractive: Appendix 1 (quinolones).

Cautions Quinolones should be used with caution in patients with a history of epilepsy or conditions that predispose to seizures, in G6PD deficiency (section 9.1.5), myasthenia gravis (risk of exacerbation), and in children or adolescents (arthropathy has developed in predispose to seizures, in G6PD deficiency (section 9.1.5), myasthenia gravis (risk of exacerbation), and in children or adolescents (arthropathy has developed in young animals—see below). Exposure to excessive sunlight should be avoided (dis-

Tendon damage Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of start-

ting treatment; cases have also been reported several months after stopping a quinolone. Healthcare pro-

Ciprofloxacin (Non-proprietary) Tablets, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £1.42; 250 mg, 10-tab pack = £0.96, 20-

Ciprofloxacin® (Bayer Schering) Tablets, all f/c, ciprofloxacin (as hydrochloride) 250 mg (scored), 10-tab pack = £8.59; 500 mg (scored), 10-tab pack = £12.49; 750 mg, 10-tab pack = £17.78. Label: 7, 9, 25, counselling, driving

Suspension, strawberry-flavoured, ciprofloxacin for reconstitution with diluent provided, 250 mg/5 mL,
Levofoxacin

**Indications**

see under Dose

**Cautions**

see notes above; predisposition to QT interval prolongation (including cardiac disease, congenital long QT syndrome, electrolyte disturbances, concomitant use with other drugs known to prolong QT interval); history of psychiatric illness; **interactions**: Appendix 1 (quinolones)

**Driving**

May impair performance of skilled tasks (e.g. driving)

**Contra-indications**

see notes above

**Renal impairment**

usual initial dose then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; consult product literature if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy**

see notes above

**Breast-feeding**

manufacturer advises avoidance

**Side-effects**

see notes above; also reported toxic hepatitis, peripheral neuropathy, and hypoglycaemia; also reported, rhabdomyolysis and potentially life-threatening hepatic failure; local reactions and transient hypotension reported with infusion

**Dose**

- **By mouth**, acute sinusitis, 500 mg daily for 10–14 days

  Exacerbation of chronic bronchitis, 250–500 mg daily for 7–10 days

  Community-acquired pneumonia, 500 mg once or twice daily for 7–14 days

  Urinary-tract infections, 250 mg daily for 7–10 days

  (for 3 days in uncomplicated infection)

  Chronic prostatitis, 500 mg once daily for 28 days

  Skin and soft tissue infections, 250 mg daily or 500 mg once or twice daily for 7–14 days

- **By intravenous infusion** (over at least 60 minutes for 500 mg), community-acquired pneumonia, 500 mg once or twice daily for 7–14 days

  Complicated urinary-tract infections, 250 mg daily, increased in severe infections

  Skin and soft tissue infections, 500 mg twice daily

**Tavanic**® (Sanofi-Aventis) (BNF for Children)

Tablets, yellow-red, 1/2, scored, levofloxacin 250 mg, net price 5-tab pack = £16.83. Label: 1, 2, 15, counselling

**Intravenous infusion**, levofloxacin 5 mg/mL, net price 100-mL bottle = £26.40

Electrolytes Na⁺ 15.4 mmol/100-mL bottle

**Contra-indications**

see notes above; history of QT-interval prolongation, bradycardia, history of symptomatic arrhythmias, heart failure with reduced left ventricular ejection fraction, electrolyte disturbances, concomitant use with other drugs known to prolong QT-interval

**Hepatic impairment**

manufacturer advises avoid in severe impairment

**Pregnancy**

see notes above

**Breast-feeding**

manufacturer advises avoid—present in milk in animal studies

**Side-effects**

see notes above; also gastritis, flatulence, constipation, arrhythmias, palpitation, angina, vasodilatation, hyperlipidaemia, and sweating; rarely oedema, hypertension, syncope, dysphagia, abnormal dreams, incoordination, amnesia, hyperglycaemia, hyperuricaemia, and stomatitis; very rarely rhabdomyolysis and potentially life-threatening hepatic failure; on intravenous infusion, pain and phlebitis at injection site

**Dose**

- **By mouth**, 400 mg once daily

- **By intravenous infusion** over 60 minutes, community-acquired pneumonia, complicated skin and soft-tissue infections, 400 mg once daily

**Note**

Recommended duration of treatment is 7–14 days for community-acquired pneumonia, 5–10 days in exacerbations of chronic bronchitis, 7 days in sinusitis, 7–21 days for complicated skin and soft-tissue infections

**Avelox**® (Bayer Schering) (BNF 61)

Tablets, red, 1/2, c. moxifloxacin (as hydrochloride) 400 mg, net price 5-tab pack = £12.45. Label: 6, 9, 25, counselling, driving

**Intravenous infusion**, moxifloxacin (as hydrochloride) 1.6 mg/mL, net price 250-mL bottle (400 mg) = £39.95

Electrolytes Na⁺ 34 mmol/250-mL bottle

**Nalidixic Acid**

**Indications**

urinary-tract infections

**Cautions**

see notes above; avoid in acute porphyria (section 9.2.2); false positive urinary glucose (if tested for reducing substances); monitor blood counts, renal and liver function if treatment exceeds 2 weeks; **interactions**: Appendix 1 (quinolones)

**Contra-indications**

see notes above

**Hepatic impairment**

manufacturer advises caution in liver disease

**Renal impairment**

use with caution; avoid if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy**

see notes above

**Breast-feeding**

risk to infant very small but one case of haemolytic anaemia reported

**Side-effects**

see notes above; also reported toxic psychosis, increased intracranial pressure, cranial nerve palsy, peripheral neuropathy, and metabolic acidosis

**Dose**

- 900 mg every 6 hours for 7 days, reduced in chronic infections to 600 mg every 6 hours; **CHILD** 3 months–18 years see **BNF for Children**

Nalidixic Acid (Roemmet) (BNF 61)

Suspension, pink, nalidixic acid 300 mg/5 mL, net price 150 mL (raspberry- and strawberry-flavoured) = £12.50. Label: 9, 11

Excipients include sorcrose 450 mg/5 mL
NORFLOXACIN

Indications  see under Dose
Cautions  see notes above; Interactions: Appendix 1 (quinolones)

Driving  May impair performance of skilled tasks (e.g. driving)

Contra-indications  see notes above

Renal impairment  use 400 mg once daily if eGFR less than 30 mL/minute/1.73 m²

Breast-feeding  see notes above

Side-effects  see notes above; also tinnitus, epiphora; rarely pancreatitis; very rarely arrhythmias; also reported, polyneuropathy and exfoliative dermatitis

Dose  • ‘Lower’ urinary-tract infections, 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)
  • Chronic relapsing ‘lower’ urinary-tract infections, 400 mg twice daily for up to 12 weeks; may be reduced to 400 mg once daily if adequate suppression within first 4 weeks
  • Chronic prostatitis, 400 mg twice daily for 28 days

Norfloxacin  (Non-proprietary) [A]

Tablets  norfloxacin 400 mg, net price 6-tab pack = £2.30, 14-tab pack = £6.20. Label: 7, 9, 23, counselling, driving

Utinor®  (MSD) [A]

Tablets  scored, norfloxacin 400 mg. Net price 7-tab pack = £2.56, 14-tab pack = £5.11. Label: 7, 9, 23, counselling, driving

OFLOXACIN

Indications  see under Dose
Cautions  see notes above; history of psychiatric illness; Interactions: Appendix 1 (quinolones)

Driving  May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol

Contra-indications  see notes above

Hepatic impairment  use with caution; elimination may be reduced in severe impairment

Renal impairment  usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m²

Pregnancy  see notes above

Breast-feeding  amount probably too small to be harmful but manufacturer advises avoid

Side-effects  see notes above; also eye irritation; rarely arrhythmias, abnormal dreams, hot flushes, hyperhidrosis; very rarely neuropathy, extrapyramidal symptoms; also reported pneumonitis, changes in blood sugar, myopathy, rhabdomyolysis; on intravenous infusion, hypotension and local reactions (including thrombophlebitis)

Dose  • By mouth, urinary-tract infections, 200–400 mg daily preferably in the morning, increased if necessary in upper urinary-tract infections to 400 mg twice daily
  • Acute or chronic prostatitis, 200 mg twice daily for 28 days

Skin and soft-tissue infections, 400 mg twice daily

Pelvic inflammatory disease (see also section 5.1, table 1), 400 mg twice daily for 14 days

By intravenous infusion (over at least 30 minutes for each 200 mg), complicated urinary-tract infection, 200 mg daily

Lower respiratory-tract infection, 200 mg twice daily

Skin and soft-tissue infections, 400 mg twice daily

Severe or complicated infections, dose may be increased to 400 mg twice daily

Ofloxacin  (Non-proprietary) [A]

Tablets  ofloxacin 200 mg, net price 10-tab pack = £8.29; 400 mg, 5-tab pack = £5.71, 10-tab pack = £5.52. Label: 6, 9, 11, counselling, driving

Tarivid®  (Sanofi-Aventis) [A]

Tablets, f/c, scored, ofloxacin 200 mg, net price 10-tab pack = £7.53, 20-tab pack = £15.05; 400 mg (yellow), 5-tab pack = £7.52, 10-tab pack = £14.99. Label: 6, 9, 11, counselling, driving

Intravenous infusion, ofloxacin (as hydrochloride) 2 mg/mL, net price 100-mL bottle = £16.16 (hosp. only)

5.1.13 Urinary-tract infections

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage. Escherichia coli is the most common cause of urinary-tract infection; Staphylococcus saprophyticus is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. Pseudomonas aeruginosa infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. Staphylococcus epidermidis and Enterococcus faecalis infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy:
  • in men;
  • in pregnant women;
  • in children under 3 years of age;
  • in patients with suspected upper urinary-tract infection, complicated infection, or recurrent infection;
  • if resistant organisms are suspected;
  • if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
  • if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Uncomplicated gonorrhoea, 400 mg as a single dose

Uncomplicated genital chlamydial infection, non-gonococcal urethritis, 400 mg daily in single or divided doses for 7 days

Pelvic inflammatory disease (see also section 5.1, table 1), 400 mg twice daily for 14 days

Uncomplicated lower urinary-tract infections often respond to trimethoprim, nitrofurantoin, amoxicillin, or nalidixic acid given for 7 days (3 days may be
5 Infections

During pregnancy; trimethoprim should also preferably be used but it should be avoided at term. Sulfonamides, quinolones, and tetracyclines should be avoided; nitrofurantoin should be avoided altogether. Acute pyelonephritis may lead to sepsis and is treated initially by injection of a broad-spectrum antibacterial such as ceftriaxone or a quinolone if the patient is severely ill; gentamicin can also be used. Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as trimethoprim, or some quinolones. Where infection is localised and associated with an indwelling catheter a bladder instillation is often effective (section 7.4.4).

Pregnancy

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides, quinolones, and tetracyclines should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment

In renal failure antibacterials nor- mally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine, and nitrofurantoin should be avoided altogether.

Children

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated ‘lower’ urinary-tract infections in children over 3 months of age can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it. Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous anti-bacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period. Recurrent episodes of infection are an indication for imaging tests. Antibacterial prophylaxis with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

### NITROFURANTOIN

**Indications** urinary-tract infections

**Cautions** anaemia; diabetes mellitus; electrolyte imbalance; vitamin B and folate deficiency; pulmonary disease; on long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function); susceptibility to peripheral neuropathy; false positive urinary glucose (if tested for reducing substances); urine may be coloured yellow or brown; interactions: Appendix 1 (nitrofurantoin)

**Contra-indications** infants less than 3 months old, G6PD deficiency (section 9.1.5); acute porphyria (section 9.8.2)

**Hepatic impairment** use with caution; cholestatic jaundice and chronic active hepatitis reported

**Renal impairment** avoid if eGFR less than 60 mL/minute/1.73 m²; risk of peripheral neuropathy; ineffective because of inadequate urine concentrations

**Pregnancy** avoid at term—may produce neonatal haemolysis

**Breast-feeding** avoid; only small amounts in milk but could be enough to produce haemolysis in G6PD-deficient infants (section 9.1.5)

**Side-effects** anorexia, nausea, vomiting, and diarrhoea; acute and chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome); peripheral neuropathy; also reported, hypersensitivity reactions (including angioedema, anaphylaxis, sialadenitis, urticaria, rash and pruritus); rarely, cholestatic jaundice, hepatitis, exfoliative dermatitis, erythema multiforme, pancreatitis, arthralgia, blood disorders (including agranulocytosis, thrombocytopenia, and aplastic anaemia), benign intracranial hypertension, and transient alopecia

**Dose**

- Acute uncomplicated infection, 50 mg every 6 hours with food for 7 days (3 days usually adequate in women); CHILD over 3 months, 3 mg/kg daily in 4 divided doses
- Severe chronic recurrent infection, 100 mg every 6 hours with food for 7 days (dose reduced or discontinued if severe nausea)
- Prophylaxis (but see Cautions), 50–100 mg at night; CHILD over 3 months, 1 mg/kg at night

**Nitrofurantoin (Non-proprietary)**

**Tablets** nitrofurantoin 50 mg, net price 28-tab pack = £1.84; 100 mg, 28-tab pack = £4.43. Label: 9, 14, 21

**Oral suspension** nitrofurantoin 25 mg/5 mL, net price 300 mL = £99.05. Label: 9, 14, 21

**Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription.
Aspergillosis

Aspergillosis most commonly affects section 13.10.2 (skin), section 12.1.1 (ear), section 12.3.2 (oropharynx), and (genital), section 7.4.4 (bladder), section 11.3.2 (eye), local treatment of fungal infections, see section 7.2.2 forms of systemic or disseminated fungal infections. For outlined below; specialist treatment is required in most

The systemic treatment of common fungal infections is

Treatment of fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. For local treatment of fungal infections, see section 7.2.2 (genital), section 7.4.4 (bladder), section 11.3.2 (eye), section 12.1.1 (ear), section 12.3.2 (oropharynx), and section 13.10.2 (skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole (section 5.2.1) is the treatment of choice for aspergillosis; liposomal amphotericin (section 5.2.3) is an alternative first-line treatment when voriconazole cannot be used. Caspo-

5.2 Antifungal drugs

Furadantin® (Goldshield) Tablets, all yellow, scored, nitrofurantoin 50 mg, net price 100-tab pack = £9.79; 100 mg, 100-tab pack = £18.11. Label: 9, 14, 21

Macrobid® (Goldshield) Capsules, yellow/white, nitrofurantoin 100 mg (as macrocrystals), yellow/white, 30-cap pack = £4.81. Label: 9, 14, 21

Modified release

Macrobid® (Goldshield) Capsules, m/r, blue/yellow, nitrofurantoin 100 mg (as nitrofurantoin macrocrystals and nitrofurantoin monohydrate), net price 14-cap pack = £4.89. Label: 9, 14, 21, 25

Dose uncomplicated urinary-tract infection, 1 capsule twice daily with food

Genito-urinary surgical prophylaxis, 1 capsule twice on day of procedure and for 3 days after

METHENAMINE HIPPURATE (Hexamine hippurate)

Indications prophylaxis and long-term treatment of chronic or recurrent lower urinary-tract infections

Cautions avoid concurrent administration with sulfonamides (risk of crystalluria) or urinary alkalinising agents; interactions: Appendix 1 (methenamine)

Contra-indications severe dehydration, gout, metabolic acidosis

Hepatic impairment avoid

Renal impairment avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hippurate crystalluria

Pregnancy use with caution

Breast-feeding amount too small to be harmful

Side-effects gastro-intestinal disturbances, bladder irritation, rash

Dose

• 1 g every 12 hours (may be increased in patients with catheters to 1 g every 8 hours); CHILD 6–12 years 500 mg every 12 hours

Hiprox® (Meda) Tablets, scored, methenamine hippurate 1 g, net price 60-tab pack = £6.58. Label: 9

5.2 Antifungal drugs

Candidiasis

Many superficial candidal infections including infections of the skin (section 13.10.2) are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis (section 7.2.2) may be treated with locally acting antifungals or with fluconazole (section 5.2.1) given by mouth; for resistant organisms, itraconazole (section 5.2.1) can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy (section 12.3.2); fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for fluconazole-resistant infections. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For invasive or disseminated candidiasis, an echinocandin (section 5.2.4) can be used. Fluconazole (section 5.2.1) is an alternative for Candida albicans infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin (section 5.2.3) is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole (section 5.2.1) can be used for infections caused by fluconazole-resistant Candida spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine (section 5.2.5) can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin (section 5.2.3) by intravenous infusion and flucytosine (section 5.2.5) by intravenous infusion for 2 weeks, followed by fluconazole (section 5.2.1) by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole (section 5.2.1) can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin (section 5.2.3) by intravenous infusion is preferred in patients with fulminant or severe infections. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy (section
13.10.2). Systemic therapy is appropriate if topical ther-apy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine are more used frequently than griseofulvin as they have a broader spectrum of activity and require a shorter duration of treatment. 

Tinea capitis is treated systemically; additional topical application of an antifungal (section 13.10.2) may reduce transmission. Griseofulvin (section 5.2.5) is used for tinea capitis in adults and children; it is effective against infections caused by Trichophyton tonsurans and Microsporum spp. Terbinafine (section 5.2.5) is used for tinea capitis caused by T. tonsurans [unli-censed indication]. The role of terbinafine in the manage-ment of Microsporum infections is uncertain. 

Pityriasis versicolor (section 13.10.2) may be treated with itraconazole (section 5.2.1) by mouth if topical therapy is ineffective; fluconazole (section 5.2.1) by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor. Antifungal treatment may not be necessary in asympto-matic patients with tinea infection of the nails. If treat-ment is necessary, a systemic antifungal is more effec-tive than topical therapy. Terbinafine (section 5.2.5) and itraconazole (section 5.2.1) have largely replaced griseofulvin for the systemic treatment of onycho-myocysis, particularly of the toenail; terbinafine is con-sidered to be the drug of choice. Itraconazole can be administered as intermittent ‘pulse’ therapy. For the role of topical antifungals in the treatment of onycho-myocysis, see section 13.10.2. 

Immunocompromised patients Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole (section 5.2.1) is more reliably absorbed than itraconazole (section 5.2.1), but flucona-zole is not effective against Aspergillus spp. Itracon-azole is preferred in patients at risk of invasive asper-gillosis. Posaconazole (section 5.2.1) can be used for prophylaxis in patients who are undergoing haemato-poietic stem cell transplantation or receiving chemo-therapy for acute myeloid leukaemia and myelodysplas-tic syndrome, if they are intolerant of fluconazole or itraconazole. Micafungin (section 5.2.4) can be used for prophylaxis of candidiasis in patients undergoing haemato-poietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used. 

Amphotericin (section 5.2.3) by intravenous infusion or caspofungin (section 5.2.4) is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS. 

5.2.1 Triazole antifungals 

For the role of triazole antifungal drugs in the prevention and systemic treatment of fungal infections, see p. 373. Fluconazole is very well absorbed after oral administra-tion. It also achieves good penetration into the cere-brosplinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria. 

Itraconazole is active against a wide range of derma-tophytes. Itraconazole capsules require an acid environ-ment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity. Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treat-ment. Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.
infections (including meningitis), by mouth or intravenous infusion, 400 mg on first day then 200–400 mg daily; max. 800 mg daily in severe infections [unlicensed dose]; treatment continued according to response (at least 8 weeks for cryptococcal meningitis). CHILD 6–12 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in NEONATE 2–4 weeks old); max. 800 mg daily [unlicensed dose].

- Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy, by mouth or by intravenous infusion, 200 mg daily.

- Prevention of fungal infections in immunocompromised patients, by mouth or by intravenous infusion, 50–400 mg daily adjusted according to risk; 400 mg daily if high risk of systemic infections e.g. following bone-marrow transplantation; commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range. CHILD according to extent and duration of neutropenia, 3–12 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in NEONATE 2–4 weeks old); max. 400 mg daily.

**Fluconazole** (Non-proprietary) (Non-proprietary)

Capsules, fluconazole 50 mg, net price 7-cap pack = £1.14; 150 mg, single-capsule pack = 98p; 200 mg, 7-cap pack = £5.04. Label: 9. (50 and 200 mg)

Dental prescribing on NHS Fluconazole Capsules 50 mg may be prescribed.

Intravenous infusion, fluconazole 2 mg/mL, net price 25 mL bottle = £7.31; 100 mL bottle = £29.27; 100 mL infusion bag = £27.82.

**Diflucan® (Pfizer)** (Pfizer)

Capsules, fluconazole 50 mg (blue/white), net price 7-cap pack = £1.16; 150 mg (blue), single-capsule pack = £7.12; 200 mg (purple/white), 7-cap pack = £66.42. Label: 9. (50 and 200 mg)

Oral suspension, orange-flavoured, fluconazole for reconstitution with water, 50 mg/5 mL, net price 35 mL = £16.61; 200 mg/5 mL, 35 mL = £66.42. Label: 9

Dental prescribing on NHS May be prescribed as Fluconazole Oral Suspension 50 mg/5 mL.

Intravenous infusion, fluconazole 2 mg/mL in sodium chloride intravenous infusion 0.9%, net price 25 mL bottle = £7.32; 100 mL bottle = £29.28.

**Electrolytes** Na+ 15 mmol/100 mL bottle.

---

**5.2.1 Triazole antifungals 375**

**Heart failure**

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older patients and those with cardiac disease;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

**Contra-indications**

Acute porphyria (section 9.8.2)

**Hepatic impairment**

Use only if potential benefit outweighs risk of hepatotoxicity (see Hepatotoxicity above); dose reduction may be necessary.

**Renal impairment**

Risk of congestive heart failure; bioavailability of oral formulations possibly reduced; use intravenous infusion with caution if eGFR > 80 mL/minute/1.73 m²; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m².

**Pregnancy**

Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies); ensure effective contraception during treatment and until the next menstrual period following end of treatment.

**Breast-feeding**

Small amounts present in milk—may accumulate; manufacturer advises avoid.

**Side-effects**

Nausea, abdominal pain, rash; less commonly vomiting, dyspepsia, taste disturbances, flatulence, diarrhoea, constipation, oedema, headache, dizziness, paraesthesia (discontinue treatment if neuropathy), menstrual disorder, and alopecia; rarely pancreatitis, hypoaesthesia, urinary frequency, leucopenia, visual disturbances, and tinnitus; also reported, heart failure (see Cautions above), hypertriglyceridaemia, hepatitis (see Hepatotoxicity above), erectile dysfunction, thrombocytopenia, hyponatraemia, myalgia, arthralgia, phototoxicity, toxic epidermal necrolysis, and Stevens–Johnson syndrome; with intravenous injection hypertension and hyperglycaemia.

**Dose**

- **By mouth**, oropharyngeal candidiasis, see under *Sporanox®* oral liquid below.

Vulvovaginal candidiasis, see also Recurrent Vulvovaginal Candidiasis, section 7.2.2) 200 mg twice daily for 1 day.

Pityriasis versicolor, 200 mg once daily for 7 days.

Tinea corporis and tinea cruris, either 100 mg once daily for 15 days or 200 mg once daily for 7 days.

Tinea pedis and tinea manuum, either 100 mg once daily for 30 days or 200 mg twice daily for 7 days.

Onychomycosis, either 200 mg once daily for 3 months or course (pulse) of 200 mg twice daily for 7 days, subsequent courses repeated after 21-day interval; fingernails 2 courses, toenails 3 courses.

Histoplasmosis, 200 mg 3 times daily for 3 days, then 200 mg once or twice daily.

Systemic aspergillosis, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, 200 mg once daily (candidiasis 100–200 mg once daily) increased in invasive or disseminated disease and in cryptococcal meningitis to 200 mg twice daily.
Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropaenia when standard therapy inappropriate, 200 mg once daily, increased to 200 mg twice daily if low plasma-itraconazole concentration (see Cautions) Prophylaxis in patients with haematological malignancy or undergoing bone-marrow transplant, see under Sporanox® oral liquid below

- **By intravenous infusion**, systemic aspergillosis, candidiasis and cryptocoCCOSIS including cryptocoCCAL meningitis where other antifungal drugs inappropriate or ineffective, histoplasmosis, 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days
- **CHILD** under 18 years see BNF for Children

**Note** Itraconazole doses in BNF may differ from those in product literature

**Itraconazole** (Non-proprietary)

**Capsules**, 100 mg, net price 15-cap pack = £7.21. Label: 5, 9, 21, 25, counselling, hepatotoxicity

**Sporanox®** (Janssen-Cilag)

**Capsules**, blue/pink, 100 mg, net price 4-cap pack = £5.67; 15-cap pack = £13.77; 28-cap pack (Sporanox®-Pulse) = £25.72; 60-cap pack = £55.10. Label: 5, 9, 21, 25, counselling, hepatotoxicity

**Oral liquid**, sugar-free, cherry-flavoured, 10 mg/mL, net price 150 mL (2 measuring cups) daily in 1–2 divided doses for 1 week (continue for another week if no responses)

- Fluconazole-resistant oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients, 20 mL (2 measuring cups) daily in 1–2 divided doses for 1 week (continue for another week if no responses)

- Prophylaxis of deep fungal infections (when standard therapy is inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplant. 200 mg 3 times daily in 2 divided doses; stopping before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers; CHILD and ELDERLY safety and efficacy not established

**Counselling** Do not take with food; swish around mouth and swallow, do not rinse afterwards

**Concentrate for intravenous infusion**, 10 mg/mL. For dilution before use. Net price 25-mL amp (with infusion bag and filter) = £62.58

**POSACONAゾLE**

**Indications** invasive aspergillosis; serious infections caused by Scedosporium spp., Fusarium spp., or invasive fluconazole-resistant Candida spp. (including C. krusei)

**Cautions** electrolyte disturbances, cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs known to cause QT-interval prolongation; monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy, monitor liver function; **interactions**: Appendix 1 (antifungals, triazole)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** monitor liver function; manufacturer advises caution

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk and recommends effective contraception during treatment; toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea, dyspepsia, and flatulence); dizziness, headache, paraesthesia, drowsiness, fatigue, fever, anorexia; blood disorders (including anaemia, neutropenia, and thrombocytopenia), electrolyte disturbances; dry mouth; rash; less commonly pancreatitis, hepatic disorders, arrhythmias, palpitation, changes in blood pressure, oedema, convulsions, neuropathy, tremor, hyperglycaemia, menstrual disorders, renal failure, musculoskeletal pain, visual disturbances, mouth ulcers, and alopecia; rarely ileus, cardiac failure, myocardial infarction, stroke, thrombosis, syncope, pneumonitis, psychosis, depression, encephalopathy, adrenal insufficiency, breast pain, hearing impairment, and Stevens-Johnson syndrome

**Dose**

- 400 mg twice daily with food or if food not tolerated, 200 mg 4 times daily

- Oropharyngeal candidiasis (severe infection or in immunocompromised patients only), 200 mg with food on first day, then 100 mg once daily for 13 days

- Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole, 200 mg 3 times daily with food, starting before transplantation or before chemotherapy and continued until neutrophil count recovers

- **CHILD** under 18 years not recommended

**Noxafil®** (Schering-Plough)

**Suspension**, posaconazole 200 mg/5 mL, net price 105 mL (cherry-flavoured) = £491.20. Label: 3, 9, 21

**VORICONAゾLE**

**Indications** invasive aspergillosis; serious infections caused by Scedosporium spp., Fusarium spp., or invasive fluconazole-resistant Candida spp. (including C. krusei)

**Cautions** electrolyte disturbances, cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs that prolong QT interval; avoid exposure to sunlight; patients at risk of pancreatitis; monitor liver function before treatment and during treatment; haematological malignancy (increased risk of hepatic reactions); monitor renal function; **interactions**: Appendix 1 (antifungals, triazole)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** in mild to moderate hepatic cirrhosis use usual initial dose then halve subsequent
doses; no information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk

**Renal impairment** intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required)

**Pregnancy** toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, jaundice, oedema, hypotension, chest pain, respiratory distress syndrome, sinusitis, headache, dizziness, asthma, anxiety, depression, confusion, agitation, hallucinations, paraesthesia, tremor, influenza-like symptoms, hypoglycaemia, haematuria, blood disorders (including anaemia, thrombocytopenia, leucopenia, pancytopenia), acute renal failure, hypokalaemia, visual disturbances (including altered perception, blurred vision, and photophobia), rash, pruritus, photosensitivity, alopecia, cheilitis, injection-site reactions; less commonly, dyspepsia, duodenitis, cholecystitis, pancreatitis, hepatitis, constipation, arhythmias (including QT interval prolongation), syncope, raised serum cholesterol, hypersensitivity reactions (including flushing), ataxia, nyctagmus, hypoaesthesia, adrenocortical insufficiency, arthritis, blepharitis, optic neuritis, scieritis, glossitis, gingivitis, psoriasis, Stevens-Johnson syndrome; rarely, pseudomembranous colitis, taste disturbances (more common with oral suspension), convulsions, insomnia, tinnitus, hearing disturbances, extrapyramidal effects, hypertonia, hypothyroidism, hyperthyroidism, lipoysis, pseudoporphyria, retinal haemorrhage, optic atrophy; also reported squamous cell carcinoma of skin (particularly in presence of phototoxicity or in the immunosuppressed)

**Dose**
- By mouth, ADULT and CHILD over 12 years, body-weight over 40 kg, 400 mg every 12 hours for 2 doses then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours; body-weight under 40 kg, 200 mg every 12 hours for 2 doses then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours; CHILD 2–12 years, (oral suspension recommended) 200 mg every 12 hours
- By intravenous infusion, 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours (reduced to 3 mg/kg every 12 hours if not tolerated) for max. 6 months; CHILD 2–18 years see BNF for Children

**KETOCONAZOLE**

**Indications** dermatophytoses and *Malassezia* folliculitis either resistant to fluconazole, terbinafine, or itraconazole or in patients intolerant of these antifungals; chronic mucocutaneous, cutaneous, and oropharyngeal candidiasis either resistant to fluconazole or itraconazole or in patients intolerant of these antifungals

**Cautions** predisposition to adrenocortical insufficiency; interactions: Appendix 1 (antifungals, imidazole)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely; risk of hepatotoxicity greater if given for longer than 10 days. Monitor liver function before treatment, then on weeks 2 and 4 of treatment, then every month. Avoid or use with caution if abnormal liver function test results (avoid in active liver disease) or if history of hepatotoxicity with other drugs

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, or dark urine develop

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** avoid; see also Hepatotoxicity above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk (teratogenicity in animal studies)

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, vomiting, abdominal pain; pruritus; less commonly, diarrhoea, headache, dizziness, drowsiness, and rash; also reported fatal liver damage (see Hepatotoxicity above), dyspepsia, raised intracranial pressure, paraesthesia, adrenocortical insufficiency, erectile dysfunction, menstrual disorders, azoospermia (with high doses), gynaecomastia, thrombocytopenia, photophobia, photosensitivity, and alopecia

**Dose**
- 200 mg once daily, increased if response inadequate to 400 mg once daily; continued until symptoms have cleared and cultures negative, but see Cautions (max. duration of treatment 4 weeks for *Malassezia* infection); **CHILD** body-weight 15–30 kg, 100 mg once daily; body-weight over 30 kg, adult dose

**Vfend®** (Pfizer)
- **Tablets**, f/c, voriconazole 50 mg, net price 28-tablet pack = £275.68; 200 mg, 28-tab pack = £1102.74. Label: 9, 11, 23
- **Oral suspension**, voriconazole 200 mg/5 mL when reconstituted with water; net price 75 mL (orange-flavoured) = £551.37. Label: 9, 11, 23
- **Intravenous infusion**, powder for reconstitution, voriconazole, net price 200 mg vial = £77.14

**Excipients** include sulphobutylether beta cyclodextrin sodium (risk of accumulation in renal impairment)

**Electrolytes** Na⁺ 9.47 mmol/vial

**BNF for Children**

**5.2.2 Imidazole antifungals**

The imidazole antifungals include clotrimazole, econazole, ketoconazole, and toconazole. They are used for the local treatment of vaginal candidiasis (section 7.2.2) and for dermatophyte infections (section 13.10.2).

**Ketoconazole** is better absorbed by mouth than other imidazoles. However, its use is restricted because it is associated with fatal hepatotoxicity (see below).

**Miconazole** (section 12.3.2) can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.
5.2.3 Polyene antifungals

The polyene antifungals include amphotericin and nystatin; neither drug is absorbed when given by mouth. Amphotericin is used for oral, oropharyngeal, and perirectal infections by local application in the mouth (section 13.10.2). Nystatin is also used for Candida albicans infection of the skin (section 13.10.2).

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive. For the role of amphotericin in the systemic treatment of fungal infections, see p. 572.

**AMPHOTERICIN**

**(Amphotericin B)**

**Indications** See under Dose

**Cautions** when given parenterally, toxicity common (close supervision necessary and test dose required; see Anaphylaxis below); hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required; corticosteroids (avoid except to control reactions); avoid rapid infusion (risk of arrhythmias); interactions: Appendix 1 (amphotericin)

Anaphylaxis Anaphylaxis occurs rarely with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential)

Renal impairment use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation

Pregnancy not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk

Breast-feeding no information available

**Side-effects** when given parenterally, anorexia, nausea and vomiting, diarrhoea, epigastric pain; febrile reactions, headache, muscle and joint pain; anaemia; disturbances in renal function (including hypokalaemia and hypomagnesaemia) and renal toxicity; also cardiovascular toxicity (including arrhythmias, blood pressure changes), blood disorders, neurological disorders (including hearing loss, diplopia, convulsions, peripheral neuropathy, encephalopathy), abnormal liver function (discontinue treatment), rash, anaphylactoid reactions (see Anaphylaxis, above); pain and thrombophlebitis at injection site

**Dose**

- By intravenous infusion, see preparations

*Note* Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

**Lipid formulations**

Abelcet® (Cephalon) (ω)

**Intravenous infusion**, amphotericin 5 mg/mL as lipid complex with 1-α-dimyristoylphosphatidylcholine and 1-α-dimyristoylphosphatidylglycerol, net price 20-mL vial = £77.43 (hosp. only)

**Electrolytes** Na⁺ 3.12 mmol/vial

**Dose** by intravenous infusion, severe invasive candidiasis; severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients; initial test dose 1 mg over 10 minutes then 5 mg/kg once daily for at least 14 days.

CHILD under 18 years see BNF for Children

AmBisome® (Gilead) (ω)

**Intravenous infusion**, powder for reconstitution, amphotericin 50 mg encapsulated in liposomes, net price 50-mg vial = £96.69

**Electrolytes** Na⁺ < 0.5 mmol/vial

**Excipients** include sucrose 900 mg/vial

**Dose** by intravenous infusion, severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin, aspergillosis, initial test dose 1 mg over 10 minutes then 3 mg/kg once daily; max. 5 mg/kg once daily (unlicensed dose). CHILD under 18 years see BNF for Children

Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibiotics, initial test dose 1 mg over 10 minutes then 3 mg/kg once daily until afebrile for 3 consecutive days; max. period of treatment 42 days; max. 5 mg/kg once daily (unlicensed dose). CHILD under 18 years see BNF for Children

Visceral leishmaniasis, see section 5.4.5 and product literature

5.2.4 Echinocandin antifungals

The echinocandin antifungals include anidulafungin, caspofungin and micafungin. They are only active against Aspergillus spp. and Candida spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. For the role of echinocandin antifungals in the prevention and systemic treatment of fungal infections, see p. 572.

**ANIDULAFUNGIN**

**Indications** invasive candidiasis (see notes above)

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies

**Side-effects** diarrhoea, nausea, vomiting, flushing, convulsion, headache, coagulopathy, hypokalaemia, raised serum creatinine, rash, pruritus, loose, commonly abdominal pain, cholestatic, hypertension, hyper-
glycaemia, urticaria, injection-site pain; also reported, hypotension, dyspnoea, bronchospasm, hepatitis

**Dose**
- **By intravenous infusion,** ADULT over 18 years, 200 mg on first day then 100 mg once daily

**Ecalta** *(Pfizer) ▼ ▼
Intravenous infusion, powder for reconstitution, anidulafungin, net-price 100-mg vial = £299.99

---

**CASPOFUNGIN**

**Indications** invasive aspergillosis (see notes above); invasive candidiasis (see notes above); empirical treatment of systemic fungal infections in patients with neutropenia

**Cautions** interactions: Appendix 1 (caspofungin)

**Hepatic impairment** 70 mg on first day then 35 mg once daily in moderate impairment; no information available for severe impairment

**Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies

**Breast-feeding** present in milk in animal studies—manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhea, abdominal pain; headache; fever; hypokalaemia; hypomagnesaemia; hypocalcaemia; leucopenia, anaemia; rash; phlebitis; less commonly dyspepsia, constipation, hepatomegaly, hepatitis and cholestasis (see also Hepatotoxicity above), taste disturbances, anorexia, tachycardia, palpitation, bradycardia, blood pressure changes, flushing, dyspnoea, sleep disturbances, anxiety, confusion, dizziness, tremor, pancytopenia, thrombocytopenia, eosinophilia, hyponatraemia, hypophosphataemia, hyperkalaemia, hyperhidrosis, and pruritus; rarely haemolytic anaemia; also reported renal failure (more frequent in children)

**Dose**
- **By intravenous infusion,** invasive candidiasis, ADULT body-weight over 40 kg, 100 mg once daily (increased to 200 mg daily if inadequate response) for at least 14 days; body-weight under 40 kg, 2 mg/kg once daily (increased to 4 mg/kg daily if inadequate response) for at least 14 days; **CHILD** under 18 years see BNF for Children

Oesophageal candidiasis, **ADULT** body-weight over 40 kg, 150 mg once daily; body-weight under 40 kg, 3 mg/kg once daily; **CHILD** 18–18 years see BNF for Children

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days, **ADULT** body-weight over 40 kg, 50 mg once daily; body-weight under 40 kg, 1 mg/kg once daily; continue for at least 7 days after neutrophil count in desirable range; **CHILD** under 18 years see BNF for Children

**Mycamine** *(Astellas) ▼ ▼
Intravenous infusion, powder for reconstitution, micafungin (as sodium), net price 50-mg vial = £196.08; 100-mg vial = £341.00

**Flucytosine** is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in AIDS patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. For the role of flucytosine in the treatment of systemic candidiasis and cryptococcal meningitis, see p. 373. Griseofulvin is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months. For the role of griseofulvin in the treatment of tinea capitis, see p. 373. Terbinfine is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate (see p. 373).
**FLUCYTOSINE**

**Indications** systemic yeast and fungal infections; adjunct to amphotericin in cryptococcal meningitis (see Cryptococcosis, p. 373), adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

**Cautions** elderly; blood disorders; liver- and kidney-function tests and blood counts required (weekly in blood disorders); **interactions:** Appendix 1 (flucytosine)

**Renal impairment** liver- and kidney-function tests and blood counts required weekly; use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration

**Pregnancy** teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhoea, rashes; less frequently cardiotoxicity, confusion, hallucinations, convulsions, headache, sedation, vertigo, alterations in liver function tests (hepatitis and hepatic necrosis reported), and toxic epidermal necrolysis; blood disorders including thrombocytopenia, leucopenia, and aplastic anaemia reported

**Dose**
- By intravenous infusion over 20–40 minutes, 200 mg/kg daily in 4 divided doses usually for not more than 7 days; extremely sensitive organisms, 100–150 mg/kg daily may be sufficient; **CHILD** under 18 years see **BNF for Children**
- Cryptococcal meningitis (adjunct to amphotericin, see Cryptococcosis, p. 373) 100 mg/kg daily in 4 divided doses for 2 weeks [unlicensed duration]; **CHILD** under 18 years see **BNF for Children**

**Note** For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre)

**Ancotil** (Meda) **Intravenous infusion**, flucytosine 10 mg/mL, net price 250 mL infusion bottle = £30.33 (hosp. only)

**ELECTROLYTES Na+ 34.5 mmol/250-mL bottle**

**Note** Flucytosine tablets [unlicensed] may be available from ‘special-order’ manufacturers or specialist-importing companies, see p. 988

---

**GRISEOFULVIN**

**Indications** dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

**Cautions** interactions: Appendix 1 (griseofulvin)

**Driving** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** severe liver disease; systemic lupus erythematosus (risk of exacerbation); acute porphyria (section 9.8.2)

**Hepatic impairment** avoid in severe liver disease

**Pregnancy** avoid (fetotoxicity and teratogenicity in animals); effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required); also men should avoid fathering a child during and for at least 6 months after administration

**Breast-feeding** avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea; headache; also reported, abdominal pain, dyspepsia, hepatotoxicity, glossitis, taste disturbances, sleep disturbances, dizziness, fatigue, confusion, agitation, depression, impaired coordination and hearing, peripheral neuropathy, menstrual disturbances, renal failure, leucopenia, systemic lupus erythematosus, rash (including rarely erythema multiforme, toxic epidermal necrolysis), and photosensitivity

**Dose**
- Dermatophyte infections, 500 mg once daily or in divided doses; in severe infection may be doubled, reducing when response occurs; **CHILD** under 50 kg, 10 mg/kg once daily or in divided doses
- Tinea capitis caused by Trichophyton tonsurans, 1 g once daily or in divided doses; **CHILD** under 50 kg, 15–20 mg/kg once daily or in divided doses

**Note** Griseofulvin doses in **BNF** may differ from those in product literature

**Griseofulvin** (Non-proprietary) **Tablets**, griseofulvin 125 mg, net price 100 = £34.86; 500 mg, 100 = £90.34. Label: 9, 21, counselling, driving

**Fulsovin** (Kappin) **Oral suspension**, griseofulvin 125 mg/5 mL, net price 100 mL (peppermint-flavoured) = £59.90. Label: 9, 21, counselling, driving

---

**TERBINAFINE**

**Indications** dermatophyte infections of the nails, ringworm infections (including tinea pedis, cruris, and corporis) where oral therapy appropriate (due to site, severity or extent)

**Cautions** psoriasis (risk of exacerbation); autoimmune disease (risk of lupus-erythematosus-like effect); **interactions:** Appendix 1 (terbinafine)

**Hepatic impairment** manufacturer advises avoid—elimination reduced

**Renal impairment** use half normal dose if eGFR less than 50 mL/minute/1.73 m2 and no suitable alternative available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** avoid—present in milk

**Side-effects** abdominal discomfort, anorexia, nausea, diarrhoea; headache; rash and urticaria occasionally with arthralgia or myalgia; less commonly taste disturbance; rarely liver toxicity (including jaundice, cholestasis and hepatitis)—discontinue treatment, angioedema, dizziness, malaise, paraesthesia, hypoaesthesia, photosensitivity, serious skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—discontinue treatment if progressive skin rash; very rarely psychiatric disturbances, blood disorders (including leucopenia and thrombocytopenia), lupus erythematosus-like effect, and exacerbation of psoriasis

**Dose**
- **By mouth**. 250 mg daily usually for 2–6 weeks in tinea pedis, 2–4 weeks in tinea cruris, 4 weeks in tinea corporis, 6 weeks–3 months in nail infections (occas-
sionally longer in toenail infections); CHILD [unlicensed] usually for 4 weeks, tinea capitis, over 1 year, body-weight 10–20 kg, 62.5 mg once daily; body-weight 20–40 kg, 125 mg once daily; body-weight over 40 kg, 250 mg once daily

**Terbinafine** (Non-proprietary) Tablets, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £2.33, 28-tab pack = £3.02. Label: 9

**Lamisil** (Novartis) Tablets, off-white, scored, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £21.30, 28-tab pack = £41.09. Label: 9

### 5.3 Antiviral drugs

#### 5.3.1 HIV infection

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

**Principles of treatment** Treatment is aimed at reducing the plasma viral load as much as possible and for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

**Initiation of treatment** The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count; the plasma viral load and clinical symptoms may also help. The timing and choice of treatment should also take account of the possible effects of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as ‘highly active antiretroviral therapy’. Treatment is initiated with 2 nucleoside reverse transcriptase inhibitors and a non-nucleoside reverse transcriptase inhibitor; the regimen of choice contain either tenofovir, emtricitabine, and efavirenz or abacavir, lamivudine, and efavirenz. Regimens containing 2 nucleoside reverse transcriptase inhibitors and a boosted protease inhibitor are reserved for patients with resistance to first-line regimens, women wishing to become pregnant, or patients with psychiatric illness. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases (section 5.3.3).

**Switching therapy** Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

**Pregnancy** Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although the teratogenic potential of most antiretroviral drugs is unknown), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist.** Tenofovir/emtricitabine/efavirenz/ranuvir (tenofovir, emtricitabine, efavirenz and abacavir) is the recommended regimen for pregnant women and breastfeeding mothers. Women who are planning pregnancy should be switched to this regimen if they are on a different regimen.

**Breast-feeding** Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

**Children** HIV disease in children has a different natural course from that in adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

**Post-exposure prophylaxis** Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer’s Expert Advisory Group on AIDS, www.dh.gov.uk) and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org

**Drugs for HIV infection** Zidovudine, a nucleoside reverse transcriptase inhibitor (or ‘nucleoside analogue’), was the first anti-HIV drug to be introduced.
Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine, emtricitabine, lamivudine, stavudine, and tenofovir.

The protease inhibitors include atazanavir, darunavir, fosamprenavir (a pro-drug of amprenavir), indinavir, lopinavir, nefinavir, ritonavir, saquinavir, and tipranavir. Ritonavir in low doses boosts the activity of the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV. The Scottish Medicines Consortium (p. 4) has advised (March 2008) that maraviroic (Celsentri®) is not recommended for use within NHS Scotland.

Raltegravir is an inhibitor of HIV integrase. It is licensed for the treatment of HIV infection in combination with other antiretroviral drugs. The Scottish Medicines Consortium (p. 4) has advised (April 2010) that raltegravir (Santrest®) is accepted for restricted use within NHS Scotland for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

**Immune reconstitution syndrome** Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms.

**Lipodystrophy syndrome** Metabolic effects associated with antiretroviral treatment include fat redistribution, insulin resistance, and dyslipidaemia; collectively these have been termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting antiretroviral therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then annually.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, ‘buffalo hump’ and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine (especially in combination with didanosine), and to a lesser extent zidovudine, are associated with a higher risk of lipoatrophy and should be used only if alternative regimens are not suitable. Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia. Of the protease inhibitors, atazanavir and darunavir may be less likely to cause dyslipidaemia, while saquinavir and atazanavir may be less likely to impair glucose tolerance.

**Osteonecrosis** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

### Nucleoside reverse transcriptase inhibitors

#### Cautions

**Lactic acidosis** Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors. They should be used with caution in patients (particularly obese women) with hepatomegaly, hepatitis (especially hepatitis C treated with interferon α and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis (including alcohol abuse). Treatment with the nucleoside reverse transcriptase inhibitor should be discontinued in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function. Stavudine, especially in combination with didanosine, is associated with a higher risk of lactic acidosis and should be used only if alternative regimens are not suitable.

**Hepatic impairment** Nucleoside reverse transcriptase inhibitors should be used with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects); see also Lactic acidosis above.

**Pregnancy** see p. 381

**Breast-feeding** see p. 381

#### Side-effects

Side-effects of the nucleoside reverse transcriptase inhibitors include gastro-intestinal disturbances (such as nausea, vomiting, abdominal pain, flatulence and diarrhoea), anorexia, pancreatitis, liver damage (see also Lactic Acidosis, above), dyspnoea, cough, headache, insomnia, dizziness, fatigue, blood disorders (including anaemia, neutropenia, and thrombocytopenia), myalgia, arthralgia, rash, urticaria, and fever. See notes above for metabolic effects and lipodystrophy (Lipodystrophy Syndrome), and Osteonecrosis.
**ABACAVIR**

**Indications**  HIV infection in combination with other antiretroviral drugs

**Cautions**  see notes above; also test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele; HIV load greater than 100,000 copies/mL; patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); interactions:  Appendix 1 (abacavir)

**Hypersensitivity reactions**  Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis, laboratory abnormalities may include raised liver function tests (see Lactic Acidosis p. 382) and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time; monitor for symptoms every 2 weeks for 2 months; discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available, care needed with concomitant use of drugs which cause skin toxicity

**Counselling**  Patients should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation); how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment; patients should be advised to keep Alert Card with them at all times

**Hepatic impairment**  see notes above; also avoid in moderate impairment unless essential; avoid in severe impairment

**Renal impairment**  manufacturer advises avoid in end-stage renal disease; avoid Kivexa® or Trizivir® if eGFR less than 50 mL/minute/1.73 m² (consult product literature)

**Pregnancy**  manufacturer advises avoid (toxicity in animal studies); see also p. 381

**Breast-feeding**  see p. 381

**Side-effects**  see notes above; also hypersensitivity reactions (see above); very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; rash and gastrointestinal disturbances more common in children

**Dose**

- 600 mg daily in 1–2 divided doses; **CHILD** 3 months–12 years, 8 mg/kg every 12 hours (max. 600 mg daily) or body-weight 14–21 kg, 150 mg every 12 hours; body-weight 21–30 kg, 150 mg in the morning and 300 mg in the evening; body-weight over 30 kg, 300 mg every 12 hours

**Ziagen® (ViiV) (c)**

- Tablets, yellow, f/c, scored, abacavir (as sulphate) 300 mg, net price 60-tab pack = £208.95. Counselling, hypersensitivity reactions

**With lamivudine**

For **cautions, contra-indications and side-effects** see under individual drugs

**Kivexa® (ViiV) (c)**

- Tablets, orange, f/c, abacavir (as sulphate) 600 mg, lamivudine 300 mg, net price 30-tab pack = £352.25. Counselling, hypersensitivity reactions

**Dose**  **ADULT** and **CHILD** over 12 years, body-weight over 40 kg; 1 tablet daily

**With lamivudine and zidovudine**

**Note**  For patients stabilised (for 6–8 weeks) on the individual components in the same proportions. For **cautions, contra-indications and side-effects** see under individual drugs

**Trizivir® (ViiV) (c)**

- Tablets, blue-green, f/c, abacavir (as sulphate) 300 mg, lamivudine 150 mg, zidovudine 300 mg, net price 60-tab pack = £509.06. Counselling, hypersensitivity reactions

**Dose**  **ADULT** over 18 years, 1 tablet twice daily

**DIDANOSINE**

(ddi, DDI)

**Indications**  HIV infection in combination with other antiretroviral drugs

**Cautions**  see notes above; also history of pancreatitis (preferably avoid, otherwise extreme caution, see also below); peripheral neuropathy or hyperuricaemia (see under Side-effects); ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur; interactions:  Appendix 1 (didanosine)

**Pancreatitis**  Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isethionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated

**Hepatic impairment**  see notes above; also insufficient information but monitor for toxicity

**Renal impairment**  reduce dose if eGFR less than 60 mL/minute/1.73 m²; consult product literature

**Pregnancy**  manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding**  see p. 381

**Side-effects**  see notes above; also pancreatitis (see also under Cautions), liver failure, anaphylactic reactions, peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), diabetes mellitus, hypo- or hyperglycaemia, acute renal failure, rhabdomyolysis, dry eyes, retinal and optic nerve changes, dry mouth, parotid gland enlargement, salalodenitis, alopecia, hyperuricaemia (suspend if raised significantly)

**Dose**

- **ADULT** under 60 kg 250 mg daily in 1–2 divided doses, 60 kg and over 400 mg daily in 1–2 divided doses; **CHILD** over 3 months (under 6 years Videx® tablets only), 240 mg/m² daily (180 mg/m² daily in combination with zidovudine) in 1–2 divided doses

---

**BNF 61**

5.3.1 HIV infection 383
**EMTRICITABINE (FTC)**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); **interactions**: Appendix 1 (emtricitabine)

**Hepatic impairment** see notes above and Cautions above

**Renal impairment** reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature

**Pregnancy** no information available—manufacturer advises use only if essential

**Breast-feeding** can be used with caution in women infected with chronic hepatitis B alone, providing adequate measures are taken to prevent hepatitis B infection in infants; for women infected with HIV, see p. 381

**Side-effects** see notes above; also peripheral neuropathy, muscle disorders including rhabdomyolysis, nasal symptoms, alopecia

**Dose**
- See preparations below

**Epivir® (ViiV)**

- Tablets, every 12 hours
  - Formalin (3TC) capsules, 150 mg, net price 60-tab pack = £143.32; 300 mg (grey), 30-tab pack = £157.51
  - Oral solution, banana- and strawberry-flavoured, lamivudine 50 mg/5 mL, net price 240-mL pack = £39.01
- **Excipients** include sucrose 1 g/5 mL

- **Dose** HIV infection in combination with other antiretroviral drugs, 150 mg every 12 hours or 300 mg once daily; **CHILD** 3 months–12 years, 4 mg/kg (max. 150 mg) every 12 hours or body-weight 14–21 kg, 75 mg twice daily; body-weight 21–30 kg, 75 mg in the morning and 150 mg in the evening; body-weight over 30 kg, 150 mg twice daily

**Zeffix® (ViiV)**

- Tablets, brown, 150 mg, net price 28-tab pack = £78.09
- **Excipients** include sucrose 1 g/5 mL

- **Dose** chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) or with decompensated liver disease, 150 mg every 12 hours, or body-weight 14–21 kg, 75 mg twice daily; body-weight 21–30 kg, 75 mg in the morning and 150 mg in the evening; body-weight over 30 kg, 150 mg twice daily

**Note** Patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

- **With abacavir**
  - See under Abacavir
- **With zidovudine**
  - See under Zidovudine
- **With efavirenz and tenofovir**
  - See under Tenofovir

**LAMIVUDINE (3TC)**

**Indications** see preparations below

**Cautions** see notes above; **interactions**: Appendix 1 (lamivudine)

**Chronic Hepatitis B** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lami-

**Dose**
- **ADULT** oral solution
  - 240 mg oral solution = 200 mg capsule; where appropriate the capsule may be used instead of the oral solution

- **With tenofovir**
  - See under Tenofovir

- **With efavirenz and tenofovir**
  - See under Tenofovir

**STAVUDINE (d4T)**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also history of peripheral neuropathy (see under Side-effects); history of pan-
creatitis or concomitant use with other drugs associated with pancreatitis; interactions: Appendix 1 (stavudine)

**Hepatic impairment** see notes above

**Renal impairment** use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m²; use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m²

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; also peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), abnormal dreams, cognitive dysfunction, drowsiness, depression, pruritus; less commonly anxiety, gynaecomastia

**Dose**

- **ADULT** under 60 kg, 30 mg every 12 hours preferably at least 1 hour before food; 60 kg and over, 40 mg every 12 hours; **NEONATE** under 2 weeks, 50 micrograms/kg every 12 hours; **CHILD** over 2 weeks, body-weight under 30 kg, 1 mg/kg every 12 hours; body-weight 30 kg and over, adult dose

**Atripla** (Gilead)

- Tablets, f/c, efavirenz 600 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £255.00. Label: 21, counselling, administration

Counselling Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

**Dose** HIV infection in combination with other antiretroviral drugs, **ADULT** over 18 years, 1 tablet once daily

**With emtricitabine**

For cautions, contra-indications, and side-effects see under individual drugs

**Truvada** (Gilead)

- Tablets, blue, f/c, tenofovir disoproxil (as fumarate) 245 mg, emtricitabine 200 mg, net price 30-tab pack = £418.50. Label: 21, counselling, administration

Counselling Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

**Dose** HIV infection in combination with other antiretroviral drugs, **ADULT** over 18 years, 1 tablet once daily

**With efavirenz and emtricitabine**

For cautions, contra-indications, and side-effects see under individual drugs

**Tenofovir Disoproxil**

- **Indications** HIV infection in combination with other antiretroviral drugs; chronic hepatitis B infection with either compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) or decompensated liver disease

- **Cautions** see notes above; also test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases; concomitant or recent use of nephrotoxic drugs; on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); interactions: Appendix 1 (tenofovir)

**Hepatic impairment** see notes above and Cautions above

**Renal impairment** monitor renal function—interrupt treatment if further deterioration; 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m²; avoid **Atripla** if eGFR less than 50 mL/minute/1.73 m²; use normal dose of **Truvada** every 2 days if eGFR 30–50 mL/minute/1.73 m²; avoid **Truvada** if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** no information available—manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; hypophosphataemia; rarely renal failure, proximal renal tubulopathy, nephrogenic diabetes insipidus; also reported reduced bone density

**Dose**

- **ADULT over 18 years, 245 mg once daily**

**Viread** (Gilead) ▼ (TA)

- Tablets, f/c, blue, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £255.00. Label: 21, counselling, administration

Counselling Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

**Dose** HIV infection in combination with other antiretroviral drugs, **ADULT** over 18 years, 1 tablet once daily

**Zidovudine** (Azidothymidine, AZT)

- **Note** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug

- **Indications** HIV infection in combination with other antiretroviral drugs; prevention of maternal-fetal HIV transmission (see notes above under Pregnancy and Breast-feeding)

- **Cautions** see notes above; also haematological toxicity particularly with high dose and advanced disease—monitor full blood count after 4 weeks of treatment, then every 3 months; vitamin B₁₂ deficiency (increased risk of neutropenia); if anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment; elderly; interactions: Appendix 1 (zidovudine)

- **Contra-indications** abnormally low neutrophil counts or haemoglobin concentration (consult product literature); neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature); acute porphyria (section 9.8.2)

**Hepatic impairment** see notes above; also accumulation may occur

**Renal impairment** reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m²; avoid **Combivir** if eGFR less than 50 mL/minute/1.73 m² (consult product literature)

**Pregnancy** limited information available; manufacturer advises use only if clearly indicated; see also p. 381
Breast-feeding see p. 381

Side-effects see notes above; also anaemia (may require transfusion), taste disturbance, chest pain, influenza-like symptoms, paraesthesia, neuropathy, convulsions, dizziness, drowsiness, anxiety, depression, loss of mental acuity, myopathy, gynaecomastia, urinary frequency, sweating, pruritus, pigmentation of nails, skin and oral mucosa.

Dose

- By mouth, ADULT body-weight over 30 kg, 250–300 mg twice daily; CHILD body-weight 4–9 kg, 12 mg/kg twice daily; body-weight 9–30 kg, 9 mg/kg twice daily or body-weight 8–14 kg, 100 mg twice daily; body-weight 14–21 kg, 100 mg in the morning and 200 mg in the evening; body-weight 21–28 kg, 200 mg twice daily; body-weight 28–30 kg, 200–250 mg twice daily.
- Prevention of maternal-fetal HIV transmission, seek specialist advice (combination therapy preferred).
- Patients temporarily unable to take zidovudine by mouth, by intravenous infusion over 1 hour, 0.8–1 mg/kg every 4 hours (approximating to 1.2–1.5 mg/kg every 4 hours by mouth) usually for not more than 2 weeks; CHILD 3 months; 60–80 mg/m² every 6 hours (approximating to 9–12 mg/kg twice daily by mouth).

Zidovudine (Non-proprietary) Capsules, zidovudine 100 mg, net price 60-cap pack = £50.17; 250 mg, 60-cap pack = £125.44.

Retrovir® (ViiV) Capsules, zidovudine 100 mg (white/blue band), net price 100-cap pack = £104.54; 250 mg (blue/white/ dark blue band), 40-cap pack = £104.54.

Oral solution, sugar-free, strawberry-flavoured, zidovudine 50 mg/5 mL, net price 200-mL pack with 10-mL oral syringe = £20.91.

Injection, zidovudine 10 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL vial = £10.50.

Avoid with lamivudine

For cautions, contra-indications, and side-effects see under individual drugs.

Combivir® (ViiV) Tablets, f/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £30.12.

Dose ADULT and CHILD body-weight 8–14 kg, 1 tablet twice daily; CHILD body-weight 14–21 kg, half a tablet twice daily; body-weight 21–30 kg, half a tablet in the morning and one tablet in the evening.

Note Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

Avoid with abacavir and lamivudine

See under Abacavir and Lamivudine.

Protease inhibitors

Cautions Protease inhibitors are associated with hyperglycaemia and should be used with caution in diabetes (see Lipodystrophy Syndrome, p. 382). Caution is also needed in patients with haemophilia who may be at increased risk of bleeding.

Contra-indications Protease inhibitors should not be given to patients with acute porphyria (but see section 9.8.2).

Hepatic impairment Protease inhibitors should be used with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

Pregnancy See p. 381

Breast-feeding See p. 381

Side-effects Side-effects of the protease inhibitors include gastro-intestinal disturbances (including diarrhoea, nausea, vomiting, abdominal pain, flatulence), anorexia, hepatic dysfunction, pancreatitis; blood disorders including anaemia, neutropenia, and thrombocytopenia; sleep disturbances, fatigue, headache, dizziness, paraesthesia, myalgia, myositis, rhabdomyolysis; taste disturbances; rash, pruritus, Stevens-Johnson syndrome, hypersensitivity reactions including anaphylaxis; see also notes above for lipodystrophy and metabolic effects (Lipodystrophy Syndrome), and Osteonecrosis.

ATAZANAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also concomitant use with drugs that prolong PR interval; cardiac conduction disorders; predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); interactions: Appendix 1 (atazanavir).

Contra-indications see notes above.

Hepatic impairment see notes above; also manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

Pregnancy manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinemia in neonate if used at term.

Breast-feeding see p. 381

Side-effects see notes above; also AV block (in children); less commonly mouth ulcers, dry mouth, hypertension, syncope, chest pain, dyspnoea, peripheral neuropathy, abnormal dreams, amnesia, disorientation, depression, anxiety, weight changes, increased appetite, gynaecomastia, nephrolithiasis, urinary frequency, haematuria, proteinuria, arthralgia, and alopecia; rarely hepatosplenomegaly, oedema, palpitation, and abnormal gait; also reported, cholelithiasis, cholecystitis, and torsade de pointes.

Dose

- With low-dose ritonavir, 300 mg once daily; CHILD over 6 years, body-weight 15–20 kg, 150 mg once daily; body-weight 20–40 kg, 200 mg once daily; body-weight over 40 kg, adult dose.

Reyataz® (Bristol-Myers Squibb) Capsules, atazanavir (as sulphate) 150 mg (dark blue/light blue), net price 60-cap pack = £303.38; 200 mg (dark blue), 60-cap pack = £303.38; 300 mg (red/blue), 30-cap pack = £303.38. Label: 5, 21.

DARUNAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also sulfonamide sensitivity; monitor liver function before and during treatment; interactions: Appendix 1 (darunavir).

Rash Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without...
stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution in mild to moderate impairment; avoid in severe impairment — no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk — no information available

**Breast-feeding** see p. 381

**Side-effects** see notes above; also haematemesis, myocardial infarction, angina, QT interval prolongation, syncope, bradycardia, tachycardia, palpitation, hypertension, flushing, peripheral oedema, dyspnoea, cough, peripheral neuropathy, anxiety, confusion, memory impairment, depression, abnormal dreams, convulsions, increased appetite, weight changes, pyrexia, hypothyroidism, osteoporosis, gynaecomastia, erectile dysfunction, reduced libido, dysuria, polyuria, nephrolithiasis, renal failure, arthralgia, visual disturbances, dry eyes, conjunctival hyperaemia, rhinorrhea, throat irritation, dry mouth, stomatitis, nail discoloration, acne, seborrhoeic dermatitis, eczema, increased sweating, alopecia.

**Dose**

- With low-dose ritonavir, **ADULT** and **CHILD** over 6 years, body-weight over 40 kg, previously treated with antiretroviral therapy, 600 mg twice daily; **CHILD** over 6 years, previously treated with antiretroviral therapy, body-weight 20–30 kg, 375 mg twice daily; body-weight 30–40 kg, 450 mg twice daily.
- With low-dose ritonavir, **ADULT** over 18 years not previously treated with antiretroviral therapy, 800 mg once daily.
- **Missed dose** if a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

**Prezista®** (Janssen-Cilag)

- **Tablets**, f/c, darunavir (as ethanolate) 75 mg (white), net price 480-tab pack = £446.70; 150 mg (white), 240-tab pack = £446.70; 400 mg (light orange), 60-tab pack = £297.80; 600 mg (orange), 60-tab pack = £446.70. Label: 21.

**FOSAMPRENAVIR**

- **Note** Fosamprenavir is a pro-drug of amprenavir

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; **interactions**: Appendix 1 (fosamprenavir)

- **Rash** Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption — usually resolves within 2 weeks and may respond to antihistamines.

- **Contra-indications** see notes above

- **Hepatic impairment** see notes above; also manufacturer advises caution in mild impairment; reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment.

- **Pregnancy** toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk.

- **Breast-feeding** see p. 381

**Side-effects** see notes above; also reported, rash including rarely Stevens-Johnson syndrome (see also Rash above)

**Dose**

- With low-dose ritonavir, **ADULT** and **CHILD** over 6 years, body-weight over 39 kg, 700 mg twice daily; **CHILD** over 6 years, body-weight 25–39 kg, 18 mg/kg twice daily.

**Note** 700 mg fosamprenavir is equivalent to approx. 600 mg amprenavir

**Telzir®** (ViiV)

- **Tablets**, f/c, pink, fosamprenavir (as calcium) 700 mg, net price 60-tab pack = £258.97.

- **Oral suspension**, fosamprenavir (as calcium) 50 mg/mL, net price 225-mL pack (grape-bubblegum-and peppermint-flavoured) (with 10-mL oral syringe) = £299.06.

**Counselling** In adults, oral suspension should be taken on an empty stomach; in children under 18 years, oral suspension should be taken with food.

**INDINAVIR**

**Indications** HIV infection in combination with nucleoside reverse transcriptase inhibitors

- **Cautions** see notes above; also ensure adequate hydration (risk of nephrolithiasis especially in children); patients at risk of nephrolithiasis (monitor for nephrolithiasis); patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); **interactions**: Appendix 1 (indinavir)

- **Contra-indications** see notes above

- **Hepatic impairment** see notes above; also increased risk of nephrolithiasis; reduce dose in mild to moderate impairment; not studied in severe impairment.

- **Renal impairment** use with caution; monitor for nephrolithiasis

- **Pregnancy** toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term

- **Breast-feeding** see p. 381

- **Side-effects** see notes above; also reported, dry mouth, hypoesthesia, dry skin, hyperpigmentation, alopecia, paronychia, interstitial nephritis (with medullary calcification and cortical atrophy in asymptomatic severe leucocyturia), nephrolithiasis (may require interruption or discontinuation; more frequent in children), dysuria, haematuria, crystalluria, proteinuria, pyuria (in children), pylonephritis; haemolytic anaemia.

**Dose**

- **ADULT** over 18 years, seek specialist advice

**Crixivan®** (MSD)

- **Capsules**, indinavir (as sulphate), 200 mg, net price 360-cap pack = £226.28; 400 mg, 180-cap pack = £226.28. Label: 27.

**Counselling** Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food.

**Note** Dispense in original container (contains desiccant)

**LOPINAVIR WITH RITONAVIR**

**Indications** HIV infection in combination with other antiretroviral drugs

- **Dose**

  - With low-dose ritonavir, **ADULT** over 6 years, body-weight over 39 kg, 700 mg twice daily; **CHILD** over 6 years, body-weight 25–39 kg, 18 mg/kg twice daily.

  **Note** 700 mg fosamprenavir is equivalent to approx. 600 mg amprenavir
5.3.1 HIV infection

**Hepatic impairment** see notes above; also manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** no information available—manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; also reported, fever

**Dose**
- 1.25 g twice daily or 750 mg 3 times daily; **CHILD** 3–13 years, initially 50–55 mg/kg twice daily (max. 1.25 g twice daily) or 25–50 mg/kg 3 times daily (max. 750 mg 3 times daily)

**Viracept** (Roche) Tablets, blue, f/c, nelfinavir (as mesilate) 250 mg, net price 300-tab pack = £257.32. Label: 21

### NELFINAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; interactions: Appendix 1 (nelfinavir, ritonavir)

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** no information available—manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; also reported, fever

**Dose**
- Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days to 600 mg every 12 hours; **CHILD** over 2 years initially 250 mg/m² every 12 hours, increased by 50 mg/m² at intervals of 2–3 days to 350 mg/m² every 12 hours (max. 600 mg every 12 hours)
- Low-dose booster to increase effect of other protease inhibitors, 100–200 mg once or twice daily

**Norvir** (Abbott) Tablets, f/c, ritonavir 100 mg, net price 30-tab pack = £33.70. Label: 21, 25

**Oral solution** sugar-free, ritonavir 400 mg/5 mL, net price 5 × 90-mL packs (with measuring cup) = £403.20. Label: 21, counselling, administration

Counselling Oral solution contains 4% alcohol; bitter taste can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry

With nelfinavir See under Lopinavir with Ritonavir

### RITONAVIR

**Indications** HIV infection in combination with other antiretroviral drugs; low doses used to increase effect of some protease inhibitors

**Cautions** see notes above; concomitant use with drugs that prolong PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); interactions: Appendix 1 (ritonavir)

**Contra-indications** see notes above

**Hepatic impairment** see notes above; avoid oral solution due to propylene glycol content; manufacturer advises use only if potential benefit outweighs risk

**Pregnancy** avoid oral solution due to propylene glycol content; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; also reported, fever

**Dose**
- Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days to 600 mg every 12 hours; **CHILD** over 2 years initially 250 mg/m² every 12 hours, increased by 50 mg/m² at intervals of 2–3 days to 350 mg/m² every 12 hours (max. 600 mg every 12 hours)
- Low-dose booster to increase effect of other protease inhibitors, 100–200 mg once or twice daily

**Norvir** (Abbott) Tablets, f/c, ritonavir 100 mg, net price 30-tab pack = £33.70. Label: 21, 25

**Oral solution** sugar-free, ritonavir 400 mg/5 mL, net price 5 × 90-mL packs (with measuring cup) = £403.20. Label: 21, counselling, administration

Counselling Oral solution contains 4% alcohol; bitter taste can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry

With nelfinavir See under Lopinavir with Ritonavir

### 5 Infections

**Cautions** see notes above; concomitant use with drugs that prolong QT or PR interval; cardiac conduction disorders, structural heart disease; patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); pancreatitis (see below); interactions: Appendix 1 (lopinavir, ritonavir)

**Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also avoid oral solution due to propylene glycol content; manufacturer advises use capsules and tablets in severe impairment

**Renal impairment** avoid oral solution due to propylene glycol content; use tablets with caution in severe impairment

**Pregnancy** avoid oral solution due to high propylene glycol content; manufacturer advises use capsules and tablets only if potential benefit outweighs risk (toxicity in animal studies)

**Breast-feeding** see p. 381

**Side-effects** see notes above; also electrolyte disturbances in children; *less commonly* haemorrhagic colitis, weight changes, chest pain, oedema, anxiety, depression, abnormal dreams, peripheral neuropathy, pyrexia, Cushing’s syndrome, sexual dysfunction, dehydration, arthralgia, tinnitus, dry mouth, acne, alopecia, and sweating; rarely cholecytitis, gastric ulcer, rectal bleeding, myocardial infarction, myocardial infarction, hyperension, palpitation, AV block, deep vein thrombosis, thrombomoblitopites, vasculitis, dyspnoea, cough, appetite changes, agitation, confusion, amnesia, ataxia, hyperpnea, extrapyramidal effects, influenza-like symptoms, hypothyroidism, amenorrhoea, menorrhagia, gynaecomastia, nephrolithiasis, nephritis, albuminuria, haematuria, hypercalciuria, hypophosphataemia, lactic acidosis, hyperuricaemia, visual disturbances, otitis media, dysphagia, mouth ulceration, stomatitis, periodontitis, sialadenitis, eczema, skin discoloration, and nail disorders

**Dose**
- See preparations below

**Kaletra** (Abbott) Tablets, pale yellow, f/c, lopinavir 100 mg, ritonavir 25 mg, net price 60-tab pack = £76.85. Label: 25

**CHILD** over 2 years with body weight under 40 kg and body surface area 0.5–0.9 m², 2 tablets twice daily; body surface area 0.9–1.4 m², 3 tablets twice daily

**Tablets**, yellow, f/c, lopinavir 200 mg, ritonavir 50 mg, net price 120-tab pack = £307.39. Label: 25

**Dose** ADULT and CHILD with body surface area greater than 1.4 m² or body weight 40 kg and over, 2 tablets twice daily

**Note** Alternatively, in adults with a HIV strain that has less than 3 mutations to protease inhibitors, 4 tablets may be taken once daily

**Oral solution**, lopinavir 400 mg, ritonavir 100 mg/5 mL, net price 5 × 60-mL packs = £307.39. Label: 21

**Excipients** include propylene glycol 153 mg/mL (see Excipients, p. 2), alcohol 42%

**Dose** 5 mL twice daily with food; **CHILD** 2–12 years 2.9 mL/m² twice daily with food, max. 5 mL twice daily
SAQUINAVIR

Indications  HIV infection in combination with other antiretroviral drugs

Cautions  see notes above; monitor ECG before starting treatment and then on day 3 or 4 of treatment—discontinue if QT interval over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, or if prolongation of PR interval; concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration); interactions: Appendix 1 (saquinavir)

Counselling  Patients should be told how to recognise signs of arthrythma and advised to seek medical attention if symptoms such as palpitation or syncope develop

Contra-indications  see notes above; predisposition to cardiac arrhythmias (including congenital QT prolongation, bradycardia, history of symptomatic arrhythmias, heart failure with reduced left ventricular ejection fraction, electrolyte disturbances, concomitant use of drugs that prolong QT or PR interval); concomitant use of drugs that increase plasma-saquinavir concentration (avoid unless no alternative treatment available)

Hepatic impairment  see notes above; also manufacturer advises caution in moderate impairment; avoid in decompensated liver disease

Renal impairment  see notes above; also monitor ECG before starting treatment and then on day 3 or 4 of treatment—discontinue if QT interval over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, or if prolongation of PR interval; concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration); interactions: Appendix 1 (saquinavir)

Breast-feeding  see p. 381

Side-effects  see notes above; also dyspnoea, anaesthesia, peripheral neuropathy, influenza-like symptoms, renal impairment and photosensitivity; rarely dehydration

Dose  • See preparations

Aptivus® (Boehringer Ingelheim)▼

Capsules, pink, tipranavir 250 mg, net price 120–cap pack = £441.00. Label: 5, 21

Dose  with low-dose ritonavir, ADULT and ADOLESCENT over 16 years previously treated with antiretroviral therapy, 500 mg every 12 hours

Invinase® (Roche) ▼

Capsules, brown/green, saquinavir (as mesilate) 200 mg, net price 270-cap pack = £226.14. Label: 21, counselling, arrhythmias

Tablets, orange, F/C, saquinavir (as mesilate) 500 mg, net price 120-tab pack = £251.26. Label: 21, counselling, arrhythmias

Non-nucleoside reverse transcriptase inhibitors

EFAVIRENZ

Indications  HIV infection in combination with other antiretroviral drugs

Cautions  elderly; history of mental illness or seizures; monitor liver function if receiving other hepatotoxic drugs; interactions: Appendix 1 (efavirenz)

Rash  Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month

Psychiatric disorders  Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur

Contra-indications  acute porphyria (but see section 9.8.2)

Hepatic impairment  in mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function; avoid in moderate to severe impairment; greater risk of hepatic side-effects in chronic hepatitis B or C

Renal impairment  manufacturer advises caution in severe renal failure—no information available

Pregnancy  manufacturer advises avoid (effective contraception required during treatment and for 12 weeks after treatment); use efavirenz only if no alternative available

Breast-feeding  see p. 381
Side-effects rash including Stevens-Johnson syndrome (see Rash above); abdominal pain, diarrhoea, nausea, vomiting; anxiety, depression, sleep disturbances, abnormal dreams, dizziness, headache, fatigue, impaired concentration (administration at bedtime especially in first 2–4 weeks reduces CNS effects); pruritus; less commonly pancreatitis, hepatitis, flushing, psychosis, mania, suicidal ideation, amnesia, ataxia, tremor, convulsions, gynaecomastia, blurred vision, tinnitus; rarely hepatic failure, photosensitivity; also reported raised serum cholesterol (see Lipodystrophy Syndrome, p. 382); see also Osteonecrosis, p. 382

Dose

> See preparations below

**Sustiva** (Bristol-Myers Squibb)

Capsules, efavirenz 50 mg (yellow/white), net price 30-cap pack = £16.73; 100 mg (white), 30-cap pack = £33.41; 200 mg (yellow), 90-cap pack = £200.27.

Label: 23

Dose ADULT and CHILD over 3 years, body-weight 13–15 kg, 200 mg once daily; body-weight 15–20 kg, 250 mg once daily; body-weight 20–25 kg, 300 mg once daily; body-weight 25–32.5 kg, 350 mg once daily; body-weight 32.5–40 kg, 400 mg once daily; body-weight 40 kg and over, 600 mg once daily

Tablets, f/c, yellow, efavirenz 600 mg, net price 30-tab pack = £200.27. Label: 23

Dose ADULT and CHILD, body-weight over 40 kg, 600 mg once daily

**Oral solution**, sugar-free, strawberry and mint flavour; efavirenz 30 mg/mL, net price 180-mL pack = £38.88.

Dose ADULT and CHILD over 5 years, body-weight 13–15 kg, 270 mg once daily; body-weight 15–20 kg, 300 mg once daily; body-weight 20–25 kg, 360 mg once daily; body-weight 25–32.5 kg, 400 mg once daily; body-weight 32.5–40 kg, 510 mg once daily; body-weight 40 kg and over, 720 mg once daily; CHILD 3–5 years, body-weight 13–15 kg, 360 mg once daily; body-weight 15–20 kg, 390 mg once daily; body-weight 20–25 kg, 450 mg once daily; body-weight 25–32.5 kg, 510 mg once daily

**Note** The bioavailability of Sustiva® oral solution is lower than that of the capsules and tablets; the oral solution is not interchangeable with either capsules or tablets on a milligram-for-milligram basis

*With emtricitabine and tenofovir* See under Tenofovir

**ETRAVIRINE**

**Indications** in combination with other antiretroviral drugs

**Cautions** chronic hepatitis B or C, high CD4 cell count, and women (all at greater risk of hepatic side-effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk); **interactions:** Appendix 1 (nevirapine)

**Hepatic disease** Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; close monitoring required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly, discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction

**Rash** Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased after 14 days; monitor closely for skin reactions during first 18 weeks; discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, and hepatitis. Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks

**Counselling** Patients should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop

**Contra-indications** acute porphyria (but see section 9.8.2)

**BHF IMPAIRMENT** manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** rash (including Stevens-Johnson syndrome rarely and toxic epidermal necrolysis very rarely; see also Hypersensitivity Reactions above); gastro-oesophageal reflux, nausea, abdominal pain, flatulence, gastritis, myocardial infarction, hypertension; peripheral neuropathy, diabetes, hyperlipidaemia (see also Lipodystrophy Syndrome, p. 382); renal failure; anaemia; less commonly pancreatitis, haemorrhagic stroke and hypersensitivity reactions; see also Osteonecrosis, p. 382

**Dose**

> ADULT over 18 years, 200 mg twice daily after food

**Missed dose** If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

**Intolerance** (Janssen-Cilag)

Tablets, etravirine 100 mg, net price 120-tab pack = £301.27. Label: 21, counselling, rash and hypersensitivity reactions

**Note** Dispense in original container (contains desiccant). Patients with swallowing difficulties may disperse tablets in a glass of water just before administration

**NEVIRAPINE**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** chronic hepatitis B or C, high CD4 cell count, and women (all at greater risk of hepatic side-effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk); **interactions:** Appendix 1 (nevirapine)

**Hepatic disease** Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; close monitoring required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly, discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction

**Rash** Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased after 14 days; monitor closely for skin reactions during first 18 weeks; discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, and hepatitis. Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks

**Counselling** Patients should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop

**Contra-indications** acute porphyria (but see section 9.8.2)
Contra-indications acute porphyria (but see section 9.8.2); post-exposure prophylaxis

Hepatic impairment manufacturer advises caution in moderate impairment; avoid in severe impairment; see also Hepatic Disease, above

Pregnancy although manufacturer advises caution, may be appropriate to use if clearly indicated; see also p. 381

Breast-feeding see p. 381

Side-effects rash including Stevens-Johnson syndrome and rarely, toxic epidermal necrolysis (see also Cautions above); nausea, hepatitis (see also Hepatic Disease above), headache; less commonly vomiting, abdominal pain, fatigue, fever, and myalgia; rarely diarrhoea, angioedema, anaphylaxis, hypersensitivity reactions (may involve hepatic reactions and rash, see Hepatic Disease above), arthralgia, anaemia, and granulocytopenia (more frequent in children); see also Osteonecrosis, p. 382

Dose
